Religion—The religious problem had peculiar interest for the school which discerned God everywhere as the ruler and upholder, and at the same time the law, of the world that He had evolved from Himself. The physical ground-work lends a religious sancton to all moral duties, and Cleanthes's noble hymn is evidence how far a system of natural religion could go in providing satisfaction for the cravings of the religious temper;—

iaction for the cravings of the religious temper:—
"Most glorious of mumortals, Jo Zeus of many names, almighty and everlasting, sovereign of nature, directing all in accordance with universe, as it rolls circling round the earth, obey wheresoever thou dost guade, and gladly owns thy sway. Such a mumster thus holdest in thy invincible hands—the two-edged, fiery, everliving thunderbolt, under whose stroke all nature shudders. No work upon earth is wrought apart from the, lord, nor through the drone etherest sphere, own foolshiness. Nay, thou knowest how to make even the rough smooth, and to bring order out of disorder; and things not friendly are friendly in thy sight. For so hast thou fitted all things together, the good with the evil, that there might be one ternal law over all. . . . Deliver men from tell genorance. Banish if, father, from the tool, and the with gustness of the such parts of the s

To the orthodox theology of Greece and Rome the system stood in a twofold relation, as criticism and rationalism. That the popular religion contained gross errors hardly needed to be

STOICS 433

images, shrines, temples, sacrifices, prayers and worship to be of no avail A really acceptable prayer, he taught, can only have reference to a virtuous and devout mind. God is best worshipped in the shrine of the heart by the desire to know and obey Him At the same time the Stoics felt at liberty to defend and uphold the truth in polytheism Not only is the primitive substance God, the one supreme being, but divinity must be ascribed to His manifestations—to the heavenly bodies, which are conceived, like Plato's created gods, as the highest of rational beings, to the forces of nature, even to deified men; and thus the world was peopled with divine agencies. Moreover, the myths were rationalized and allegorized, which was not in either case an original procedure The search for a deeper hidden meaning beside the literal one had been begun by Democritus, Empedocles, the Sonhists and the Cynics It remained for Zeno to carry this to a much greater extent and to seek out or invent "natural principles" (λόγοι φυσικοί) and moral ideas in all the legends and in the poetry of Homer and Hesiod In this sense he was the pat-

tern if not the "father" of all such as allegorize and reconcile.

Stoicism in Rome.—The introduction of Stoicism at Rome was the most momentous of the many changes that it saw After the first sharp collision with the jealousy of the national authorities it found a ready acceptance, and made rapid progress amongst the noblest families. It has been well said that the old heroes of the republic were unconscious Stoics, fitted by their narrowness, their stern simplicity and devotion to duty for the almost Semitic earnestness of the new doctrine In Greece its insensibility to art and the cultivation of life was a fatal defect; not so with the shrewd men of the world, desirous of qualifying as advocates or jurists. It supplied them with an incentive to scientific research in archaeology and grammar; it penetrated jurisprudence until the belief in the ultimate identity of the jus gentium with the law of nature modified the practor's edicts for centuries Even to the prosaic religion of old Rome, with its narrow original conception and multitude of burdensome rites, it became in some sort a support. Scaevola, following Panaetius, explained that the prudence of statesmen had established this public institution in the service of order midway between the errors of popular superstition and the barren truths of enlightened philosophy. Soon the influence of the pupils reacted upon the doctrines taught. Of speculative interest the ordinary Roman had as little as may be; for abstract discussion and controversy he cared nothing Indifferent to the scientific basis or logical development of doctrines. he selected from various writers and from different schools what he found most serviceable All had to be simplified and disengaged from technical subtleties. To attract his Roman pupils Panaetius would naturally choose simple topics susceptible of rhetorical treatment or of application to individual details. He was the representative, not merely of Stoicism, but of Greece and Greek literature, and would feel pride in introducing its greatest masterpieces, amongst all that he studied, he valued most the writings of Plato. He admired the classic style, the exquisite purity of language, the flights of imagination, but he admired above all the philosophy. He marks a reaction of the genuine Hellenic spirit against the austerity of the first Stoirs.

The Later Stoics,-The writings of the later Stoics have come down to us, if not entire, in great part, so that Seneca, Cornutus, Persius, Lucan, Epictetus, Marcus Aurelius are known at first hand. They do not profess to give a scientific exposition of doctrine, and may therefore be dismissed somewhat briefly (see EPICTETUS and MARCUS AURELIUS). We learn much more about the Stoic system from the scanty fragments of the first founders, or even from the epitomes of Diogenes Laërtius and Stobaeus. than from these writers. They testify to the restriction of philosophy to the practical side, and to the increasing tendency, ever since Panaetius, towards a relaxation of the rigorous ethical doctrine and its approximation to the form of religious conviction. This finds most marked expression in the doctrines of submission to Providence and universal philanthropy. Only in this way could they hold their ground, however insecurely, in face of the re-

pointed out The forms of worship were known to be trivial or ligious reaction of the 1st century. In passing to Rome, Stoicism mischievous, the myths unworthy or immoial. But Zeno declared quitted the school for actual life. The fall of the republic was a gam, for it released so much intellectual activity from civic duties. The life and death of Cato fired the imagination of a degenerate age in which he stood out both as a Roman and a Stoic To a long line of illustrious successors, men like Thrasea Paetus and Helvidius Priscus, Cato bequeathed his resolute opposition to the dominant power of the times, unsympathetic, impracticable, but fearless in demeanour, they were a standing reproach to the corruption and tyianny of their age But when at first, under Augustus, the empire restored order, philosophy became bolder and addressed every class in society, public lectures and spiritual direction being the two forms in which it mainly showed activity. Books of direction were written by Sextius in Greek (as afterwards by Seneca in Latin), almost the only Roman who had the ambition to found a sect, though in ethics he mainly followed Stoicism His cor emporary Papirius Fabianus was the popular lecturer of that day, producing a powerful effect by his denunciations of the mamers of the time Under Tiberius, Sotion and Attalus were at ended by crowds of hearers.

Seneca .- Seneca is the most prominent leader in the direction which Roman Stoicism now took. His penetrating intellect had mastered the subtleties of the system of Chrysippus, but they seldom appear in his works, at least without, apology. Incidentally we meet there with the doctrines of Pneuma and of tension, of the corporeal nature of the virtues and the affections, and much more to the same effect. But his attention is claimed for physics chiefly as a means of elevating the mind, and as making known the wisdom of Providence and the moral government of the world. To reconcile the ways of God to man had been the ambition of Chrysippus, as we know from Plutarch's criticisms. He argued plausibly that natural evil was a thing indifferent-that even moral evil was required in the divine economy as a foil to set off good The really difficult problem why the prosperity of the wicked and the calamity of the just were permitted under the divine government he met in various ways, sometimes he alleged the forgetfulness of higher powers; sometimes he fell back upon the necessity of these contrasts and grotesque passages in the comedy of human life Seneca gives the true Stoic answer in his treatise On Providence: the wise man cannot really meet with misfortune; all outward calamity is a divine instrument of training, designed to exercise his powers and teach the world the indifference of external conditions In the soul Seneca recognizes an effluence of the divine spirit, a god in the human frame; in virtue of this he maintains the essential dignity and internal freedom of man in every human being. Yet, in striking contrast to this orthodox tenet is his vivid conception of the weakness and misery of men, the hopelessness of the struggle with evil, whether in society or m the individual Thus he describes the body (which, after Epicurus, he calls the flesh) as a mere husk or fetter or prison of the soul; with its departure begins the soul's true life. Sometimes, too, he writes as if he accepted an irrational as well as a rational part of the soul. In ethics, if there is no novelty of doctrine, there is a surprising change in the mode of its application The ideal sage has receded, philosophy comes as a physician, not to the whole but to the sick We learn that there are various classes of patients in "progress" (προκοπή), i.e., on their way to virtue, making painful efforts towards it. The first stage is the eradication of vicious habits: evil tendencies are to be corrected, and a guard kept, on the corrupt propensities of the reason. Suppose this achieved, we have yet to struggle with single attacks of the passions; irascibility may be cured, but we may succumb to a fit of rage. To achieve this second stage the impulses must be trained in such a way that the fitness of things indifferent may be the guide of conduct. Even then it remains to give the will that property of rigid infallibility without which we are always liable to err, and this must be effected by the training of the judgment. Other peculiarities of the later Stoic ethics are due to the condition of the times. In a time of moral corruption and oppressive rule, as the early empire repeatedly became to the privileged classes of Roman society, a general feeling of insecurity led the student of philosophy to seek in it a refuge against the vicusitudes of fortune which he daily beheld

Musonius—From Seneca we turn, not without satisfaction, to men of sterner mould, such as Musonius Ruffus, who certainly deserves a place beside his more illustrious disciple, Epictetus As a teacher he commanded universal respect, and wherever we catch a glimpse of his activity he appears to advantage His philosophy, however, is yet more concentrated upon practice than Seneca's, and in ethics he is almost at the position of Arlisto. Epictus testifies to the powerful hold he acquired upon his pupils, each of whom felt that Musonius songe to his heart.

Epictetus.-In the life and teaching of Epictetus this thought bore abundant fruit. The beautiful character which rose superior to weakness, poverty and slave's estate is also presented to us in the Discourses of his disciple Airian as a model of religious resignation, of forbearance and love towards our brethren, that is, towards all men, since God is our common father. With him even the "physical basis" of ethics takes the form of a religious dogma—the providence of God and the perfection of the world We learn that he regards the  $\delta a l \mu \omega \nu$  or "guardian angel" as the divine part in each man; sometimes it is more nearly conscience, at other times reason. His ethics, too, have a religious character. He begins with human weakness and man's need of God: whoso would become good must first be convinced that he is evil Submission is enforced by an argument which almost amounts to a retractation of the difference between things natural and things contrary to nature, as understood by Zeno. Would you be cut off from the universe? he asks Go to, grow healthy and rich, But if not, if you are a part of it, then be resigned to your lot.

Aurelius.- Epictetus is marked out amongst Stoics by his renunciation of the world. He is followed by a Stoic emperor, M. Aurelius Antoninus, who, though in the world, was not of it. The Meditations give no systematic exposition of belief, but there are many indications of the religious spirit we have already observed. together with an almost Platonic psychology. Following Epictetus. he speaks of man as a corpse bearing about a soul; at another time he has a threefold division—(1) body, (2) soul, the seat of impulse (πνευματίον), and (3) νοῦs or intelligence, the proper ego. In all he writes there is a vein of sadness, the flux of all things, the vanity of life, are thoughts which perpetually recur, along with resignation to the will of God and forbearance towards others, and the religious longing to be rid of the burden and to depart to God. These peculiarities in M. Antoninus may perhaps be explained in harmony with the older Stoic teaching; but, when taken in connection with the rise of Neoplatonism and the revival of superstition, they are certainly significant. None of the ancient systems fell so rapidly as the Stoa. It had just touched the highest point of practical morality, and in a generation after M. Antoninus there is hardly a professor to be named. Its most valuable lessons to the world were preserved in Christianity; but the grand simplicity of its monism slumbered for fifteen centuries before it was revived by Spinoza.

before it was revived by Spinoza.

STOKE DEWINGTON. a metropolitan brough of London.

STOKE NEWINGTON, a metropolitan borough of London, England, Pop. (1951) 49, 137; area 1.3 sq.mi. In Church street is the restored ancient parish church of St Mary. The borough returns one member to parliament. A new town hall was opened in 1937.

STOKE-ON-TRENT, a city in Staffordshire, England, in the heart of the Potteries. Pop. (1951) 275,095. Area 33.1 sq mi Stoke-upon-Trent, Burslem, Fenton, Hanley, Longton and Tun-

stall were amalgamated on March 31, 1910. In 1928 the borough became a city, with a lord mayor, and in 1920 was further extended. The principal public buildings are the town hall (enlarged 1910-19), the county court offices, the market hall, the Minton memorial building, and the North Staffordshire Technical college (1914, enlarged 1921), containing the Solon bibary ocramics, one of the finest in existence. There are several large pulss, In addition to the potteries, there are coal mines, as well as deposits of coarse clay, but the finer china-clay comes from Cornwall and elsewhere. Other industries are electrical accessories, rubber tire manufacture, dyeing, etc. The district is well served by railways and also by the Grand Trunk (Trent and Mersey) canal. There is a statue to Josiah Wedgwood (b. 1730) in Burslem. Other names made famous by the pottery industry here are Josiah Spode (b. 1754), Herbert Minton (b. 1793) and W. T. Coolead.

In the Domesday Survey of 1086 half the church of Stoke and lands in Stoca are said to have belonged to Robert of Stafford Market rights were not acquired until 1845 By the Reform Bill (1832) Stoke sent two members to parhament, and after 1918 sent three members

It was first incorporated in 1874

STOKE POGES, parish and village in Buckinghamshire, Eng, about z mi N of Slough. Pop. (1921 st) 15,500. Area 4 sq mi It is a residential area. Humbert de Pugeis held the manor in 1255. St. Giles's chunch is of mixed architectural styles, Thomas Gray is burned in the churchyard, held to be the original of his Elegy. William Penn (q v) built the manor house, later a golf cheb.

STOKES, ADRIAN (1887-1927), English bacteriologist, was born at Lausanne, and educated at Trinity college, Dublin, becoming demonstrator in anatomy, and assistant professor of pathology. During the World War, he established a mobile laboratory for the prevention of epidemic outbreaks, including typhoid. His inoculation of the Belgian civil population helped to suppress enteric. He was awarded the Belgian order of the Crown, and in 1918 received the DSO After the war (1919) he became professor at Dublin and in 1922 he was appointed to the Sir William Dunn chair of pathology. In 1920 the Rockefeller Commission on Yellow Fever in West Africa included Stokes among its members, and in 1927 asked him to go out to West Africa. He collaborated with Hideyo Noguchi (q.v) and William Young, and their discovery of a monkey susceptible to the disease enabled them to prepare a preventive vaccine. Stokes became infected with the disease, and died on Sept. 19, 1927. He published papers, particularly on infectious jaundice, typhoid carners and dysentery.

and opsentery.

STOKES, SIR (FREDERICK) WILFRID SCOTT
K.B.E. (1860-1937), engineer and mventor, son of Scott Nasmyth Stokes, was born in 1860 at Liverpool After some years
in ratiway work he joined Rausomes and Rapier of I pswich, becoming managing director and charman He was distinguished
in many branches of engineering. His inventions, for which some
fity patients were granted, included imprements in sluce gates,
making machinery, ordanace and projectiles. He, had a share in
many notable engineering achievements at home and abroad,
including the Manchester ship canal and the irrigation works in
India, Egypt and the Sudan. He was responsible for the design
of the sluice and lock gates, and he was present both at the openmo of the Assum dam 1907 and of the Senard dam 1926.

From 1915 until 1918 Stokes served on Ministry of Munitions inventions committees, and he was also chairman of the East Anglan and other munitions committees. In 1915 he acquired fame by the timely invention of the Stokes trench mortar and ammunition.

At great personal risk, without previous technical knowledge of explosives he perfected the shells of which more than trenspy million rounds were used with deadly effect in the trenches and at Zeebrugge and elsewhere. He also promoted the invention of effect enti-directaft shells. For his public services he was created K B.E. in 1917. Stokes was president of the British Engineers' Association 1916–1918.

Stokes," The Engineer, Feb 11, 1927

STOKES, SIR GEORGE GABRIEL, BARF (1819-1903). British mathematician and physicist, son of the rector of Skreen. Co Sigo, Ireland, was born on Aug 13, 1819 In 1837 he entered Pembroke college, Cambridge, where he became a fellow in 1841 He lost his fellowship when he married in 1857, but twelve years later, under new statutes, he was re-elected In 1902, he was elected Master. As Lucasian professor, secretary and president of the Royal Society, he held three offices, which had only once before been held by one man, Sir Isaac Newton He was member of parliament for the University from 1887 to 1802. was created baronet in 1889 and died on Feb 1, 1903.

Stokes was the oldest of the trio of physicists, Clerk Maxwell and Lord Kelvin being the other two, who especially contributed to the fame of the Cambridge school of mathematical physics in the middle of the 19th century The Royal Society's catalogue of scientific papers gives the titles of over a hundred memoirs by him published down to 1883. The greater part of his work was concerned with waves and the transformations imposed on them during their passage through various media. His first published papers, which appeared in 1842 and 1843, were on the steady motion of incompressible fluids and some cases of fluid motion, these were followed in 1845 by one on the friction of fluids in motion and the equilibrium and motion of elastic solids, and in 1850 by another on the effects of the internal friction of fluids on the motion of pendulums To the theory of sound he made several contributions, including a discussion of the effect of wind on the intensity of sound and an explanation of how the intensity is influenced by the nature of the gas in which the sound is produced These inquiries together put the science of hydrodynamics on a new footing, and provided a key not only to the explanation of many natural phenomena, such as the suspension of clouds in air, and the subsidence of ripples and waves in water, but also to the solution of practical problems, such as the flow of water m rivers and channels, and the skin resistance of ships

His best-known researches are perhaps those on the undulatory theory of light His first papers on the aberration of light appeared in 1845 and 1846, and were followed in 1848 by one on the theory of certain bands seen in the spectrum. In 1849 his paper on the dynamical theory of diffraction showed that the plane of polarization must be perpendicular to the direction of Two years later he discussed the colours of thick plates, and in 1852, in his famous paper on the change of refrangibility of light, he described the phenomenon of fluorescence, as exhibited by fluorspar and uranium glass, materials which he viewed as having the power to convert invisible ultra-violet rays into rays of wave lengths which are visible. A mechanical model, illustrating the dynamical principle of Stokes's explanation was shown in 1883, during a lecture at the Royal Institution, by Lord Kelvin, who said he had heard an account of it from Stokes many years before, and had repeatedly but vainly begged him to publish it. In the same year, 1852, there appeared the paper on the composition and resolution of streams of polarized light from different sources, and in 1853 an investigation of the metallic reflection exhibited by certain non-metallic substances About 1860 he was engaged in an inquiry on the intensity of light reflected from, or transmitted through, a pile of plates; and in 1862 he prepared for the British Association a valuable report on double refraction, which marks a period in the history of the subject in England. A paper on the long spectrum of the electric light bears the same date, and was followed by an inquiry into the absorption spectrum of blood

The discrimination of organic bodies by their optical properties was treated in 1864; and later, in conjunction with the Rev. W. Vernon Harcourt, he investigated the relation between the chemical constitution and the optical properties of various glasses, with reference to the conditions of transparency and the improvement of achromatic telescopes. A still later paper connected with the

construction of optical instruments discussed the theoretical limits to the aperture of microscopical objectives. In other departments of physics may be mentioned his paper on the conduction of heat in crystals (1851) and his inquiries in connection with the radiometer, his explanation of the light border frequently noticed in photographs just outside the outline of a dark body seen against the sky (1883); and, still later, his theory of the Rontgen rays, which he suggested might be transverse waves travelling as innumetable solitary waves, not in regular trains Two long papers published in 1849-one on attractions and Clairaut's theorem, and the other on the variation of gravity at the surface of the earthalso demand notice, as do his mathematical memoirs on the critical values of the sums of periodic series (1847) and on the numerical calculation of a class of definite integrals and infinite series (1850) and his valuable discussion of a differential equation relating to the strains, stresses and other factors involved in the breaking of railway bridges (1849)

Many of his discoveries were only touched upon in lectures An instance is his work in the theory of spectrum analysis Some of Stokes's friends and punils claimed that he had anticipated Kirchhoff but Stokes maintained that he had failed to see an essential step in the argument and disclaimed priority. As Lucasian professor. Stokes announced that he wished to help any member of the university in his mathematical studies, and pupils were glad to consult him, even after they had become colleagues During the thirty years of his secretaryship to the Royal Society he advanced the cause of mathematical and physical science, not only by his own investigations, but by suggesting problems for

inquiry and inciting men to attack them.

He received the Rumford medal in 1852 and in 1893, the Copley medal His numerous other honours included the Prussian Ordie pour le Mérite. In 1869 he presided over the Exeter meeting of the British Association

or George Stokes's mathematical and physical papers were pub-ed in a collected form in five volumes, the first three (Cambridge, Sir George Noxes's mathematical and physical papers were puriabled in a collected form in the volumes, the first three (Cambridge, Indied in the Cambridge, 1998) and 1998 and 1998 under that of Sir Joseph Laumor, who also selected and arranged the Henom and Scientific Correspondence of Stokes published at Cambridge in 1997. Stokes was the author of Light (1884–197) and Natural Theology (1891).

STOKES, WHITLEY (1830-1909), British lawyer and Celtic scholar, was a son of William Stokes (1804-1878), and a grandson of Whitley Stokes (1763-1845), each of whom was regius professor of physic in the university of Dublin Educated at Trinity college, Dublin, young Stokes became a barrister and in 1862 went out to India In 1877 he became legal member of the viceroy's council, and he drafted the codes of civil and criminal procedure. After his return to England in 1882 he devoted himself to the Celtic studies which made him famous. He studied Irish, Breton and Cornish texts, and among his numerous works may be mentioned editions of Three Irish Glossaries (1862): Three Middle-Irish Homsles (1877); and Old Irish Glosses at Wurzburg and Carlsruhe (1887) He was one of the editors of the Irische Texte published at Leipzig (1880-1900); and he edited and translated Lives of Samts from the Book of Lismore (1890) With Professor A. Bezzenberger he wrote Urkeltischer Sprachschatz (1894) His principal legal work was The Anglo-Indian Codes (1887). He died in London, April 13, 1909.

STOKESAY, a fortified manor house in Shtopshire, Eng., 61 mi. N.W. of Ludlow. Stokesay castle is one of the most remarkable moated manor houses surviving in England. It was built in 1240 by John de Verdon with banqueting hall, north tower and solar (panelled in the 17th century). The south tower was added in 1291 when the Ludlows bought Stokesay and fortified it The 16th-century half-timbered gatehouse replaces the old entrance tower From 1620 to 1869 (when it was thoroughly repaired) Stokesay belonged to the lords Craven,

STOLBERG, FRIEDRICH LEOPOLD, GRAF ZU (1750-1819), German poet, the younger son of Count Christian Stolberg, was born at Bramstedt in Holstein on Nov. 7, 1750 He studied in Göttingen and was a member of the famous Göttinger Hum or Dichterbund. After leaving the university he made a journey to Switzerland with his brother Christian, in company with Goethe In 1777 he was appointed envoy of the prince bishop of Lubeck at the court of Copenhagen, but often stayed at Eutin, where he was the intimate associate of J H Voss In 1782 he married Agnes you Witzleben, whom he celebrated in his peams After her early death in 1788, he became Danish envoy at the court of Berlin, and contracted a second marriage with the countes Sophie von Redern in 1780, In 1791 he was appointed president of the Lubeck episcopal court at Eutin, he resigned this office in 1800, and returning to Munster in Westphalia, there jouned, with his whole family, the eldest daughter only excepted, the Roman Catholic Church For this set ple was severely attacked 1810.

After Iving for a while (from 1812) in the neighbourhood of Bildefeld, Stoberg removed to bus estate of Sondermublen near Onabruck, where he ched on Dec 5, 1819. He wrote many odes, ballads, satires and dramas—among the last the tragedy Timoleon (1784), translations of the Hiad (1778), of Plato (1706–1797), Asschylus (1802), and Ossian (1806), he published in 1815, a Leben Alfredd des Grossen, and a voluminous Geschichte der

Religion Jesu Christi (17 vol , 1806-1818).

Stölberg's brother, Christian, Gara zu Stoleerg's hether, Eristian, Gara zu Stoleerg's Hazil, was also apect. Born at Hamburg on Oct 15, 1748, he became a magustrate at Tremsbuttel in Holstem in 1777, and died on Jan 18, 1821. Of the two brothers Frendrich was undeubtedly the more talented, but Christian, though not a poet of high originality, excelled in the utterance of gentle sentiment. They published together a volume of poems, Gedichte (edited by the contract of the co

Christian von Stolberg was the sole author of Gedichte aus dem Griechtschen (1782), a translation of the works of Sophocles (1787), and of a poem in seven ballads, Die wesse Frau (1814), which last attained considerable popularity.

The Collected Works of Christian and Friedrich Leopold zu Stolerg were published in zo vol 1820-25, rade di 827). Friedrich's correspondence with F. H. Jacobi will be tound in Jacobis Breigneschen Steller and Steller Steller and Steller S

STOLBERG, a town of Germany formerly in the Prussian Rhine province and after 1945 in N. Rhine-Westphalia, about 6 mi E of Aachen.

The population of Stolberg in 1039 was 20,498. Its prosperity began in the ryth century, when French refugees introduced brass founding. A castle was built on the site of a church said to have been used by Charlemagne Leading industries developed there include metal-working in zinc, brass and iron.

STOLE, a liturgical vestiment of the Catholic Church, peculiar to the higher orders, i.e., descons, priests and hisbops. It is a strip of material, usually silk, some 2½ vd. long by 4 in wide; in the middle and at the ends, which are commonly broadened out, it is ornamented with a cross. Its colour varies with the liturgical colour of the day, or of the function at which it is worn. The stole is worn immediately over the abl or surplice; by deacons, scartifwise over the let shoulder, across the breast and back to the right side; by peters and bishops, dependent from the neck, the two ends failing over the breast; In the case of bishops the stole always hangs straight down; while priests ware it crossed over the breast when vested in the alb. According to the Roman Catholic usage the stole is worn only while performing religious functions.

The origin of the stole is very obscure. It has been variously derived from the ancient stole, which was, however, a tunic, from the Jewish prayer blanket (tallith), from the ancient oration (neck (olth) and, as regards the diaconal stole, from a napkin used in the litturgy. Father Braun, however, in his Liturgache Gesend-

ung, gives good reasons for rejecting all these derivations and suggests that the stole was originally introduced as that which first appears in the 22nd canon of Laodicea, viz, a special mark of distinction for deacons, which was later extended to higher orders

The stole was not one of the vestments prescribed by the rubures of the first Prayer book of Edward VI (see VESTMENTS) It was replaced in the Church of England from the Reformation onward by the scarf, a broad band of black silk, formerly part of the outdoor dress of the dignified clergy and without hturgical significance. This vestment has some resemblance to the stole, in that its sworn round the neck, hanging straight down in front over each shoulder. This resemblance facilitated the reintroduction of the stole by the "Ritualists" during the 19th century. The revised Prayer book, adopted by convocation and the church assembly in 1027, authorized the use of the "stole or scarf."

STOLEN GOODS: See LARCENY

\$TOLP or Stupsex, a town formerly in Pomerania, Germany, and after 1943 in Kossalin province, Pol Pop (1946) 33,948
Stolp received town rights in 1273 From the 14th to the 16th century it was a member of the Hainseatic league Until 1627, when it passed to Brandenburg, the town usually belonged to the dukes of Pomerania The large church of St Mary, with a 14th century tower, the 16th century Renaissance castle which became a prison, one of the ancient town-gates restored in 1872 and the church of St 16th f 12th century are the 10dest buildings.

church of St. John (13th century) are the oldest buildings STOLYPIN, PETER ARCADIEVICH (1863—1911), Russan statesman, was born at Baden-Baden in 1863. He was educated at St Petersburg (Leningrad), and n 1902 he became governor of Grodno, and in 1903 of Saratov, where he was a firm administrator.

In 1906 Stolypin was minister of internal affairs, and in July succeeded Goremykin as minister-president (See Russia.) His relentless policy led to attempts upon his life. In Aug 1906 a bomb was exploded at his summer residence, injuring a daughter, and on Sept 14, 1911, he was shot in a theatre at Kiev before the eyes of the Imperial family, by a Jew, Mordka Bogrov He died on Seot. 18, 1911

STOMACH, the bagiske digestive organ which in man is in the upper left part of the abdomen lying between the oesophasgus and the duodenum For anatomical details see ALIMENTARY CANAL For the diseases of the stomach in general see ALIMENTARY SYSTEM, DISEASES OF THE, and for special forms, DYSPEPSIA, GASTRIC AND DUODENAL ULGER, GASTRICTS; etc.

STONE, EDWARD JAMES (1831-1897), British astronomer, was born in London on Feb. 28, 1831. He was educated at the City of London school, King's college, London, and Queen's college, Cambridge.

In 1966. Stone succeeded Main as chief assistant at the Royal observations, Greenwich He deduced the solar parallax, first from observations of Mars, obtaming 8 937' (Mon Not R A S, xxxii. 128), and 8.945' (Mem of R A S, vx). xxxiii), and secondly from the transit of Venus in 1769 which yielded 8 91'' (Mon Not R.A.S., xxviii, 25) From the Greenwich transit circle observations between 1851 and 1865 he found for the constant of lunar nutation the value p.134''. He received the Royal Astronomical society's gold medal in 1869, and in 1870 became astronomer at the

He produced a catalogue of 12,441 stars to the 7th magnitude between the south pole and 25°. S. declination, published as the Cope Catalogue for 1880. In 1878, he was appointed Radchife observer at Oxford. At Oxford he extended the Cape observations of stars to the 7th magnitude from 25° S declination to the equator, and collected the results in the Radchife Catalogue for 1899, which contains the places of 6,424 stars. Stone observed the transit of Venus of 1874 at the Cape, and organized similar expeditions in 1882. He was presented to the Royal Astronomical society (1838–1884), and drew attention to the old observations at the Radcliffe observatory by Hornsby, Robertson and Rigado (Mon. Not. R.A.S., vol. iv). He died at Oxford on May 9, 1899.

STONE 437

STONE, GEORGE (1708-1761), archibishop of Armagh, es and a London banker, was educated at Westmaster school d Christ Church, Oxford He took holy orders and advanced only in the church, mainly through the influence of his brother drew (1703-73), who was undersecretary of state (1734) un-re George II and treasurer to Queen Charlotte under George I. When the duke of Dorset became lord leutenant of Ireland 731, George Stone went to Ireland as the chaplaim After Iding various preferments in Ireland as deen and histop, he came archibishop of Armagh in 1747. As archibishop he proved ire a politician than an ecclessastic In 1758 Stone wrote a letter, seeved in the Bedjord Correspondence (it, 387), in which he asks despondently of the distress of the people. He was one of 3 "undertakers" who controlled the Irish house of commons, d took a prominent share in the administration of Ireland until ideath in London on Der 10, 1764.

death in London on Dec 19, 1764.
Although this "much-abused prelate," as Lecky calls him, was firm supporter of the English government in Ireland, he was t intolerant. It was due to him that the antitithe disturbances Ulster in 1765 were suppressed with little bloodshed, he faured conculation toward the Roman Catholics, whose loyalty he lended

STONE, LUCY (1815-1893), US reformer and women's that leader, was born in West Brookfield, Mass, Aug 13, 1818. a child, indignant at the way in which women were treated, she termined to go to college, study Greek and Hebrew and try to demine whether the Scripture tests regarding subjection for men were correctly translated. She enrolled at Oberlin, O, the by college admitting women at that time. She was graduated in 47, and in 1848 was engaged as lecturer for the Anti-Slavery liety

It was agreed that she should lecture for the Anti-Slavery society Saturday evenings and Sundays—times regarded as too sacred a women's rights meeting. The rest of the week she might ask for women's rights on her own responsibility. In time she n wide popularity. She headed the call for the first National name's Rights convention, held at Worcester, Mass, in 1850—all signed by many distinguished men and women. A report of so convention reached England and attracted the attention of urriet. Taylor, afterward the wife of John Stuart Mill. Mrs. ylor worde an article about it for the Westmuster Reviews, which is the beginning of the modern movement for women's rights in eland.

In 1853 Miss Stone married Henry B Blackwell (1824-1900), antislavery worker. They issued a joint protest against the in-audities in the marriage laws, and with full approval she kept cown name. In Boston, in 1870, she founded the Woman's urval From 1872 until 1839, she served on its cidical staff led by her husband and later by her daughter. She died Oct. 18,

STONE, MELVILLE ELIJAH (1848-1929) U.S. jourlist, was born in Hudson, III, Aug. 22, 1848. In 1866 his father s made pastor of a Methodist church in Chicago, and it was ret that he got his schooling. In 1864 he began as a reporter the Chicago Tribine, but he became proprietor in 1869 of an in foundry and machine shop. In the great Chicago fire of 71 this was destroyed, and Stone then engaged in the administive work of municipal rehef and reconstruction. In 1872 he name one of the editors of the Chicago Republican (subsequently 18-r-Ocean), and later of the Post and Mail, becoming for several yra a political correspondent at Washington, D.

At the end of 1875, having returned to Chicago, Stone with a league, started the evening Dayl News, and two years later itor F. Lawson became a partner. The venture was very prosous He and Lawson bought out the Post and Mail, and in 37 they established the Morning News (later Record and cord-Herald). In 1888 he retired, and later founded the Globe tional bank, of which he became president in 1892. In 1893 became general manager of the Associated Press, which reved a new stimulus. He held this position until April 1921, tring that 28 years the budget of the Associated Press had wan from \$50,000 to \$6,000,000,000 and it had come to furnish wan from \$50,000 to \$6,000,000,000 and it had come to furnish

more than half the news printed in U.S. papers. He died in New York city on Feb. 15, 1929

See his autobiography, Fifty Years a Journalist (1921)

STONE, NICHOLAS (1587-1647). English sculptor and architect, was the son of a quarryman of Woodbury, near Exeter, and as a boy was apprenticed to Isaac James, a London mason About 1603 he went to Holland and worked under the sculptor Hendrick de Keyser (1552-161) and his son Pieter, and married his master's daughter. Stone is said to have made the portico to the Westerkerk at Amsterdam Returning to London about 1613 with Bernard Janssens (F 1610-20), a Fellow pupil, he settled in Southwark and obtained a large practice, in 1610 he supponted master than 101 he set 1610 he sone of the size 
See an article by A E Bullock in the Architectural Review (1907), and the same author's illustrated monograph, Some Sculptural Works of Nicholas Stone (London, 1908)

STONE, market town and urban district of Staffrordshire, Eng., on the Treat raver, 7 ml. N. of Stafford and 9 ml. S of Stoken. Treat Pop (1951), 8,299. Area 2 5 sqm. It is in the Stafford and Stone parliamentary division Shoemaking and brewing are the chief industries. There are earthworks at Bury Bank and Saxon Low, and remans of a 7th-century abboy. In St. Michael's (1750) churchyard is the tomb of Admiral St. Vincent.

STONE, a detached piece or fragment of rock. The word is thus applied to the small fragments scattered in the ground or on roads, to the waterwom pebbles of the seashore or river beds and to rock used as building material. A descriptive word generally accompanies "stone" when referring to pieces of rock cut to a particular size and shape for a specific purpose, e g., millstone, hearthstone, gravestone, etc. The term precious stone is applied to those minerals which, because of their beauty, colour, etc., their rarity and usually their hardness, are valued for ornaments (see GEM). The word is applied to many objects resembling a stone or pebble -the hard pit of certain fruits, as peach stone or the calculi or concretions sometimes formed in the gall or urinary bladder or the kidneys. (See Bladder and Prostate Diseases; Kidney, Diseases of). The stone has been a common measure of weight in northwestern Europe. In Germany the Stein was of 20 to 22 lb. In the British system of weights the legal stone or horseman's weight is of 14 lb avoirdupois; in weighing wool it was also of 14 lb., but is now usually 16 lb. The customary stone for fish or butcher's meat is of eight pounds

Building stone is a term somewhat loosely used to describe stone which is sawed, cut or broken, but ordinarily not crushed, in preparation for use in various types of structures. The term is roughly synonymous with dimension stone, which includes also curbing, flagging, paving stones and monumental stone.

Various terms without very exact defautions are applied to building stone. Stone which is shaped for use inhis blocks or slabs of specified dimensions is often referred to as cut stone. This includes stone used primarily as a structual material as well as that used for decoration and having an exterior surface finished by polishing, planing, honing or other means. Some of it is carved. The term shalts is applied to blocks of stone, usually of relatively small size, rectangular in shape but of various dimensions and commonly prepared by swaing, planing or hand splitting and trimming. Rough building stone and rubble are ordinarily irregular pieces of stone of various shapes and size.

Among other terms in use for stone for specific purposes are: eneering stone for relatively thun, usually natural stone slabs that are set on edge as a veneer for the exterior of structures; fingstone or flagging for flat slabs of stone used for walks, for paving courtyards and the like; curbstone for slabs used for curbing; pavings stone for rectangular blocks of stone used for streets, highways or other traffic areas, and for cobblestones which are rounded stones used for the same purposes; and boulders, field stone and creek stone for stone picked up loose from fields, creeks or other sources.

#### VARIETIES OF BUILDING STONE

Many kinds and varieties of stone, ranging in geological age from very old to recent, have been used for building Genetically they may be divided into three groups (1) sedimentary rocks, as limestone, dolomite, sandstone and some marble; (2) igneous rocks as granite, syenite and traprock, and (3) metamorphic rocks as marble, most slate and quartzite

Limestones (sedimentary) are composed principally of calcium carbonate as crystalline particles of the mineral calcite, with varying amounts of impurities such as sand and clay The textures of limestones vary greatly. Some are very fine grained and uniform in colour, others are coarser grained, mottled or streaked and some are granular and consist of fossils or pieces of fossils cemented together Oolite, a variety of limestone composed of cemented small rounded grains, many of which have a concentric structure, has been considerably used as a building stone, especially that from the Bedford, Ind, district in the United States, the Portland and Bath oolites of England and the Caen oolite of France. Many limestones occur in deposits comprised of relatively thin strata, a character which favours their use as sources of rough building stone, rubble, veneering stone and the like Thicker bedded deposits are usually favoured for the production of cut stone Coquina, a variety of recently formed limestone composed of loosely cemented shells and shell fragments, is used as a building stone in Florida, Cuba, the West Indies and elsewhere

Dolomites (sedimentary) consist principally of the mineral dolomite, a double carbonate of calcium and magnesium, and have many of the same characters as limestones, from which they are sometimes not differentiated. They have the same crystalline nature, occur in thin to massive bedded deposits and contain fossils Some dolomites are gray when freshly quarried but weather in time to a yellow or buff colour-in some cases a desuable phenomenon -as a result of the change of small amounts of ferrous carbonate in the fresh stone to ferric hydroxide. Magnesian limestone or dolomitic limestone has a chemical composition intermediate between that of limestone and dolomite

Travertine (sedimentary) is a variety of limestone deposited by waters of springs and when sufficiently hard it is locally used as a building or decorative stone. That quarried near Rome and sometimes referred to as Italian or Roman travertine has been used for many years because of its pleasing variegated gray and white or buff colour and texture of irregularly shaped pores distributed through the groundmass of the stone. Recently the buff travertine has been considerably used for interior decoration. In some places porous buff dolomite, used as building stone and resembling the Italian travertine, is referred to commercially as travertine.

Marble (metamorphic) is, geologically speaking, a limestone or dolomite which has been recrystallized by heat, pressure and solution that accompanied earth disturbances. In this process some of the structural and textural features of the original limestone are eliminated and others substituted, especially those relating to the deformation of the beds by earth forces, and often new minerals are formed. Many commercial marbles are of this sort. but limestones and dolomites are also called marble commercially if they take a good polish, have an attractive appearance and are used for decoration, trim, flooring and the like

Onyx marble (sedimentary), sometimes called cave onyx or oriental marble, is also calcum carbonate, usually deposited in caves and often exhibiting colour banding caused by the presence of metallic

and other exhibiting colour banding cajased by the presence of metanic compounds or other impurities in the various layers of the stone, Mexican only is a well-known example of colour-banded only that has been particularly used for staturary and novellers in colour but often handler group of marbles, dominantly green in colour but often handler group of marbles, dominantly green in colour but often handler group of marbles, dominantly green in colour but often handler group of marbles, dominantly green in colour but often handler group of marbles are repeated and the colour but of the state of th

are composed mostly of serpentine, a hydrous magnesium silicate There are a great many sources and varieties of marble which have been used commercially, among them Italian Carrara and Greek Parian and Pentelic mariles, much used for situary as well as building stone; Italian Seina and Bretic mariles, much used for situary as well as building stone; Italian Seina and Bottidino, Greek Skyros, French Hauteville and Circite, English Purbeck and Devonshire, Swiss Cippolino, Belgian black and Numidian marile of northern Africa In the United States, Vermont, Georgia, Tennessee, Missouri and Alabama, among others, are important producers of marble and furnish stone in a variety of colours and textures. Egypt and northern Algeria in addition to Mexico are well known as sources of onyx marble, as are Ireland, Italy, Greece

and the United States for serpentine marble
Sandstone (sedimentary) is a compacted sand more or less indurated as a result of cementation by silica, calcium (arbonate, clay or iron oxide Generally the giains of sandstone are principally the mineral quartz, SiO<sub>2</sub> Sandstones are commonly shades of white, gray, yellow, brown or red, the last three colours usually being due to oxides of non They are widely used as building stone for rough construction, as rough architectural stone, rubble, curbing and flagging and in the sawed or dressed form both for construction and decoration England, Scotland, Germany and Australia have produced a variety of sandstones for building, in the United States, Ohio, Pennsylvania, Tennessee and New York are the principal producing states

Quartzite (metamorphic or sedimentary) is a sandstone which has been altered into a hard compact tock composed mainly of the mineral quartz. It is used in some places as a building stone, for example, the Stoux Falls quartzite of South Dakota, also known as Sioux Falls granite or jasper, and the Crab Orchard quartzite of Ten-

Slates (metamorphic), as the term is used commercially, are rocks, mostly very fine grained, with more or less well-developed cleavage and other characteristics suiting them for use as relatively thin slabs for building and other purposes. Most slates are the result of the alteration of the sedimentary rocks, clay or shale, particularly by pressures that have accompanied deformation within the earth, so that some of the original minerals are flattened or elongated and others, especially the clay minerals, are changed to flaky or fibrous micaceous minerals, thus producing a rock which, because its mineral components are parallel, cleaves along the flat surfaces of the mineral grains and independently of the original bedding of the rock Such slates sometimes are called mica slates in distinction to clay slates, which are partly metamorphosed clays or shales or clays hardened by cementing materials, and ash and dike slates of igneous origin

The most common colours of slate are gray, black, red, green, purple and brown or mottled combinations of these colours Among minerals and hower or metiled combinations of these colours. The green purposes and hower or metiled combinations of these colours are nematite for responsible for these colours are hemanite for red, hemmitte and chlorite for purples, chlorite and sencite for greens, sencite for gaves and calon for grays and black. When exposed to waster some lates and calon for grays and black. When exposed to waster some lates mineral components of the slate, especially minerals that contain ron, the phenomenon does not necessarily undicate failure of the slate.

ate finds its principal use as a building stone as 100fing but is also used as Hagging, flooring and for various lesser interior construction purposes. In the United States, Pennsylvania, Vermont, Maine, New York and Virginia are important producers of slate for building; it is also quarried near Quebec, Que, and in many other countries of the also quarized near Quebec, Que, and in many other countries of the world, especially in Europe, with well-known sources in England, France, Italy and, particularly, Wales

Granite (igneous) is the term applied commercially to a number of crystalline building stones which have resulted from the solidification of molten tocks (thus called igneous tocks) although the term strictly applies to mostly coarse-grained igneous rocks consisting principally of the minerals quartz, feldspar and hornblende or mice or both Many of the commercial granites are of the latter type Gianites find par-ticular use as monumental stone because of their durability, but they are also used as building stone and sometimes for paying and curbing They usually occur in massive deposits which are not bedded, as are limestone and sandstone deposits, although granites do split in cerinnestone and sangasone deposits and gram) more readily than in others and some deposits show a sheety structure. Granites are of tain directions (referred to as rift and gram) more readily than in others and some deposits show a sheety structure. Granties are of many different predominant colours and shades including white, gray, punk, red, blue, brown and green, they range from fine to coarse shades to the coarse of the the larger producers. I nere are many widerly known granites. Among them are those from the vicinity of Barre, Vt, Quincy, Mass, Stone Mountain, Ga, Wausau and Montello, Wis, St. Cloud, Minn, Mount Airy, N.C., Stanstead, Que, the Scotch granites from Aberdeen and Peterhead, Scot., the Norwegian peal gray, the Swedish rose, the Finnish rapakity, the Egyptian Syene and the English Cornwall and on granites

Other Types.—Besides the above mentioned varieties of building stone, a considerable number of others find more limited use, including basalt and related traprocks (incous) for construction and in the monumental field where they are known as black granites, soapstone (metamorphic), a talcose rock used as tile, wainscoting and the like, greenstone (igneous), a greenst stone related to scapstone employed for structural and decorative purposes, volcanic tuffs (igneous), atgilite (metamorphic) and coral (sedimentary), used principally for constructure) (metamorphic), a talcose rock used as tile, wainscoting and the like

## PROPERTIES OF BUILDING STONE

The desirable properties in building stone, aside from those related to workability, as well as the tests made to measure these properties, differ according to whether the stone is to be used in the intensor or exterior of structures. In the first case, desirable properties include attractive colour and texture, reasonable strength and resistance to

abrasion and cleaning solutions of other liquids with which the stone may come into frequent contact However, if building stone is to give satisfactory service when it is used on the exterior of structures and is thus exposed to the weather, it must possess not only an attractive appearance, adequate strength and in some cases resistance to abiasion, but also resistance to freezing water, to the stresses set up by heating but are restrained to Irelating water, to the stresses set up by heating and cooling, to the action of chemical compounds naturally present or introduced into the atmosphere (especially cubonic and sulphuric acids) and in some instances to the effects of growing plants, as algae, and to salt-water spray or sand- and guit-laden winds. Changes in the immedia Comprising a building stone also may cause deterioration, for example, hydiation of clay minerals or ordization of iron pyrite.

These various potentially destructive agencies are not of equal importance in different parts of the world, and for this reason some building stones that prove sound in waim diy chmates may prove unsound in cold moist climates

The soundness or durability of exterior stones, especially those occurring in bedded deposits such as sandstone and limestone, is often much influenced by the relation of the stone's natural bedding or statisfication to the way it is set in a wall. Thus, stone set with a bedding surface exposed is likely to be less ieusiant to weathering than is a stone with its bedding surface flat in a wall. Other causes of failure of building stone are construction practices which permit water to seep into the stone from roofs or gutters or cause concentra-

tion of drin water

Without doubt the best test of the durability of a stone either for exterior or interior use is its actual performance under various condi-tions. Lacking such information, an examination of weathered outcrops sometimes gives light on durability However, in order to forecast the sometimes gives light on dutability. However, in order to forecast the probable behaviour of stone, certain laboratory tests were devised. Usually consideration of data from a group of tests, rather than from one test alone, as required to evaluate the probable performance of a stone for a specific purpose. Soundness tests include actual repeated freezing and thawing of water-socked pieces to detenime resistance to the spalling and splitting effects of matural freezing and thawing Accelerated soundness tests, havoling use of solutions of vanious sails of the splitting of the splitting of vanious sails. (especially sodium sulphate), attempt to duplicate and augment the stresses produced by the free/ing of water, so that the effects of such stresses are more quickly determinable. Water absorption is also measured in view of the possibility that rocks with a high absorption may be more affected by freezing, thawing and other degenerative processes than are those that absorb little water. This observation cannot be made as a generalization with respect to freezing, however, because other factors are also involved, such as whether or not the poies in a stone are more or less connected and serve as a system which absorbs and cushions the stresses of freezing water, so that some highly porous stones have greater soundness than other stones of less

porosity. Abrupt changes in temperature cause differential expansion and con-traction of the exterior portions of building stones Also, the minerals comprising building stones do not all expand and contract equally. comprising funding stones of not an expand and contact equally.

As a result spalling or other types of failure may occur; or the mortar used with the stone may be adversely affected. Resistance of stone to such stresses may be more or less anticipated by laboratory measure-

ments of thermal expansion

The strength of building stone was formerly of great significance because the walls, partitions and foundations of many structures carried the weight of the entire structure. In most large modern buildings, ine weignt of the entire structure. In most large modern buildings, however, a structural sted framework carries the structural load Nevertheless, in some instances crushing strength tenains a matter of concern, as in the case of bridge pilers and monuments, thus, strength tests are still commonly made. D. W. Kessler and W. H. Sigh give the following ranges in compressive strength, evpressed in Djunda per pounds per compressive strength, evpressed in pounds per compressive strength. ne tonowing ranges in compressive strength, expressed in Doulday Ber square inch, for some of the more common structural stones grantic, square inch, for some of the more common structural stones, grantic, stones, (2000–10,000 Most building stones which are otherwise sound probably have adequate strength to withstand pressures in the more common types of structures. Resistance to abrasion, sire, atmosphesic ands and to the solvent action of water, toughanse, elasticity, density and weight per cubic foot are other properties determined by testing.

The preservation of deteriorating building stones is a matter of incern in old structures that have utilitarian or historical value. Usually it is possible to treat only the outer portion of the stone. methods employed attempt to seal the pores partly or entirely, or to seal the pores and bond together the grains of the surficial portion with a weather-resistant material. Various oils, waxes, fats, insoluble sosps, stheates, silicofluorides, silicones and other materials have been used

for these numbers.

STONE AGE: see Archaeology.

STONE CARVING. Many as are the kinds, there is a character that properly belongs to all good stone carving, whether in relief (high relief or low) or in the round. The first constituent of this character is the quality called plasticity; it is the quality of solidity, of being in three dimensions. The beauty of stone carving is dependent upon this quality. Modelling in clay is a business wherein one staits from nothing, or perhaps a wire only (the armature) and builds up a thing in three dimensions stone carving one does not start from nothing and build up, one starts from a solid thing and proceeds by subtraction instead of addition and, apart from the sensuous enjoyment which some people have in using tools and materials, the natural tendency in stone carving is to subtract as little as possible, as in modelling it is to add as little as possible. The result is that whereas a certain spareness and tensity of form is characteristic of modelling. the character most noticeable in stone carving is fullness and roundness of form-solidity, mass, weight Moreover, by the use of wire or iron armatures it is possible to give a clay model any required freedom and detachment of parts-if it be an image of a man, the arms and legs may stand out freely from the body, fingers may be separate and hair may even stand on end. In stone, on the other hand, freedom or detachment of parts is unnatural and difficult. The custom of many sculptors, ancient and modern, to work exclusively in clay and to leave the business of carving to hired mechanicians is responsible for the lack of the proper character of stone carving in their works Trained mechances are clever enough to do anything; whether the thing done be worth doing is not their affair.

In a stone carving done according to the natural character of stone, there is no detachment of paris; everything is solidly joined to every-thing else. If there be any separation between one thing and another the space between is in the nature of a hole—a piering—as in the characteristic Byzantine foliage carving or in mediaeval window tracery Stone is a brittle and very heavy material, it will stand enormous crushing strains but will hardly bend These differing characters of materials render them suitable for different services—in on or wood for a girder subjected to a bending stiam, stone for a pier or pillar, bronze for a gate, stone for a gatepost And as each material renders its characteristic service, so each has its characteristic beauty To imitate the characteristic beauty of flesh and blood in a material so different as stone is absurd in proportion to the success with which it is achieved, and it is as wasteful as it is ridiculous. The stickbeetle has excellent and it is as wasteful as it is indiculous. The stuckbeetle has excellent reasons for wishing to remain anonymous, that a stone carrow should deare to produce flusions is folly. Moreover, it cannot be done, and the dust and duit which collect in the rome sand dimples of a realistic sculpture very soon belay it. The militation of one material in an-other is wasteful because it is throwing away the special beauty of the

material used. There is great beauty in the sculpture of Michelangelo, but it is not the beauty of stone. The movement of the human mind which is called the Renaissance ushered in an entirely new attitude on the part of artists. Men who had formerly been part of the ordinary gang of builders, who made buildings or sculptures in stone or bronze as one makes boots or books in leather or claim, now caused to be makers and thecame critics. Thus caused to be, as they formerly were, men imitating nature by working as she works (Ars minteur naturem in sua operatione, St. Thomas Aquina, Surmar Theol. 1, 6, 117, a, 1), they became men ministing and the control of th in leather or skins, now ceased to be makers and became critics product of unconscious natural causes whereas the stone carving was the product of a conscious and deliberating mind Neither in the one case nor the other was there any more criticism or imitation of nature than is displayed in an electrical switchboard. It is only in the paucity of language that a sculptor would speak of carving a man or a flower The likeness to nature is an accident of such works, not the substance A crucifix of the 12th century, for instance, or a Buddha of the same

date in India is not substantively a lifelike imitation of a man as seen in flesh and blood The substance of such things is their philosophical or religious significance. That being so, the artist was free to use or exploit the aesthetic possibilities of the material used to the fullest extent Thus it is that for the study of stone carvings as works of art we are compelled to look to the past or to foreign and distant countries compelled to look to the past or to loreign and custant countries. There is no question whether modern European stone or marble carvings are good or bad things. The statue of Gladstone in Westmister abbey is probably an excellent portrait, it would simply be wrong to judge it as stone curving. On the other hand, the sculpriess of Egypt, India and China, like those of early mediaveal Europe, are primarily stone curvings, it would be wrong to judge them as portraits or as militations of nature. After about 1350 the desire for versimilitated became the ruling motive

Generally, a good stone carving is one which will not break (Michelangelo is said to have enunciated, but perhaps not followed, the dictum that the test of a good sculpture was to roll it down hill without breaking it); that stands firmly and well balanced; that is free from of Maurice Dens, "What we ask of stone carring is that it shall look

of Maurice Denis, "What we ass to assert the first the stone the stone the stone the stone the stone of the s

STONECHAT, a small thrush, Saxicola torquata, ranging over Europe, Asia and Africa The male is black, white and rufous in colour. It is an active, restless bird, of open brushlands where it sits on tops of bushes flicking its wings and tail, and flying down to the ground to pick up its insect food. Other related species are the wheatear and the whinchat (qq.v) (A. L. RD.)

STONE FLY, a member of the insect order Plecoptera (q.v.), a group of wide distribution and containing about 800 The immature stages are aquatic, confined chiefly to species. cfreeme

STONEHAM, a town of Middlesex county, Massachusetts, U.S.A. Pop. (1950) 13,229. Within its area of 6.6 sq mi, is Spot pond, a large lake which serves as a storage basin for the metropolitan water district; and 730 ac. of the Middlesex Fells reservation.

The manufactures include shoes, shoe stock, furniture, chemicals and druggists' supplies Steam power was first applied to the manufacture of shoes there, by John Hill and company who introduced many laboursaving devices, notably the heeling machine (1862). Stoneham was settled about 1668. It was incorporated as a town in 1725.

STONEHAVEN, small burgh, seaport and county town (since 1607) of Kincardineshire, Scotland, 15 mi. S.S W. of Aberdeen by road

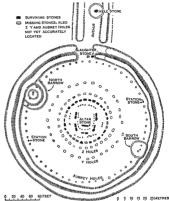

The population in 1951 was 4,438. There the rivers Cowie and Carron enter the sea. The old town with a 17th-century tolbooth hes behind the harbour, used mainly by fishing boats; northward is the newer quarter with the beach and an open-air swimming pool. Fishing nets are made at Stonehaven. Dunnottar castle, built by Sir William Keith (see KEITH) in the 14th century, is 11 mi. contheast

STONEHENGE, a circular setting of large standing stones surrounded by an earthwork, situated about 8 mi. N of Salisbury. Wiltshire, England. Among the earliest references to it is that of Geoffrey of Monmouth, who relates in his Historia Regum Britanmae (c. 1136) the legend that the stones were magically transported from Ireland by Merlin. This legend perhaps enshrines a folk memory of the bringing from Pembrokeshire of the "bluestones" which form part of the monument. The supposed connection of Stonehenge with the Druids, which, though without foundation, has held the public imagination since the 17th century, originated with John Aubrey (1626-97), and was more particularly elaborated by William Stukeley in 1740. The modern interpretation of the monument is based chiefly on excavations carried out by the Society of Antiquaries of London since 1919.

The monument consists of a number of structural elements, mostly circular in plan. On the outside is a circular ditch, broken by an entrance gap on the northeast, with a bank immediately

Inside the bank is a ring of 56 pits, known after their discoverer as the Aubrey holes Between these and the stones in the centre are two further rings of pits, now invisible on the surface, known as the Z and Y holes The stone setting consisted of two circles and two horseshoes of uprights, the first and third being capped by stone lintels. Additional stones include the Altar stone, lying on the axis southwest of the centre; the Slaughter stone inside the entrance of the earthwork; two Station stones just within the bank on the northwest and southeast, and the Heel stone, standing on the Avenue outside the entrance and surrounded by a narrow circular ditch

Similar ditches enclose two flat areas on the inner edge of the

bank, known as the North and South barrows, with empty stoneholes at their centres.

These structures can be divided into four groups, each representing a separate phase of building. To the first belong the bank, ditch and Aubrey holes, and the Hele (Heel) stone with its ditch.

This earliest monument is thought to have incorporated at least one block of rhyolite, one of the varieties of bluestone imported from southern Wales which figure prominently in a later stage of the history of Stonehenge.

The ditch is very irregular in outline and was dug in a series of interconnected pits; it averages 13 ft, in width, 5 ft, in depth, and 350 ft. in diameter. The sides are steep and the bottom flat bank stands on its inner edge, and is of only moderate height. It is made of chalk rubble, laid directly on the underlying chalk rock after removal of the ancient turf.

The Aubrey holes form a circle about 290 ft. in diameter and are spaced 16 ft. apart. They are circular holes varying in diameter from 30 in. to 70 in and in depth from 24 in. to 48 in, and were deliberately filled with burned chalk and chalk rubble, soil and ashes; many of them show signs of subsequent disturbance in early times. Although two-thirds of those excavated contained cremated human bones, their purpose is not necessarily sepulchral, nor is there any evidence that they ever held uprights of stone or wood. With them should be associated a number of other cre-

mated burnals in the bank and the silting of the ditch

These structures together form an open-air sanctuary of the kind known as a Henge monument, belonging to the late Nothing period. This date is confirmed at Stonehenge not only by pottery and by objects associated with the cremations, but also by a node-active carbon determination made on charcoal from the Aubrey holes (1848 B SC  $\pm$  215 years).

To the second phase belong the outer ring and horseshee of uprophic, the Station stones and harrows, and the Shaphter stone. The stones are all sarsens, a form of sandstone whose nearest probale source is the surface of the downs near Avelvry, about 5 mil to the notitivest. The centre of these structures differs slightly from the earlier centre, and less at the intersection of lines drawn between the Station stones and between the centres of the harrows, which thus appear to represent perlumnary markers exceed to find the centre of the earthwork. The barrows are known to be later than the hank and the Aubret who

The outer sarsen ring consisted originally of 30 uprights, set on a circle 98 ft in diameter, supporting a continuous ring of 30 lintels. The average length of these uprights is 18 ft, of which about 4 ft. is below ground

In the outer horseshoe the five sarsen trillihous (each of two uprights capped by a lintel) increase in height from 16. It at the outside to 22 ft at the centre. The upraghts were erected by means of ramps entering their sockets from the inade, and must have been raised before those of the outer ring. Both upraghts and hintels, here and in the outer ring, have been carefully dressed to shape by pounding with stone mauls, many of which were used as packing-stones round their bases.

The lintels are fixed to the uprights by mortice-and-tenon joints, and those of the outer ring are also fixed to each other by toggle or tongue-and-groove joints. This technique is copied from a wooden prototype, probably not directly but through the intermediary of an earlier local monument built of bluestone as suggested below.

The sarsen structure exhibits a number of architectural refinements Great care was taken with the alignment of the stones and the levelling of the lintels

The inner and outer faces of the intels are worked to the appropriate curve, and on the trilliuons their upper faces are broader than the lower, so that when viewed from below their sides do not appear to recede. Such refinements are unknown elsewhere in prehistoric northern Europe, and imply influence from the contemporary Mycenaean and Munoan architecture of the Mediterranean. The probability of such influence was startlingly confirmed in 1933 by the discovery of carripas of Bronze Age weapons on three of the saren stones. These comprise over 30 representations of bronze ascheades, of a pattern current in Britain (and of Irish manufacture) between 160 and 1400 a C., and a single carring of a higher discovery of the content of the

The order and absolute date of the two remaining phases, represented by the Z and Y holes and by the bluestones, is not known, though both are certainly later than the sarsen stones. The Z and Y holes average 4 ft. by 6 ft. in diameter and 40 in in depth, and though roughly concentric with the sarsens are irregularly slinned.

After the original excavation of these holes they appear to have sited up naturally over a period of many conturns, during which pottery of the pre-Roman Iron Age found its way into their filling. There is, however, no reason for supposing that the hotes are of this dist, or for associating them with the Druids. Though their date and purpose is unknown, it is perhaps significant that they are of a suitable size and shape to serve as emplacements for the bluestones, and that their number is the same as the best estimate of the original number of the bluestones in their present setting. It may be, therefore, that the Z and Y holes represent an unfinished project for the erection of the bluestones at Stonebenge, which for some reason unknown was abandoned in favour of the present setting of these stones.

The bluestone setting, consisting of the inner circle and horse-

shoe and the Altar stone, is made up of at least four varieties of igneous rock foreign to the region. The inner horseshoe is of spotted dolenie, and the inner circle manily of the same rock with four specimens each of rhydite and volcanic ash, the Altar stone alone is of micaceous sandstone. The first three of these rocks are found in association only in the Prescelly mountains in Permbrokeshite, whence they were brought to Wittshire.

The occurrence of micaceous sandstone near Milford Haven suggests transport of the stones at least in part by seagoing boats

The bluestones are all carefully diessed to shape, and taper gradually from the ground to fist tops. They vary in high from 6 fit to 8 ft. It is clear that they were erected after the sarsons, since some of them stand in the filling of the ramps of the sarsons' sockets. Three of them, all of dolente, retain the remains of a tenon and two pairs of mortices respectively. This suggests that they, and probably the remainder of the dolerate, originally stood elsewhere as a separate monument incorporating at least two trilithous, and it is doubtless from this that the mortice-and-tenon joints of the sarsens stones were derived.

Recent work suggests that another structure, of bluestones other than dolerate, stood about a mile northwest of Stonehenge, and that the bluestones were brought to Wiltshire in the late Neolithuc period, some centuries before their erection in their present position at Stonehenge

Stonehenge is approached from the northeast by an avenue, 7g ft. in width, bounded by a slight bank and ditch on each side, which runs by three successive alignments to the bank of the River Avon 14 m to the southeast. In date at appears to be intermediate between the first and second phases. The section adjoining Stonehenge, and the aws of symmetry of Stonehenge itself, is aligned approximately on the point of midsummer sunits (though not, as is often stated, on the file is stone). This fact has occasioned much fruttless conjecture

STONE MONUMENTS, PRIMITIVE. The term primitive stone monuments implies an ancent or rudimentary memorial or mark. Some represent men or things. Others are tabernacles, provided, either with pious or magical intent, that a power or a soul may be induced to dwell therein.

At first, they were memorial—to keep in memory the site of a certain event, or definite spot—perhaps to mark a route, perhaps to delimit the bourn of forbidden ground. They would be signosts, of a welcoming, funereal or warming character. Not ural existing marks were doubtless first used; later, wooden posts where trees were plentiful.

Stone heaps or boulders where available, would replace wood aless subject to decay and more difficult to remove treacherously. Such marks become sacred by natural evolution, so that men fear to remove them. This process varies according to the people's standard of magic or religion.

Retribution is to be feared should a memorial be defaced or a boundary stone moved. During Woolley's excavation at Ur in 1944 there was found, in what appeared to be a museum or records department attached to a convent of the Kassite period (£. 1600 a C.), such a boum (now in the Baghdad museum), photographs of which were exhibited in 1945 in the basement of the Assyrian department at the British Museum. On this stone were graven the boundaries of the property it had presumably once marked, the names of the owner and of the witnesses to the gods whose emblems were carved upon the stone should this testinonly to destroyed. The stage from the bourn to the ideal a witness-stone is almost imperceptible. The stone becomes something on which solemm ouths can be sworn, as is exemplified by pillar-stones and their folk-dore, especially such as have a hole through which may be passed the clasped hands of two persons making a contract. The Law Fail at Tan and other stones on which irish kings and chiefs took their oaths at their imaguration, and the Bocac della Versta in Rome, display the persistence of such an idea into historic times. Similar traditions have clung for longer periods to witness-stones or pierse the justice among the primitive stone monuments of Brittany, Cornwall, Wales, Scotland and Teland, dating from about 400 E.C. to An 300.

Once a memorial pillar or a witnessestone became finvested with such a sacral character it would easily uself become the object of propitatory rites, especially if marked with sacred emblems. Thus the drivers travelling the lonely desort routes uniting India, China, Tibet, Russia and Persia pour hibations of wheel oil on the anthropomorphic stone wasyide caims and sacred wooden pillars set up at certain stages of their road. (See also Genesis xwixii, 16-22)

As to the representation of the human form or of its lifegiving organs, the more primitive idea is not the symbology associated with fertility cults, but the intention to represent a particular man or a supernatural being in the likeness of man however crude. This is demonstrable, because although standingstones or menhirs rudely hewn into effigies, recognizably female by their indications of femininity (and almost certainly intended to represent or symbolize a Mother Goddess), are compatible with a very primitive knowledge of physiology, and call for no esoteric or philosophical explanation, the case with phallic (see PHALLICISM) representations is rather different. A religion calling for the recognition of that symbol as representative of fertility (as distinct from fecundity) presupposes a society cognizant of the respective parts played by the male and female functions in nature in the production of offspring, and long familiar with husbandry and cattle-raising, whereas in very primitive societies the physical association of the sexes, though regulated by custom, is often unrelated to paternity. The child is known to be physiologically produced by its mother. Socially it may belong to its maternal uncle (see Avunculate), uterine relationship between brothers and sisters being easily demonstrable. Even when the observed association of maternal fecundity with post-initiate sexual connection brings about recognition of cause and effect in specific cases, there is still some way to go intellectually before the symbol of male fertility can take the natural place in the ideology of magic or religion that is taken by the crude representa-tion of a human form with female breasts. The stone pillar that is recognizably a phallus is not on the same primitive plane with the menhir having indications of eyes, nose, mouth and breasts, but rather with the esoteric symbology of the holed stone.

Mystery dramas, in which the initiate actually passes through the circular gate of exit from "91s mother's womb'r to that new life, and domestic altars on which phalius and holed stone are not the accessories of indocent rites but the emblems of an exalled interpretation of the twin principles of life, must have been sufficiently common to perpetuate, as appears to have been the case, the esoteric significance of these symbols through long ages. We see the origin of the doubly solemn nature of an asseveration or contract made by passing the hand through a holed stone, and of the idea of passing sick children boddly through such stones. The clut of the lingum stone in India to-day illustrates this point.

Thus, no doubt, many of the rude stone monuments characteristic of Britany, Conwall, Wales, Socialand, Ireland, etc., came to have their connection in folk-lore and folk memory with fertility cuts, the furtive practice of whose associated ries might well be condemned by the unthinking as fundamentally indecent, and by the early Christian Church as subversively pagan. Such monuments, therefore, are not so much primitive in themselves as relices of a highly elaborate order of ideas,

The ideas connected with pillar and holed-stone cults probably go back to 2500 or 3000 B.C., although not introduced into Western Europe till somewhere about 600 to 200 B.C. Long before that, however, men probably put up small rude bourns and memory stones (where stone was available) as more permanent than marked trees or wooden posts or carris of loose stones. It is difficult to disentangle, from among a welter of stone monuments (such, eg, as those at Carnac which range from small unhewn pillars 2 feet high to elaborately chambered barrows), primitive commemorative menhirs that may have survived from an earlier day The more pumitive-seeming stone monuments-menhirs in 1solation—are almost invariably found in districts where the elaborate chambered barrow, the cromlech and the stone avenue are equally characteristic. In the Naga Hills, lying between Assam and Burma, we can observe a rather primitive society electing just such menhirs as we see in the megalithic districts of Western Europe, to mark social occasions and events of their lives Such primitive monuments as standing-stones are erected by men according to a prescribed efiquette to commemorate contemporary events of their own lives and need not necessarily be either funereal or in the nature of witness-stones or boundary-marks It is arguable that the stone-raising Nagas, like the peasants of Ireland or Brittany with their cults of the stones, are merely keeping alive customs which originated in a more complex society, and certain other Naga customs connected with the use of stone and the symbolism of horns bear this out.

When, therefore, we come to deal with such stone monuments as are really rude human efficies, we are far away from the symbolical ideas already discussed Primitive folk to-day provide the disembodied spirit with an effigy, preferably near his grave, thus preventing him from taking up his abode in an already

occupied body.

Alignments, cromlechs and denuded dolmens are not strictly primitive, as has been demonstrated by excavation in Brittany (see Carrac, Megalithic Monuments).

STONE MOUNTAIN MEMORIAL. Stone mountain, about 15 mi. N E. of Atlanta, Ga, 18 a gray monadnock, shaped like a half parabola, 650 ft. high, covered with growths of mosses and briens and various plants, including rare varieties.

and lichens and various plants, including rare varieties.

In 1916 the sculptor, Gutzon Bouglum (1834—1941) (7 v.), conceived the plan of carying upon the side a huge memoral to the valour and loyalty of the south to the lost Confederate cause.

The design, 200 ft. high and 1,300 ft long, was to represent the amy of the Confederacy with Robert E. Lee and other souther leaders at its head. Work was begun by Borglum in 1917, interrupted by World War I, and continued in 1923—25 when a dispute with the Stone Mountain Monumential association, which raised the funds, resulted in his dismissal.

In 1926 Augustus Lukeman was employed as Borglum's successor. Borglum's head of Lee was unveiled m 1924 and a section of Lukeman's work was unveiled in 1928, but the total then accomplished represented but a corner of one section of the complete design.

STONE RIVER, BATTLE OF, a battle of the American Civil War, called the battle of Murfreesboro by the Conselectates, fought on Dec. 31, 1863, and Jan. 2, 1863. After his appointment in October to command the Army of the Cumberland, Gen W. S. Rosecrans, with Chattanooga as his objective, moved from Nashulle upon Gen. Braxton Bragg, who left the winter quarters he had established at Murfreesboro and met the Union army on Stone river immediately north of Murfreesboro, on the last day of December. The plan of attack on each sade was to crush the enemy's right. Bragg's left, commanded by Leeut, Gen. W. J.

Hardee, overlapped and bore back the Union right under Maj gen A McD McCook, and May-gen T L Crittenden, commanding the Union lett, was hurriedly called back from his attack on the Confederate right to support McCook The Union right was crumpled up on the centre, where Maj -gen G. H Thomas's corps checked the Confederate attack There was practically no fighting on Jan 1, but on the 2nd the Confederates renewed the attack, Maj -gen. J C Breckinridge with Bragg's right attempting in vain to displace one of Crittenden's divisions which had established itself during the 1st on high ground across the river. On the night of the 3rd Bragg withdrew and the Union army occupied Murfreesboro Tactically a drawn battle, Stone River was strategically a Union victory. The losses on both sides were heavy of 37,712 Confederates present for duty, 1,294 were killed, 7,945 were wounded, and about 2,500 were missing; and of 44,800 Union soldiers present for duty, 1,677 were killed, 7,543 were wounded, and 3,686 were missing

See A F Stevenson, The Battle of Stone's River (Boston, 1884), and W. J Vance, Stone's River, the Turning-Point of the Civil War

STONEWORT, the common name for Algae (q v.) of the class Charophyceae, so called from the deposit of lime in their cells They grow in fresh and brackish water
STONINGTON, a borough of Connecticut, USA Pop

(1950), 1,739 There is a good harbour In the 18th and 19th centuries whaling and sealing were important industries Nathaniel B. Palmer, who discovered Palmer Land in the Antarctic early in the 19th century, was a whaling captain of Stonington The village was a military depot during the Revolution, and in Aug 1775, was bombarded by a British frigate. In 1801 it was incorporated as a borough, the first in the state. An attack by a British squadron in Aug 1814 was repulsed

STONY POINT, a township in Rockland county, NY U.S.A. Pop (1950) 5,485 Area, about 30 sq. miles. It was named from a rocky promontory which juts into the Hudson During the Revolutionary War it was of considerable strategic importance. The Americans occupied it in Nov. 1776, and about two years later erected a blockhouse upon it The garrison, however, was very small, and on May 31, 1779, it was taken by the British, who immediately erected much stronger fortifications. On the night of July 15-16, it was recovered by Gen Anthony Wayne, in command of about 1,350 picked American troops, the garrison (under Lieut Col. Henry Johnson) losing 63 killed, 70 wounded and 543 taken prisoner. The American loss was only 15 killed and 83 wounded The Americans, however, had no thought from the first of holding the place and evacuated it on July 18, whereupon it was reoccupied by the British, but late in October they, too, abandoned it In the "old Treason house" (no longer standing) Gen Benedict Arnold and Major John Andre met in the area before daylight on Sept. 22, 1780, to settle plans for the surrender of West Point by Arnold to the British

STOOLBALL. Of the ancient game of stoolball very little indeed is known, and it has nothing whatever in common with the modern game which, since 1916, has made astonishing progress. During the war a simple but not strenuous outdoor game was very badly needed for wounded officers, soldiers and sailors; and the idea occurred to Maj. W W Grantham, who was stationed at Brighton, that the old game of stoolball adapted to modern requirements, would be suitable for the purpose. The game was soon played in scores of hospitals and convalescent homes, in England and France. He made a few simple rules adapted from cricket, and the first public match took place on the County cricket ground of Hove in 1917

In 1924 a Stoolball Association was formed at Lord's, and by the end of 1927 it was estimated that nearly 3,000 clubs had become members. In Sussex alone the game is played in hundreds of villages, and by large numbers of schools of all kinds, women's institutions and girl guides associations It has been intro-duced into Iceland, Japan, Siberia, Switzerland and Finland.

The materials required for the game are very few and very simple, and although with the exception of the ball they can be easily and quickly made by any carpenter they may now be obtained from most of the outfitters Two bats, a ball, and two wickets comprise the materials. The bats are wooden, made like a racket, the diameter of the round part being not more than  $7\frac{1}{2}$ in , and, including the handle, the bat must be not more than 18in in length. The ball is usually known as "best tennis No 3," but a hard lawn tennis ball will serve the purpose Each of the two wickets consists of a board ift square fastened to a stout post which must be firmly fixed in the ground in such a way that the top of the board is 4ft 8m above the ground; a tripod is often substituted for the post

The wickets must be fixed at a distance of 16yds from each other, and a bowing crease not more than 1vd in length must be marked at a spot royds from each wicket, for this is where the bowler stands. The bowling is underhand, and the number of balls to an over, originally ten, has been reduced to eight. A batsman may be bowled, caught, or run out (the ball hitting the face of the board), or may be given out "body before", runs are made just as in cricket In order that the batsman shall be out, "bowled," the ball must hit the face or edge of the wicket (but not the stump), without having previously touched the groundin other words the ball must be a full pitch. On all points for which there are no special rules, the laws of cricket, as far as possible, hold good for stoolball The game can be played on any piece of ground which is fairly level and not so rough as to be dangerous, the minimum space required would be about half the size of an ordinary cricket ground

The ancient form of the game was once very popular in England, and was commonly considered to be the ancestor of cricket. Writing in 1801, Joseph Strutt gives a description of it

See W. W Grantham, Stoolball Illustrated and How to Play it. (W. A. BE)

STORACE, STEPHEN (1763-1796), English composer, was born in London but studied (under his father, Stefano Storace, an Italian contrabassist) at the Conservatorio di Sant' Onofrio, at Naples His first opera, Gli Sposi malcontenti, was produced at Vienna, in 1785 Here he made the acquaintance of Mozart, in whose Nozze di Figaro his sister, Anna Sehna Storace, first sang the part of Susanna. Here also he produced a second opera, Gli Equivocs, founded on Shakespeare's Comedy of Errors, and a Singspiel entitled Der Doctor und der Apotheker. In England. after creating a favourable impression by bringing out his Singspiel at Drury Lane, under the title of The Doctor and the Apothecary, Storace attained his first great success m 1789, in The Haunted Tower, an opera which ran for fifty nights in succession. The music of The Pirates (1792) affords one of the earliest instances of the introduction of a grand finale into an English opera.

Storace's music is pre-eminently English He doubtless learned See H P. Johnston. The Stormag of Story Pount (1900); E. H. something from his silect Anna (1706-1877), a brilliant: single Hall and F. W. Halsoy, Story Pount Battle-Field (1900); and D. Cole who died leaving £50,000. Storace himself died on March 19, 1796.

## STORAGE BATTERY: SEE BATTERY.

STORK, the name for various large to very large long-legged, long-necked, large-billed birds related to the herons and this and placed with them in the order Ciconnformes. The 17 species of typical storks form the family Ciconiidae They frequent open fields and shallow water, where they stalk about looking for their food of insects, fish, frogs or almost any other small animal. Some storks, such as the adjutant, Leptoptilos dubius, of India, and the marabou, L. crumeniferus, of Africa feed on carrion.

During the nonbreeding season they are often in flocks, and at times soar majestically high in the air. Their voices are little more than grunts or peeps, but storks commonly make a rattling noise by snapping their great mandibles together. While stately, or impressively grotesque in everyday activity, at mating time storks perform grotesque dances, hopping about with spread wings and clattering mandibles The nests are bulky affairs, usually placed in trees, sometimes in colonies. The eggs are white and unmarked, the young are down-covered and are cared for in the nest by the parents. In plumage storks may be mostly glossy black, or black and white, the head feathered or naked and with brightly coloured lapets on the bill, depending on the species

Most storks live in the old world where the group is widespread, only three occurring in tropical America, including the jabiru, Jabiru mycteria, and wood ibis, Mycteria americana.

The white stork, Cicoma cicoma, of Europe is one of the bestknown birds. It stands more than three feet high and is white with black in the wings. It nests on houses where platforms are sometimes put up for it, and it is thought to bring good luck. The hammerkop (q v ) stork, Scopus umbretta, of Africa is the only species in the related family Scopidae and the whale-headed stork, Balaensceps rex, of Africa is the only species in another related family, Balaenicipitudae. (A, L, RD.)

STORM, THEODOR WOLDSEN (1817-1888), German poet and novelist, was born at Husum, Schleswig, on Sept 14, 1817, and studied jurisprudence at Kiel and Berlin, where he formed a close friendship with the brothers Theodor and Tycho Mommsen. Storm is hardly less remarkable as a lyric poet than as a novelist. As the former, he made his debut, with the two Mommsens, with As the former, he made no sebus, with the two Mommsens, with Lederbuck drew Freunde (1843); but his Gedichie (1852), in the wake of Exchendorff and Morine, first dutained for him general received the second of th

tovo).

STORM. This term is sometimes applied to any disturbed atmospheric condition, but more often only to the violent disturbances. Windstorm, thunderstorm, snowstorm, sandstorm, duststorm, etc., are more specific terms Ordinary cyclones  $(q\ v)$  are frequently referred to as storms. In hydrology, the name is applied to an area of rapidly accumulated rainfall whether caused by one meteorological storm, a series of them or only a portion of one. In the Beaufort scale (q.v.) a wind of force II (64 to 75 m.p.h.) is called a storm wind. (For magnetic storms see TERRESTRIAL MAGNETISM.) (HRB)

STORMBERG, ACTION OF (Dec. 10, 1899): see South

AFRICAN WAR, 1899-1902 STORNOWAY (Norse, Stjarna vogr, "Stjarna's bay"), a small burgh, the principal town of Ross and Cromarty, Scot. Pop. (1951), 4,954. It is situated on the east coast of Lewis, at the head of a harbour accessible for steamers of 3,000 tons. Stornoway, which was made a burgh of barony by James VI. is the centre of the Outer Hebrides fishery district and during the herring season the population is very largely increased. Steamers run daily in summer to Mallaig and weekly to Glasgow. Belfast, Leith and Liverpool.

STORY, JOHN (c. 1510-1571), English martyr, was educated at Oxford, where he became lecturer on civil law in 1535. being made later principal of Broadgates hall, afterward Pembroke college. He appears to have disayowed his Roman Catholic opinions just after the accession of Edward VI, but having been chosen a member of parliament in 1547 he gained notoriety by his opposition to the Act of Uniformity in 1548. For crying out "Woe unto thee, O land, when thy king is a child," he was imprisoned by the house of commons, but he was soon released and went into exile. Returning to England in 1553, he resigned his position at Oxford, which was now that of regius professor of civil law, and was made chancellor of the dioceses of London and of Oxford and dean of arches. Story was one of Queen Mary's most active agents in prosecuting heretics, and was one of her proctors at the trial of Cranmer at Oxford in 1555. Under Elizabeth I he was again returned to parliament, but in 1560 he under-

went a short imprisonment for boasting about his work in the former reign. In 1563 he was again arrested, but managed to escape to Flanders, where he became a pensioner of Philip II of Spain. The duke of Alva authorized him to exclude certain classes of books from the Netherlands and, in 1570, while engaged in this work, he was decoyed onto a ship at Antwerp and conveyed to Yarmouth In spite of his claim that he was a Spanish subject, he was tried for high treason and executed at Tyburn on June 1. 1571. In 1886 Story was beatified by papal decree

STORY, JOSEPH (1779-1845), US jurist, was born at Marblehead, Mass, on Sept 18, 1779 He graduated from Hárvard in 1708 and was admitted to the bar at Salem. Mass., in 1801. a Democrat. In Nov 1811, at the age of 32, he became, by Pres James Madison's appointment, an associate justice of the US supreme court This position he retained until his death. Soon after Story's appointment, the supreme court began to bring out into plain view the powers which the constitution had given it over state courts and state legislation

The leading place in this work belongs to Chief Justice John Marshall, but Story has a very large share in that remarkable series of decisions and opinions, from 1812 until 1832, by which the work was accomplished. In addition to this he built up the department of admiralty law in the US courts, he devoted much attention to equity jurisprudence and rendered invaluable services to the department of patent law. In 1819 he attracted much attention by his vigorous charges to grand juries, denouncing the slave trade, and in 1820 he was a prominent member of the Massachusetts convention called to revise the state constitution In 1829 he became the first Dane professor of law at Harvard university, and continued until his death to hold this position. He died at Cambridge, Mass, on Sept. 10, 1845.

He died at Cambridge, Mass, on Sept. 10, 1845.

Among his publications are Commentaries on the Law of Bailments (1832), a work of profound learning which is still the standard (1833), a work of profound learning which is still the standard by many regarded as his ablest work; Commentaries on Equity Iuri-produces (1835-50), Equity Pleadings (1838), Law of Agency (1830), Law of Partnership (1841), Law of Balls of Evchange (1843), and Law of Frentheyn Notes (1845) ones for the Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Joseph Story (Boston and London, See The Life and Latters of Latt

STORY, WILLIAM WETMORE (1819-1895), US sculptor and poet, was born at Salem, Mass., Feb 12, 1819 A graduate of Harvard college (1838), he studied law under his father, Justice Joseph Story, and for six years he only wrote poetry and criticism, modelled and painted to amuse himself. A request that he make the public monument to his father resulted in a journey abroad, which caused him to find that his "heart had gone over from the Law to Art." Thereafter he spent his life in Italy, where he died, Oct 7, 1895 What Nathaniel Hawthorne called "his perplexing variety of talents and accom-plishments" prevented his high contemporary reputation from becoming permanent. His statue of Cleopatra is most famous because of the enthusiastic description in Hawthorne's Marble Faun; typical of the majority of his sombre feminine figures are "Semiramis" and "Medea" in the Metropolitan museum, New York city His Poems (1885), He and She; or, A Poet's Portfolio (1884) and A Poet's Portfolio: Later Readings (1894) show his love of beauty, but, like his statues, they lack vitality, as do his other books.

See Henry James, William Wetmore Story and His Friends (1903); Lorado Tait, History of American Sculpture (1924).

STORY: see Shorr Story.
STOSS, VEIT (1438 or 1440-1533), German sculptor and wood carver, was born in Nuremberg. In 1477 he went to Cracow, where he was actively engaged until 1499. It was there that he carved the high altar for the Marienkirche, between 1477 and 1484. On the death of King Casimir IV in 1492 Stoss carved his tomb in red marble for the cathedral in Cracow. He also executed the marble tombstone of the archbishop Zbigniew Ollsnicki in the cathedral at Gnesen and the Stanislaus altax for the Marienkirche at Cracow. In 1406 he returned to Nuremberg where he did a great deal of work in completing altars His main works are: a relief with the Coronation of the Blessed Virgin in the Germanic museum at Nuremberg, a statue of the Blessed Virgin in the Frauenkirche, the Annunciation in the Lorenzkirche, and the cir- and large ironworks, nails and other iron goods being made, cular rosary in the Germanic museum

STÖSSEL, ANATOLI MIKHAILOVICH (1848-1915), Russian general, boin at St Petersburg (Leningrad), on July 10, 1848, entered the Russian aimy in 1864. He served in the Russo-Turkish War of 1877-78 and in the Boxer campaign of 1900 At the outbreak of the Russo-Japanese War (1904) he was placed in command at Port Arthur. After a prolonged defence (see Russo-JAPANESE WAR) he surrendered the city to the Japanese (Jan 2, 1005). He was tried by court-martial and imprisoned Stossel was released in May 1909 He died in January 1915.

STOTHARD, THOMAS (1755-1834), English subject painter, was boin in London on Aug 17, 1755 After a delicate childhood, he was apprenticed in Spitalfields to a draughtsman of patterns for brocaded silks In 1778 he became a student of the Royal academy, of which he was elected associate in 1792 and full academician in 1794. In 1812 he was appointed librarian. He

died in London on April 27, 1834

In 1780 he became a contributor to the Novelist's Magazine, for which he executed 148 designs, including his 11 admirable illustrations to Peregrine Pickle and his graceful subjects from Clarissa and Sir Charles Grandison He contentedly designed plates for pocketbooks, tickets for concerts, illustrations to almanacs, portraits of popular players-and into even the slightest sketches he infused grace and distinction. He is at his best in domestic or ideal subjects, the heroic and the tragic were beyond his powers. His oil pictures are usually small in size, and rather sketchy in handling; but their colouring is often rich and glowing, Stothard having been a great admirer of Rubens. The "Vintage," perhaps his most important oil painting, is in the National gallery. His best-known painting is the "Procession of the Canterbury Pilgrims," also in the National gallery, the engraving from which attained an immense popularity.

Among his illustrations are the two sets to Robinson Crusse, one for the New Megazame and one for Stockdale's edition, and the plates to The Pilgran's Proyects (1983), to Hardnag's edition of Goldston to the works of Gesner (1803), to Cowper's Pootons (1883), to The Decemeron, the editions of Roger's Haby (1830) and Proms (1834), to The Decemeron, the editions of Roger's Haby (1830) and Proms (1834) to The Stockmar also defeorated the grand starcase of Bunghley house, (1810) and the cupola of the upper hall of the Advocates' history, Cathoburgh London eccupied by the Signet History), with Apollo and the Muses, and figures of poets, oration, etc. (1837). His designs for executed, owing to the death of Ceorge IV, He also designed the magnificent shield presented to the dule of Wellington by the mechanist of London, and executed with his your hand as series of eight Among his illustrations are the two sets to Robinson Crusoe, one

chants of London, and executed with his own inhol a series of eight etchings from the various subjects which adonned it.

An interesting but most indiscriminately eulogistic biography of Stothard, by his daughter-in-law, Mrs. Bray, was jublished in 1855. A. C. Coxhead's Fibonas Stothard, R. A., an Illustrated Mongraph (1964), contains a short biographical chapter, and an accurately dated summary of the various books and periodrals illustrated by Stothard; see also Austin Dobons, lighteent Century Vignattes.

STOUR, the name of several English rivers, an ancient word of doubtful etymology. (1) The East-Anglian Stour rises in southeast Cambridgeshire and flows 47 mi. to the North sea at Harwich. (2) The Kentish or Great Stour rises on the south of the North Downs, one branch, the East Stour, rising N.W. of Hythe but flowing away from the sea, while the western branch rises near Lenham and the two unite at Ashford. Passing Canterbury, the Stour again divides: the Great Stour, joined by the Little Stour, flows east to Pegwell bay; the small branch enters the North sea near Reculver. It is navigable to Fordwich. Its length is about 40 mi. Other rivers named Stour are: (3) a tributary of the Hampshire Avon: (4) a left-bank tributary of the Severn, which it joins at Stourport; and (5) a small tributary of the Warwickshire Avon, rising west of Banbury,

STOURBRIDGE, a municipal borough in the Stourbridge parliamentary division of Worcestershire, England, 143 mi. W.N.W. from London by the G.W.R. Pop. (1951) 37,247. Area, 6.6 sq.mi. The grammar school, in modern buildings, was founded in 1430 and the Hospital school in 1670. The Vine inn is a 16th century half-timbered building. There are coal mines

21-Q

though the chief trade is in fire bricks. The glass manufactory was established in 1556.

STOURPORT-ON-SEVERN, an urban district of Worcestershire, England, 4 mi SW of Kidderminster. (1951) 10,140 Area, 5 sq mi. An electrical generating station serving Shropshire, Worcestershire and Staffordshire is there The town is more industrial than formerly, though the river traffic is less extensive. At Redstone is a hermitage excavated out of

the red sandstone bank of the Severn.

STOUT, SIR ROBERT (1844-1930), New Zealand judge and statesman, was born on Sept. 28, 1844 at Lerwick, Shetland Isles, where he became a pupil teacher at the parish school in 1857 In 1863 he went to New Zealand, where he taught until he began to study law in 1867, being admitted as barrister and solicitor of the supreme court of New Zealand on July 4, 1871 He served in the Otago provincial council from 1872-76, acting concurrently (1874-75) as provincial solicitor and as Liberal M.P. for Caversham (1875). As a member of parliament, he was an important force in the formation of the Liberal party in New Zealand. In Feb. 1878 he became attorney general and minister of lands and immigration in Sir George Grey's ministry. He resigned in 1870 but returned to public life in 1884 as member for Dunedin East. On the defeat of Sir Harry Atkinson's government he joined Sir Jules Vogel in forming a ministry (Aug. 16-28, 1884), but after another Atkinson government had held office for a few days (Aug. 28-Sept. 3) a second Stout-Vogel government was formed which lasted three years. In both the Stout-Vogel governments Stout was premier, attorney-general and minister of education. At the general election in 1887 he lost his seat. In 1893 he was elected as an independent Liberal for Inangahua, at a by-election, and at the general elections of 1803 and 1896 he was elected for Wellington city. In 1898 he resigned his seat and from 1899-1926 served as chief justice of New Zealand. From 1926-30 he was a member of the country's legislative council. In 1886 he was made K C M G.

Stout's principal measures were the Land act of 1877; the first Land Tax act (which he drafted in co-operation with John Ballance and which became law in 1878); the Hospitals and Charitable Institutions act of 1885; and the Civil Service Reform act of 1886. As a member of a royal commission appointed in 1881 he helped Allen Holmes to form the code of civil procedure, which was enacted in 1882 and which made the supreme court procedure of New Zealand one of the simplest in the world Stout was chancellor of New Zealand university from 1903-23 and a member of that institution's senate from 1884-1930, as well as being associated with Otago university and Victoria college as member of their respective councils He died in Wellington, July 19, 1930.

BIBLIOGRAPHY —Stout's works include Leasing State Lands (1875); State Louis (1875).

STOW, JOHN (c. 1525-1605), English historian and anti-quary, was born about 1525 in London. He learned the trade of his father, a tailor, but possibly did not practise it much after he grew up. In 1561 he published his first work, The Woorkes of Geffrey Chaucer, Newly Printed With Divers Addicions Whiche Were Never in Printe Before. This was followed in 1565 by his Summarie of Englyshe Chronicles, which was frequently reprinted, with slight variations, during his lifetime. In 1580 Stow published his Annales, or a Generale Chronicle of England from Brute Until the Present Years of Christ 1580.

The work by which Stow is best known is his Survey of London, published in 1598, not only interesting from the quaint simplicity of its style and its amusing descriptions and anecdotes, but of unique value from its minute account of the buildings, social condition and customs of London in the time of Elizabeth, Through the patronage of Archbishop Patker, Stow was enabled to print the \*Plores instornarum\* of Matthew of Westmuster in 150°, the Chromole of Matthew Paris in 1571°, and the \*Historna breuss of Thomas Walsingham in 1574. At the request of Parker he had himself compiled a "farre larger volume," An history of this silond, but the manuscript is lost Stow remained poor all his fie, and was authorized by James I to appeal for alms in 1604. He died on April 6, 1605, and was buried in the church of St Andrew Undetshaft, where is, his monument.

A number of Stow's manuscripts are in the Harleian collection in the Bitish Museum Some are in the Lambeth library (No 306), and from the volume which includes them were published by the Camden Society, edited by James Gardner, Three Fifteenth-Century Chronicles, with Historical Memoranda by John Stowe the Antiquary, and Contemporary Notes of Occurrences written by Jam (1880).

of the many editions of Stow's Survey of London, see that with notes by C L Kingsford (Oxford, 1908).

STOWE, HARRIET ELIZABETH (BEECHER) (1811-1896), American writer and philanthropist, seventh child of Lyman and Roxana (Foote) Beecher, was born at Litchfield (Conn ), June 14, 1811 Her parents were descended from founders of New Haven, and the community in which she spent her childhood was one of the most intellectual in New England. At her mother's death, in 1815, she came most directly under the influence of her eldest sister, Catherine, a woman of keen intellect, who a few years later set up a school in Hartford, to which Harriet went, first as a pupil, afterwards as teacher. In 1832 her father, who had for six years been the pastor of a church in Boston, accepted the presidency of the newly-founded Lane Theological seminary at Cincmnati Catherine Beecher, who was eager to establish what should be in effect a pioneer college for women, accompanied him; and with her went Harriet as an assistant, taking an active part in the literary and school life, contributing stories and sketches to local journals, and com-piling a school geography She was married Jan 6, 1836, to one of the professors in the seminary, Calvin Ellis Stowe. In the midst of privation and anxiety, due largely to her husband's precarious health, she wrote continually, and in 1843 published The Mayflower, or Sketches of Scenes and Characters among the Descendants of the Pilgrims She hved 18 years in Cincinnati, separated only by the Ohio river from a slave-holding community, coming in contact with fugitive slaves, and learning from friends and her own visits the life of the South. When, therefore, in 1850, Mr Stowe was elected to a professorship in Bowdoin college, Brunswick (Me.), and removed his family thither, Mrs. Stowe was prepared for the great work which came to her, bit by bit, as a religious message which she must deliver. There she wrote, for serial publication in the National Era, an anti-slavery paper of Washington (D C), the story of Uncle Tom's Cabin; or, Life Among the Lowly. The publication in book form (March 20, 1852) was a factor which must be reckoned in summing up the moving causes of the Civil War. The book sprang into unexampled popularity, and was translated into at least 23 languages. Mrs. Stowe reinforced her story with A Key to Uncle Tom's Cabin, in which she accumulated a large number of documents and testimonies against the great evil; and in 1853 she made a journey to Europe, devoting herself especially to creating an entente cordiale between English and American women on the question. In 1856 she published Dred: a Tale of the Dismal Swamp, in which she threw the weight of her argument on the deterioration of a society resting on a slave basis. The establishment of the Atlantic Monthly, in 1857, gave her a constant vehicle for her writings; also the Independent of New York, and later the Christian Union, of which papers successively her brother, Henry Ward Beecher, was one of the editors.

From this time she led the life of a woman of letters, writing novels, of which The Minister's Wooing (1859) is best known, and many studies of social life in the form both of faction and easay. Her Pear of or's Jained (1863), Sarah Orne Jewett credited with having revealed to her the literary value of the country folk. Miss. Stowe polished also a small volume of re-

lagious poems, and towards the end of her career gave some public readings from her writings. In 1832 FOr Stowa excepted a professorship in the Theological semmary at Andover (Mass.), and the family made its home there till 1863, when he redde wholly from professional life and removed to Hartford After the close of the war for the Union, Mrs Stowe bought an establishment of the stop of the store of the constant of the war for the Union, Mrs Stowe bought and estate in Flouda, chiefly in hope of restoring the health of her son, Capt. Frederick Beecher Stowe, who had been wounded in the war, and there she spent many winters. After the death of her hushand in 1886, she lived in the sections of her Hartford how, where she chied on July 1, 1806. She is buried by the side of her hushand in 1880 and Andover.

16 volumes (with an additional volume of biography) (H E S) STOWELL, WILLIAM SCOTT, BARON (1745-1836), English judge and jurist, was born at Heworth, near Newcastle, on Oct 17, 1745. His younger brother John became the famous Lord Chancellor Eldon Scott was educated at the Newcastle grammar school and Corpus Christi college, Oxford In 1779 he graduated as doctor of civil law and, after the customary "year of silence," commenced practice in the ecclesiastical courts. In 1783 he became registrar of the court of faculties; in 1788 judge of the consistory court and advocate general, and in 1708 he was made judge of the high court of admiralty. Sir William Scott twice contested Oxford university-in 1780 without success, but successfully in 1801. He also sat for Downton in 1700 Upon the coronation of George IV (1821) he was raised to the peerage as Baron Stowell. Lord Stowell retired from the bench-from the consistory court in Aug 1821, and from the high court of admiralty in Dec 1827. He died on Jan. 28, 1836. The doctrines of international law with the assertion and illustration of which the name of Lord Stowell is identified are these the perfect equality and entire independence of all states ("Le Louis," 2 Dod 243)-a logical deduction from the Austinian philosophy and still one of the fundamental principles of English jurisprudence; that the elementary rules of international law bind even semibarbarous the elementary ruse of international and non-zero seminosconstates (the "Hurtige Hane," 2 Rob 325," that blockade to be binding must be effectual (the "Betsey," 1 Rob, 33); and that contraband of war as to be determined by "probled elestimation" (the "longe Margaretha," 1 Rob, 189). In the famous Swedish convoy case (the "Man," 1 Rob, 325; see, too, the "Recovery," 6 C. Rob. 348-9) Lord Stowell asserted that "a prize court is a court not merely of the country in which it sits but of the law of nations."

STOWMARKET, a town in Suffolk, Eng. Pop (1951)
7,335. Area 2.6 sq.mi. The church of SS. Peter and Mary is Decorated and Early English, with a tower and wooden spire. The vicarrage has associations with Milton through his tutor, Young.

STRABANE, urban district and principal town of County Tyrone, Northern Ireland. Pop. (1951) 6,620. Area, 2,9 sq.mi. The Mourne and Finin rivers join there and thenceforward form the Foyle. The trade in corn is considerable. Shirt and collar making is the chief industry

STRABO (Strakovs) (horn 6.65 n.c.), Greek geographer, was born at Amasis in Pontus, a city which had been much Hellemzed. He studied at Nysa under the grammarian Aristodemus, under the grammarian Tyrannio at Rome, under the philosopher Xenarchus, and he studied Aristotle with Boethus. He also states that he saw P. Servillus Issurrus, who died at Rome in advanced years in 44 n.c., from which it has been inferred that he visited Rome early in life. He also tells us that he was at Gyaros (one of the Cyclades) when Augustus was at Corinth on his return to Rome from the east in 29 n.c., and that he accompanied the prefect of Egypt, Achius Gallus, on his expedition to upper Egypt, which seems to have taken place in 25-a8 xc. These are the only dates in his life

which can be accurately fixed The latest event mentioned in his work is the death of Juba, king of Mauretania, in AD 27 Although he had seen a comparatively small portion of the regions which he describes, he had travelled much As he states "Westward I have journeyed to the parts of Etruria opposite Sardinia. towards the south from the Euxine to the borders of Ethionia." His Geography was finally revised between A.D. 17 and 23

Works .- His earliest writing was a historical work now lost, which he himself describes as his Historical Memoirs He tells us (x1, q, 3) that the sixth book of the Memours was identical with the second of the Continuation of Polybius, probably, therefore, hooks 1-1v formed an introduction to the main work Plutarch. who calls him "the Philosopher," quotes Strabo's Memours (Luc 28), and cites him as a historian (Sulla, 26) Josephus calls him "the Cappadocian," and often quotes from him

The Geography is the most important work on that science which antiquity has left us It follows Eratosthenes, who had first laid down a scientific basis for geography The earlier book was too small to contain the description of separate countries which Strabo included The historical notices are all his own. He regarded Homer as the source of all wisdom and knowledge-indeed. his description of Greece is largely drawn from Apollodorus' commentary on the Homeric "Catalogue of Ships"-and treated Herodotus with undeserved contempt, classing him with Ctesias and other "marvelmongers,"

Strabo chiefly employed Greek authorities (the Alexandrian writers Polybius, Poseidonius and Theophanes of Mytilene, the companion of Pompey) and made comparatively little use of Roman authorities He probably amassed his material in the library of Alexandria, so that Greek authorities would naturally furnish the great bulk of his collections, and then returned to Rome. where he perhaps used the chorography of Agrippa, a map of the

Roman empire set up in the Porticus Vipsaniae.

The Geography consists of 17 books, of which the 7th is imperfect The first two are introductory, the next eight deal with Europe, two being devoted to Spain and Gaul, two to Italy and Sicily, one to the north and east of Europe and three to Greek lands The 11th book treats of the main divisions of Asia and the more easterly districts, the next three of Asia Minor. Book xv deals with India and Persia, book xvi with Assyria, Babylonia, Syria and Arabia and the closing book with Egypt and Africa

Syris and Arabia and the assung book with Egypt and Artica Binanous arms.—The Adme echoic Vience, critô was unfortunately based on a very corrupt manuscript. The first substantial improvements were made by I Casaubon (Genew, 153; Paris, 1520), whose text remained the basis of subsequent editions till that of A. Coraes (Paris, 152-19), which removed many corruptors. The manuscripts were first schemidically of the control of the correct of

was born at Aberdeen, Scot., on April 12, 1778. After taking his degree at Aberdeen he emigrated in 1799 to Canada. There he was ordained (1803) and appointed to the parish of Cornwall, and in 1812 to York.

Strachan was appointed to the executive council of Upper Canada in 1815. He was soon the leading spirit in that dominant group known in Upper Canadian history as the "family compact." In 1820 he was appointed by Sir Peregrine Maitland a member of the legislative council in order that the governor might have a confidential medium through whom to make communication to the council. At the instance of the lieutenant governor he went to England in 1824 to discuss various colonial questions with the colonial secretary. He paid a second visit to England in 1826-27 to obtain a royal charter for King's college. In 1827

Strachan became archdeacon of York. The breakup of the Liverpool ministry in 1827 interrupted Strachan's plans for placing the government endowments for religion and education under the Episcopal Church Adverse criticism and a suggestion from the colonial office led to his resignation from the executive council, but he declined to resign from the legislative council

On the death of Bishon Stewart of Quebec the Canadian see was divided, and Strachan was made bishop of Toronto in Aug 1839. He energetically opposed the act of 1840, which sought to settle the clergy reserves question by dividing the proceeds among the different religious denominations, the larger share still

remaining with the Church of England.

The university of King's college was finally established, with certain modifications of its charter, in 1843, Bishop Strachan being the first president. The renewed agitation finally resulted in the elimination of all religious tests by the act of 1849, which also changed the name to that of the University of Toronto Strachan at once took steps to found another university which should be completely under the control of the Episcopal Church, hence the establishment of Trinity university, which was opened in 1852 Bishop Strachan also raised once more the question of the disposal of the clergy reserves, which were completely secularized in 1854 He died in November 1867.

STRACHEY, GILES LYTTON (1880-1932), British critic and biographer, son of Sir Richard Strachey, the Indian administrator, was born on March 1, 1880, and educated at Trinity college. Cambridge. He was a leading figure in the remarkable "Bloomsbury" circle which included his Cambridge friends I M Keynes, Desmond MacCarthy, Leonard Woolf and Clive Bell and also the two daughters of Sir Leslie Stephen, Vanessa Bell and Virginia Woolf. In 1912 he published Landmarks in French Laterature and throughout his life did much by his articles to make his countrymen appreciate the precision and delicacy of French poetry and prose. His greatest achievement, however, was in biography. He made his reputation with Emment Victorians (1018) and Queen Victoria (1921) and added to it with Elizabeth and Essex (1928) and Portraits in Miniature (1931) Strachev made a revolution in the writing of biography. Treating his subjects from a highly idiosyncratic point of view, he determined to create a work of art rather than to record activities and events fascinated by personality and motive and delighted in pricking the pretensions of the great and reducing them to life-size in a prose style that was at once elegant, sinuous and singularly ironical.

His aim was to paint a portrait, and though this led to caricature and sometimes, through tendentious selection of material, to inaccuracy, he taught biographers a sense of form and of background as well as sharpening their critical acumen. His many imitators also hastened to "debunk" the past, but they lacked Strachev's detachment, taste and Voltairean assurance; nor could they rival his best work, Queen Victoria, in which Strachey combined his gift for narrative with a power of analyzing characters with whom he had nothing in common. His defects as a biographer arose mainly from his clear but limited vision of life. He did not love the past for its own sake; and he saw politics largely as intrigue, religion as a ludicrous anachronism and personal relations as the supremely important facet of life. Though bitterly attacked during and after his lifetime, Strachey remains a phenomenon in English letters and a pre-eminent English humorist and wit.

Two collections of essays, Books and Characters (1922) and Characters and Commentaries (posthumously in 1933) were also published. Strachey died unmarried on Jan. 21, 1932,

(N. G. A.) STRACHEY, JOHN ST. LOE (1860-1927), British journalist, was born at Sutton Court, Somerset, on Feb. 9, 1860, the second son of Sir Edward Strachey, 3rd bart., and Mary Isabella, daughter of John Addington Symonds He studied at Balliol college, Oxford, and was called to the bar, but adopted journalism as his profession. After writing for some time for the Saturday Review, the Economist and other papers, he became in 1886, with Charles Graves, editor of the Liberal Unionist, and in the same year assistant editor of the Spectator. After the death of R. H. Hutton and the retirement of Meredith Townsend (1897)

he became proprietor of the Spectator, which, under his editorship not only maintained but increased its great influence upon English opinion St Loe Strachey also edited (1896-97) The Cornhill Magazine He resigned from the editorship of the Spectator in 1025, but continued to contribute to its columns

His publications melude The Manufacture of Paupers (1907), The Problems and Perils of Socialium (1908), The Practical Wisdom of the Bible (1908), A New Way of Life (1906), The Madonia of the Barricades (a novel, 1925), American Soundings (1926)

STRACHWITZ, MORITZ KARL WILHELM AN-TON, GRAF VON (1822-1847), German poet, was born on March 13, 1822, at Peterwitz near Flankenstein in Silesia After studying in Breslau and Berlin he settled on his estate in Moravia. where he devoted himself to literary pursuits He died on Dec 11, 1847, at Vienna in his 25th year He had already revealed a lyric genius of remarkable force and originality His heroic ballads are notable and had much influence upon Theodor Fontane and Detley von Liliencron His first collection of poems. Lieder eines Erwachenden, appeared in 1842 and went through several editions Neue Gedichte were published in 1848

BIBLIOGRAPHY -Strachwitz's collected Gedichte appeared first in 1850 (8th ed , Breslau, 1891), a convenient reprint will be found in Reclaim Universalbibliothek (Leipzig) H M Elster (ed ), Samtliche Lieder und Balladen (Berlin, 1912) has a biography See also T Baumstark, Die Dichtung des Grafen Moritz von Strachwitz (Munster, 1935)

STRADELLA, ALESSANDRO (?1645-1682), Italian composer, one of the most accomplished musicians of the 17th century, was probably boin at Naples The generally accepted story of his life was first circumstantially narrated in Bonnet-Bourdelot's Histoire de la musique et de ses effets (1715) According to this account, Stradella was engaged by a Venetian nobleman to instruct his mistress, Ortensia, in singing Stradella eloped with Ortensia to Rome, where the outraged Venetian sent two paid brave to put him to death On their arrival in Rome the assassins learned that Stradella had just completed a new oratorio, over the performance of which he was to preside on the following day at S. Giovanni in Laterano They determined to kill him as he left the church, but the beauty of the music conquered them, and they warned the composer of his danger. Thereupon Stradella fled with Ortensia to Turin, where, notwithstanding the favour shown to him by the regent of Savoy, he was attacked one night by another band of assassins, who, headed by Ortensia's father, left him on the ramparts for dead. Through the connivance of the French ambassador the ruffians escaped, and Stradella, recovering from his wounds, married Ortensia, by consent of the regent, and removed with her to Genoa There he believed himself safe, but a year later he and Ortensia were murdered in their house by a third party of assassins in the pay of the implacable Venetian Research has, however, driven several holes in this picturesque story

The first certain date in Stradella's life in 1672, in which year he composed a prologue for the performance of Cesti's opera La Dori at Rome; he probably spent a considerable time at Rome about this period, since his cantatas and other compositions contain frequent allusions to Rome and noble Roman families. There is, however, no proof that he ever performed the oration S Giovanni Batissta in the Lateran Documents in the archives at Turin relate that in 1677 he arrived there with the mistress of Alvise Contarini, with that in 1077 he arrived there with the mistress of Alvise Contarin, with whom he had deped from Venice. We hear of Stradella last at Genoa. An opera by him, Le Forma dell' amor paterno, was given there in 1678, and his last composition, It Barcheggio (r.g. a "Water-Music"), was performed on June 16, 1681 in honour of the marriage of Carlo Spinola and Paola Brignole 'That he died at Genoa in Fch. 1682 is established

and Paola Brignole. That he died at Genoa in Feb, 1882 is established by documents in the archives at Modena. Stradella's best operas are It Floridoro, also known as It Mora per amore, and It Trespolo tutore, a comic opera in three acts which worthly carned on the best traditions of Florentine and Roman, comic opera in the 17th century. The oratorio S. Giovanni Battista displays open in the 17th century. The oratorio S. Givenent Bottitis displays from some still in construction and corclestration (or far as the limited in the same still in construction and corclestration (or far as the instruction of the construction of Stradella.

Structura, "J. The finest collection of Stradella's works extant is that at the Biblioteca Esteries at Modena, which contains 148 manuscripts, includ-

ing four operas, six oratorios and several other compositions of a semidramatic character

BIBLIOGRAPHY—Heinz Hess, Die Opern Alessandro Stradellas (Leipzig, 1905), which includes the most complete catalogue vet made of Stradella's extant works, Catelani, Delle Opere di A Stradella instenti nell' archivio musicale della r biblioteca palatina di Modena (Modena, 1865); and Sedley Tayloi, The Indebtedness of Handel to other Composers (Cambridge, 1906)

STRADIVARI, ANTONIO (1644-1737), Italian violinmaker, was associated throughout his life with Cremona, where he brought the craft of violin-making to its highest pitch of perfec-The obscure details of his life were thoroughly worked out in the monograph on him by W H Hill, A F Hill and Alfred Hill (1902) He was still a pupil of Nicolas Amati in 1666, when he had begun to insert his own label on violins of his making, which at first follow the smaller Amati model, solidly constructed, with a thick yellow varnish. It was not till 1684, that he began to produce larger models, using a deeper coloured varnish, and beautifying them in various details, his "long" patterns (from 1690) representing a complete innovation in the proportions of the instrument, while from 1700, plete innovation in the proportions of the materiment, while iron 1760, and otherwise improved his model He also made some beautiful violencellos and violes. The most famous instruments by him are Tolonis the "Halher" (1970), the "Schlier" (dorso, 1680), the "Nucean Yorkota" (1770), the "Holonis (1770), the "Quarke" (1771), the "Violentia" (1770), the "Parke" (1771), the "Wood of "Gillot" (1773), the "Gillot" (1773), the "Gillot" (1773), the "Messia" (1770), the "Banta" (1773), the "Messia" (1770), the "Mess after for a few years returning to an earlier style, he again broadened to the possession of Antomo's stock-in-trade The Stradwan method of voilin-making created a standard for subsequent times, but the secret of his varnish, soft in texture, and shading from orange to red, though much debated, has never been discovered See E. N. Doring, How Many Strads? (Chicago, 1945)

STRAFFORD, THOMAS WENTWORTH, EARL OF (1593-1641), English statesman, son of Sir William Wentworth, of Wentworth Woodhouse, near Rotherham and of Anne Atkins, was born on April 13, 1593, in London. He was educated at St John's College, Cambridge, was admitted a student of the Innei Temple in 1607. In 1614 he represented Yorkshire in the Addled Parliament, but, so far as is now known, it was not till the parliament of 1621, in which he sat for the same constituency, that he took part in the debates.

Wentworth was returned for Pontefract to the parliament of 1624, but appears to have taken no part in the proceedings. In the first parliament of Charles I, June 1625, he again represented Yorkshire, and opposed the demand made under the influence of Buckingham for subsidies for a war with Spain, and was consequently, after the dissolution in November, made sheriff of Yorkshire, in order to exclude him from the parliament which met opposition He was annous to serve the grown, but he disapproved of opposition He was annois to serve the crown, but he disapproved or the king's polecy. After the dissolution of the parhament he was dis-missed from the justiceship of the peace and the office of custor rotulorum of Yorkshire, to which he had been appointed in 1613 He refused in 1627 to contribute to the forced loan, and was imprisoned in

In the parliament of 1628 Wentworth joined the popular leaders in resistance to arbitrary taxation and imprisonment, but he was jealous for the prerogative of the crown, to which he looked as a teserve force in times of criss. A moderate bill supported by Wentworth for securing the liberties of the subject was wiccked between the uncompromising to morries of the subject was whereas between the uncompromising demands of the parliamentary path, who would give nothing to the and the leadership was thus snatched from Wentworth's hands by Eloit and Coke Later in the session he fell into conflict with Eloi, as he desared to modify the Petition of Right.

On July 22, 1658, Wentworth, was created Baron Wentworth, and

received a promise of the presidentship of the Council of the North at the next vacancy He was now at variance with the parliamentary party both on the constitutional and on the religious question. In December he became Viscount Wentworth and president of the Council December he became viscount wentworth and president of the Council of the North In the speech delivered at Yolk on his taking office he said, almost in the words of Bacon "Whoever," he said, "ravels forth into questions the right of a king and of a people shall never be able to wrap them up again into the comeliness and order he found them?"

wrap them up again into the comeanness and order he found them."
The session of 1629 ended in a breach between the king and the
paliament which made the task of a moderator hopeless. He stood
definitely for the maintenance of the king's prerogative
The Policy of Thorough.—In January 1633 Wentwoith was

amed lord deputy of Iteland, and he arrived in Dublin in July 1633 named lord deputy of I teland, and he arrived in Dublin in July 1633. He reformed the administration, getting fit osmanuity of the melicinal control of the property of the control of the country of the cou from a little over £25,000 in 1633-1634 to £57,000 in 1637-1638 Hè raised an army. He swept the pirates from the seas. He reformed and instilled life into the church and rescued church property His etrone and even administration broke down the tyranny of the great men over the poor Such was the government of "Thorough," as Strafford and two poor "Modelman the coverage of "Thopout its great fine of the poor "Modelman the coverage of the poor "Modelman the poo and Lord Mountnorns, the last of whom Strafford caused to be sen-tenced to death no notice to obtain the resignation of his office, and then the control of the control of the control of the control of the be forced into Connaught, and, raking up an absolute tile—found in the 14th century of Connaught to Lionel, dute of Charence, whose her Charles was—he missted upon the grand junes in all the countse faming verdents for the king! High-handed as Wentworth was by get he had never consulted on English alfairs, and it was only in February 15g4 that Charles saked his opinion on a proposed interference in the affairs of the Continent. In reply, he assured Charles that it would be unwassed to undertake even haved open and the proposed interference would be unwassed to undertake even haved open for the continent. absolute power at home. He wished that Hampden and his followers "were well whipped into their right senses." When the Scottish Puri-tans tebelled he advocated the most decided measures of repression. in February 1639 sending the king £2,000 as his contribution to the expenses of the coming war, but he deprecated action before the English army was trained, and advised concessions in religion

army was trained, and advised concessions in religion
Wentworth arrived in England in September 1639, after Charles's
failure in the first Bishops' War, and from that moment he became
Charles's principal adviser In January 1640 he was created earl of
Straiford, and in March he went to Ireland to hold a parliament, where the Catholic vote secured a grant of subsidies to be used against the the Cathonic vote secured a grant of subsidies to be used against the Presbyteran Socia An Irash army was to be leved to assist in the coming war. When a April Strafford returned to England he found the commons holding back from a grant of supply, and Iratl to en-list the peers on the side of the king. On the other hand he induced Charles to be content with a smaller guant than he had organally asked for The commons, however, insisted on peace with the Scoia Charles, on the advice of Vang, returned to his larger defaund of 12 in Charles, on the advice of vane, redulated to in larger demand of its subsidies, and on May 9, at the privy council, Stafford, though reluctantly, voted for a dissolution The same morning the Committee of Eight of the privy council met again. Vane and others were for a mere defence against invasion. Strafford's advice was for a vigorous

osecution of war
Bill of Attainder,—The Long Parliament assembled on Nov. 1640, and Charles immediately summoned Strafford to London Under safe conduct from Charles, he arrived on the 9th and on the 10th pro-posed to the king to forestall his impeachment, now being prepared by posed to the kingt to forestall this impeachment, now being propared by the parliament, by accusing the leaders of the popular party of trea-sonable communications with the Scots. But Pym immediately took up the impeachment to the lords on the rith. Straffed came to the house to control his accusers, but was ordered to withdraw and committed whereapon he was sent to the Tower, and, on Jin 3, 7464, the ac-cusations in detail were piecented. These were, in sum, that Strafford had endeavoured to subvert the forward and on Jin 3, 7464, the ac-lant of the responsibility to the nation of the leader of its satisfiant of of the responsibility to the nation of the leader of its satisfiants of of the responsibility to the nation of the leader of its satisfiants of of the responsibility to the natuon of the leader of its administration. The commons, convinced that the destruction of Strafford was essential to the histories of the singdom, dropped the imprachment, and brought to the histories of the singdom, dropped the imprachment, and brought the library of the procedure of an impactment was practically adhered to. Strafford might still have been saved but for the kings ill-advised conduct. The administration of the strafford was practically adhered to. Strafford religious to the strafford was also been saved but for the kings ill-advised conduct. The statistical religious to the strafford was also been saved but for the kings is advised conduct. The statistical religious transfer in the straff of the strafford was also been supported by the supported by the strafford was also been supported by the suppor

Thus passed into history "the great person," as Clarendon well calls him, without doubt one of the most striking figures in the annals of England. Strafford's patriotism and ideas were fully as noble as those

of his antagomsts Like Pym, a student of Bacon's wisdom, he believed in the progress of England along the lines of natural development, but that development, in opposition to Pym, he was convinced could only proceed with the mecesse of the power of the executive, not of the paliament, with a government controlled by the lang and not by the

peopie Sträfford was martied three times (1) in 1611 to Lady Margaret Chifford, daughter of Francis, 4th earl of Cumberhand, (2) in 1625 to Lady Arabella folles, daughter of John, 1st eanl of Claret, (3) in 1631 to Elizabeth, daughter of Sir Godfery Rhodes He left three daughters and one son, Whilman, 2nd earl of Strafford

STRAITS QUESTION. The Straits Question concerns the international status of the Black Sea straits, i e, the Bosporus and the Dardanelles, which form the only existing passage from the Black sea into the Mediterranean and vice versa. In 1453 these straits became a part of Turkey and thus entered into the Eastern Ouestion (a v.) until the end of the Ottoman empire in 1920. It is not identical with the problem of Constantinople as the former capital of the Byzantine empire, although the two problems might have been connected in the past. Whatever the political aspirations of the antagonists of the Ottoman empire, including Peter the Great, there was no Straits Ouestion before 1774, for until then the Black sea was an inland Turkish sea From 1774 on, with Catherine the Great acquiring the northern shore of the Black sea, the Straits Question appeared involving the interests of Russia, Turkey and the non-Black-sea naval powers These interests do not coincide. Russia's aim has been to secure free passage for its warships through the straits but to close them to warships of non-Black-sea powers, the latter, and especially Great Britain with its imperial life line, aimed at keeping the Russian navy from entering the Aegean sea or at least at opening the straits to the war-ships of all nations. The Ottoman empire resisting both pressures saw in the control of the straits a guarantee of its independence and security, and this point of view remained that of the Turkish republic From 1947, the control of the straits by Turkey was also considered as a major guarantee of their own security by the non-Black-sea powers,

The history of the Straits Question can be divided into three

periods. (1) 1774-1840, (2) 1841-1920 and (3) after 1921. 1774-1840 .- This period begins with the Treaty of Kuchuk-Kamardji between Russia and Turkey, which maugurated an epoch of bilateral Russian-Turkish agreements as to the straits. The treaty opened the Black sea and the strats to Russian commercial anxigation, and this privilege was extended to the commercial navigation of other states by the Peace Treaty of Adrianople in 1820. Therefore the Peace Treaty of Adrianople in 1820. The Peace Treaty of South Russia, it did not conflict with the economic development of south Russia, it did not conflict with the economic interests of the non-Black-sea, powers, while Russia present of the Peace Treaty of Treaty treaty opened the Black sea and the straits to Russian commercial Britain in Turkey, the Treaty of 1833 was cancelled by the London convention of 1840 which established a rule that no non Turkish navy

might cross the straits in peacetime, the Russian navy included 1840-1920.—The London convention was the first general international convention concerning the straits, and it inaugurated a period in which they became the common concern of all Great Powers. In water they became are common concern or all treat rowers. In without modification until World War I. The prohibition of passage for warships of all nations was confirmed in 1856 (Treaty of Paris), in styr (Treaty of London) and in 1852 (Treaty of Berlin). During in styr (Treaty of London) and in 1852 (Treaty of Berlin). During regime more favourable to the passage of its winkips, but in spite of Russafa political alignment with France and England in European

affans at that time the attempt ended in a failure During World Wa: I, Turkey having fought on the side of the Central Powers, the Allied Powers agreed to the inclusion of the straits, after the war, in the Russian empire (Treaty of London, 1915) However, the leaders of the October Revolution having cancelled all the impenial leaders of the October Kevolution having cancelled all the impelial seciet freates and renounced all annexations, the problem of the strait was solved after the war differently and without the participation of Russia. The Peace Treaty of Sevices (1920) which never went into force, would have imposed on Tutkey the disarmament of the straits and their opening to all foreign warships, while the zone of the straits would have passed under the administration of an international com-

massion 2921.—The proposed segme of the Treaty of Swives was durapted by the opposition of the national Turkas government formed by Mustafa Kennal Thereafter, a forceful Turkish factor was increasingly influencing the Strats Question. In the Deginning, since the strategies of the Company of warsings should be decided by a conference of the functivesses states only (treaty of March 16, 1921). However, no such conference was held, and the regime of the straits was finally decided with the participation of the western powers at Laussane (convention of July 24, 1921). The convention of Laussane maintained the demilitarization of the straits and the freedom of passage for warships "under any banner", also the International Commission of the Straits was maintained under the chairmanship of Turkey—a concession among others, to Turkey The convention included a clause that no naval force larger than the largest Black sea fleet (se that of Soviet Russia) might be sent in peacetime into the Black sea by a non-Black-sea state

Because this arrangement satisfied neither Turkey nor Soviet Russia, it was revised at Montreux in 1936, when a new international situation resulting from a more aggressive German and Italian policy made it appear dangerous also to Great Britain and France The Montreux conference re-established the full right of Turkey to fortify the strauts and disbanded the International commission Reaffirming the already traditional freedom of navigation for commercial ships of all nations, the Montreux convention agreed to differentiate between the warships of Black-sea states and those of non-Black-sea states, giving to the former privileges the latter did not receive. With the exception of air-craft carriers and submarines all warships of Black-sea states were alcrait carriers and summarines an warsings of Black-sea states were allowed to close the statist unrestrictedly in peacetime, only light warsings of non-Black-sea states had this right under limitation of tonange, number of units simultaneously present and duration of cruising time. In time of war, the struts would be closed to all participants in the conflict, if Turkey was neutral

The Montreux convention was scheduled for revision in 1956. In 1945, at Potsdam, it was decided that each of the Big Three would communicate its views directly to Turkey concerning this revision, but communicate its views directly to Turkey concerning this revision, but the USSR, having raised demands for joint control of the straits with Turkey, Great Britam and USA backed Turkey in rejecting these demands as inconsistent with its independence and endangeting its security. On May 30, 1953 the USSR, withdrew its demands of

1046.

### STRAITS SETTLEMENTS: SEE MALAYA

STRALSUND, a scaport, formerly in the Prussian province of Pomerania, and after 1945 in Mecklenburg, N. Germany, on the Baltic strait of Bodden, opposite Rugen island; it lies 135 mi, by rail N of Berlin.

Stralsund was founded early in the 13th century and, though several times destroyed, steadily prospered. It extorted from King Eric of Norway a favourable commercial treaty in 1284-85; and in the 14th century it was second only to Lubeck in the Hanseatic League. Its early Protestant sympathies placed it on the side of Sweden during the Thirty Years' War, and in 1648 it successfully resisted a siege of eleven weeks by Albrecht von Wallenstein. Under the Treaty of Westphalia (1648) Stralsund was ceded with the rest of Western Pomerania to Sweden; and for more than a century and a half it was exposed to attack and capture. It was taken by France in 1807, by Denmark in 1814, and in 1815 it passed to Prussia. In 1045 Stralsund was taken by Soviet troops.

STRAMONIUM, in medicine, a drug obtained from the leaves and seeds of the Datura stramonium (Jamestown, Jimpson or Jimson weed). Both contain atropine and other closely related alkaloids. The physiological action of stramonium resembles that of belladonna (see ATRORINE). It is chiefly used in asthma to relieve the bronchial spasm Cigarettes made of stramonium leaves may be smoked or the tincture may be taken internally.

STRANG, WILLIAM (1859-1921), British engraver and painter, was born at Dumbarton, Scotland, on Feb 13, 1859, and died at Bournemouth, Hants, on April 21, 1921 He studied at the Slade school, London, 1875-81, under Alphonse Legros (q v), whose influence is responsible for the Ostade-like grotesqueness of some of Strang's compositions, the strong reminiscence of I F Millet in others and the flavour of Anthony Van Dyck in his engraved postsaiture; Rembrandt and Whistler also helped to shape his style Strang used etching, mezzotint, drypoint and line engraving, and for the last introduced a hooked burin, intended to produce strong effects by being drawn, rather than ploughed, across the plate His portrait subjects included R L Stevenson, Tennyson, Bridges, Kipling, Thomas Hardy and George Meredith. he often made private plates for such sitters, the final-state proof being the only "original" He early made a reputation as an etcher of Biblical and imaginative subjects, illustrating The Pilgrim's Progress (1885), The Earth Fiend (Kipling, 1892), Don Quinote (1902), etc He also painted and etched landscapes, allegories and social subjects-of which last type "Salvation Army" (etching, 1889), "Socialists" (etching, 1891) and "Bank Holiday" (oil, 1912, Tate gallery, London) are noteworthy He was a foundermember of the Royal Society of Painter-Etchers, 1881, but 1esigned in 1902 over the society's accepting engraved reproductions of paintings for exhibition He was elected ARA in 1906, RA in 1021 and in 1018 had become president of the International Society of Sculptors, Painters and Gravers His work in engraving and painting (to which he gave more time in later years) is represented in the Tate gallery, the British Museum and elsewhere.

BIBLIOGRAPHY — William Strang. Catalogue of His Etched Work (Glasgow, 1906, supps 1912, 1923), F. Newbolt, Etchings of William Strang (London and New York, 1907), C. Dodgson, The Etchings of William Strang and Sir Charles Holroyd (London, 1933)

STRANGE, SIR ROBERT (1721-1792), Scottish engraver, was born at Kirkwall, Orkney, on July 14, 1721 He was apprenticed to Richard Cooper in Edinburgh Having joined the Jacobites in 1745, he engraved a portrait of the Young Pietender and banknotes for the coming régime, and fought at Prestonpans, Falkirk and Culloden. For a time an exile at Rouen and in Paris, by 1753 he had settled in London. There he made a reputation mainly with engravings after the Italian Baroque masters (especially Guido Reni), often using a mixed technique derived from the Watteau engravers, the outlines and main shading being etched in, and the plate then worked up with the burin. After quarrelling with Allan Ramsay over the engraving of some royal portraits, Strange travelled in Italy, 1760-65 Returning to London he was elected (1766) to the Incorporated Society of Artists, some of whose directors resigned in 1768 to form the Royal Academy. In 1775 Strange attacked the Royal Academy-which did not then admit engravers as full academicians-in An Enguery into the Rise and Establishment of the Royal Academy of Arts at London. In turn assailed by the press he lived in Paris until 1780, but returned to find royal favour through the good offices of Benjamin West and was knighted in 1787. He died in London on July 5. 1702. Among his book illustrations were two plates for William Hunter's Gravid Uterus (1750)

See J Dennistoun, Memors of Sir Robert Strange, Knt., and Andrew Lumisden, 2 vol. (London, 1855).

STRANRAER, a royal and small burgh and seaport of Wigtownshire, Scotland. Pop (1951) 8,622. It is situated at the head of Loch Ryan, an arm of the North channel (Irish sea), 52 mi, S.S.W. of Ayr by road. It lies 39 mi. E by N. of Larne in Co. Antrim, Northern Ireland, with which there is regular communication by mail steamer. Grain milling and nursery gardening are carried on, and there is a large trade in farm and dairy produce. Whitefish and herrings are caught and there are oyster beds at Cairn Ryan on the east side of the loch. Strangaer, originally called St. John's Chapel, became a burgh of barony in 1596 and a royal burgh in 1617. In the centre of the town are the runs of the castle of the 15th century, occupied for a time by John Graham of Claverhouse, Viscount Dundee, when he held the office of sheriff

of Galloway (1682).

Three miles east of Stranraer is Lochinch, the residence of the Chailes the Bald and Louis the German were taken there in 842, earl of Stan, a modern structure (1870) in the Scots baronial style. The grounds include the White and Black lochs, and the ruins of Castle Kennedy on the isthmus between. This castle was erected in the reign of James VI for the earls of Cassilis, passed into the hands of the Stair family in the 17th century and was burned down in 1716. The gardens, which contain the finest pinetrum in Scotland, were restored in the middle of the 19th century,

STRAP WORK, in architecture and the decorative arts, a form of ornament developed in Germany, Flanders and England during the latter half of the 16th and the 17th century and consisting of scrolls, straight lines, rectangles and shield forms carved or modelled in flat relief, often with a raised fillet at the edge, and often pierced with circular or oval holes, the whole composition is usually formed of connected units, all upon the same plane, as though made by an elaborately cut out and pierced strap applied to a background It is a development of certain Italian early Baroque motives, such as the multiple shield or cartouche frames, and certain approximations of it occurred in Italian metalwork as early as the silverwork of Benvenuto Cellini (1500-71); these forms are, themselves, Italian interpretations of the flat scrolls so common in Mohammedan metalwork Strap work was used extensively in the Renaissance woodwork of Germany and is occasionally found in stone, as in the Salzhaus at Frankfurt A M. (end of the 16th century). In Flanders and the Netherlands strap work received an even more complete development, for although in Germany it was usually only a subsidiary motive, in the architectural woodwork and furniture of the Low Countries it often became the only type of ornament used The form was introduced into England by the flood of Flemish and German woodworkers that came in in the latter part of the 16th (T F. H) and early 17th centuries.

STRASBOURG (STRASSBURG), a town of France, the capital of the department of Bas-Rhin, at the junction of the Ill and the Breusch, 2 mi W. of the Rhine, 88 mi. by rail N. from Basle. Pop. (1946) 175,515. The Ill divides into arms forming an island on which the city grew; it was long a strongly fortified place, and the removal of the fortifications immediately around the city gave opportunities of large expansion after about 1875. The old city contains the cathedral, or Munster (11th to 15th centurnes). Part of the crypt dates from 1015; the apse is Transitional; and the nave, finished in 1275, is pure Gothic. The elaborate west façade has a screen of double tracery, numerous sculptures and two towers, the northern with a tall spire The cathedral has some fine stained glass, a sculptured pulpit and the famous astronomical clock in the south transept; this contains some fragments of the clock built by the mathematician, Conrad Dasypodius, in 1574. The Protestant church of St. Thomas is a Gothic building of the 13th and 14th centuries.

The Palais de Rohan or old episcopal palace, built in 1731-41, was used for university purposes from 1872 to 1895; it is now the municipal museum of art. Other notable buildings are the Frauenhaus, with some interesting sculptures, and the Hôtel du Commerce, the finest Renaissance building in the town. The University of Strasbourg, founded in 1566 and suppressed during the French Revolution as a stronghold of German sentiment, was reopened in 1872 and again as a French institution in 1922.

The chief industries of Strasbourg are tanning, brewing, printing and the manufacture of metal goods, paper and tobacco. To these must be added the fattening of geese for Strasbourg's celebrated pâté de foie gras.

History.-Strasbourg has always been a place of great strategical importance, and as such has been strongly fortified. The pentagonal citadel constructed by Vauban in 1682-84 was destroyed during the siege of 1870. The site of the town was originally occupied as a Celtic settlement, which was captured by the Romans, who replaced it by the fortified station of Argentoratum, afterwards the headquarters of the eighth legion. In 357 the emperor Julian gained here a decisive victory over the Alamanni, who so years later re-conquered the whole of the district. Towards the end of the 5th century the town passed to the Franks, who gave it its present name. The famous "Strassburg oaths" between

and in 923, through the homage paid by the duke of Lorraine to the German king Henry I, began the connection of the town with the German kingdom which lasted for over seven centuries The early history of Strasbourg consists mainly of struggles between the bishop and the citizens. This conflict was finally decided in favour of the citizens by the battle of Oberhausbergen in 1262, and the position of a free imperial city which had been conferred upon Strasbourg by the German king, Philip of Swabia, was not again disputed. In 1332 there was an internal revolution, which admitted the guilds to a share in the government of the city.

In 1381 the city joined the Stadtebund, or league of Swabian towns, and a century later it helped the Swiss confederates at Granson and Nancy. The reformed doctrines were readily accepted in Strasbourg about 1523, and the city was skilfully piloted through the ensuing period of religious dissensions by Jacob Sturm von Sturmeck, who secured for it very favourable terms at the end of the war of the league of Schmalkalden. In the Thirty Years' War the town observed a prudent neutrality. In 1681, during a time of peace, it was suddenly seized by Louis XIV, and this unjustifiable action received formal recognition at the peace of Ryswick in 1697. At the French Revolution the city was deprived of its privileges as a free town. In the war of 1870-71 Strasbourg, with its garrison of 17,000 men, surrendered to the Germans on Sept. 28, 1871. The city and the cathedral suffered considerably from the bombardment.

The bishopric of Strasbourg existed in the days of the Merovingian kings, being probably founded in the 4th century, and embraced a large territory on both banks of the Rhine, which was afterwards diminished by the creation of the bishoprics of Spires and Basel. The bishopric was in the archdiocese of Mainz and the bishop was a prince of the empire. The episcopal lands were annexed by France in 1789 and the subsequent Roman Catholic bishops of Strasbourg discharged spiritual duties only.

Strasbourg is the seat of a bishop, of a prefect and of the departmental organization, and of the special government offices for the territories returned to France after 1918 Kehl, with a population (1939) of 12,138, on the German bank of the Rhine, opposite Strasbourg, was constituted one with the port of Strasbourg for purposes of exploitation for a period of seven years from 1919. Extensive improvement schemes were approved in 1924, including the creation of a large port above Strasbourg, connecting with the harbour by canal, and a petroleum harbour below the town.

Battle of Strasbourg (A.D. 357) .- A rising of the Sarmatians, Suevi and Quadi on the Danube compelled the Emperor Constantius to hasten there in 357. Julian, the Caesar, was at Sens with an army 13,000 strong, and as the emperor was unable to assist him he despatched Barbatio, magister pedutum and 25,000 troops to Gaul. Julian was to march north, and Barbatio to co-operate with him with Basel as his base of operations. The forces of the barbarians were to be enclosed between them.

Moving to Reims, Julian concentrated his forces. Thence he marched to Zabern. Meanwhile Barbatio who had refused to obey his orders was surprised by the Germans and driven back to Basel. Julian's position was now an extremely dangerous one; he was far distant from the emperor, and Barbatio's defeat had raised the morale of the Germans who, under the leadership of Chaodomar, crossed the Rhine and encamped on its left bank near Strasbourg. Undaunted by this mishap Julian set out from Zabern to meet the horde, which was some 35,000 strong. The Romans marched in close order and in two columns, the cavalry on the right and the infantry on the left, and as evening was approaching Julian was desirous of deferring the battle until the following day. His men, in spite of the heat and the long march, urged him to lead them on. This Julian agreed to, and took command of the right wing consisting of heavy cavalry and archers. This wing coming into contact with the barbarians was fiercely charged by light horse and driven back. A panic was only stayed by the Caesar riding among his men and exhorting them to rally. The brunt of the attack was borne by the Roman centre and the left, and it was a struggle of footmen against footmen. In spite of the valour of the barbarians, the discipline of the Roman intantry carried one year rarely contained members of the previous Boule, the the day, the Germans being driven into the Rhine where large numbers perished, 6.000 dead were also left on the field. Chnodomar was captured and sent a prisoner to Constantius

This victory resulted in the recovery of the upper Rhine, and the freeing of Gaul from barbarian invasions

STRATA-FLORIDA (Ystradflur), the runs of a Cistercian abbey of Cardiganshine, Wales, near the river Testi, 2 m from the village of Pontrhydfendigaid (bridge of the blessed tord) on the Testi Excavations have brought to light encaustic tiles The elaborate western portal is a fine specimen of transitional Norman-Irish 12th century architecture A silver seal of the

abbey is in the British Museum Founded and endowed in 1164 by Rhys ap Griffith, prince of South Wales, the Cistercian abbey of St. Mary (which was probably a revival of an older monastic house on or near the same site) was much favoured by Welsh bards, nobles and princes In 1138 Llewelyn ap Iorwerth, "the Great," summoned his vassals to this spot to do homage to his heir, Prince David II The abbey suffered severely during the Edwardian wars, and in or about 1294 a large portion of its build-

STRATEGUS, strictly a general, but frequently the name of a state officer with much wider functions (στρατηγός) found in many Greek states The best known is the Athenian strategus, originally a military official, who, in the latter half of the 5th century B.C., became the most important executive magistrate in the state: it is certain that until the end of the 6th century the archon (q.v.) was the most important state official The Strategia (board of ten generals) was a result of the tribal system of Cleisthenes Some maintain that Cleisthenes himself created it, but the evidence (Ath Pol. xxii.) is against this At all events, as late as the battle of Marathon the head of the army was the polemarch (See Archon ) It follows that the strategus was, until 487 B C subordinate to the polemarch, the story of successive days of command in Herodotus being due to a misunderstanding of the powers of the strategi at the time (cf. G B. Grundy, The Great Persian War). The tribal unit was represented in the army by the taxis, and each taxis was led by a strategus After the Persian wars the command of the taxis passed to officers called taxiarchs, who acted as colonels under the strategi. It was the customary practice in the 5th century to appoint a certain number of the generals, usually three or five, for a particular field of operations, and to assign the chief command to one of them. Exceptions to this rule are found in the well-known instances of the Sicilian expedition (when the three commanders, Nicias, Alcibiades and Lamachus were given co-ordinate powers), and the battle of Arginusae, when the command was divided among the whole board. In crises such as the Samian revolt, the outbreak of the Peloponnesian War, or that which led to the recall of Alcibiades. we find the whole board subordinated to a single member (e.g., Pericles or Alcibiades). Originally each strategus was elected by and out of the tribe he commanded (Ath Pol. lxi.) In the 4th century, however, the strategi were elected out of all the citizen body irrespective of tribes; in 433, one of Pericles' colleagues was Diotimus, a member of his own tribe (cf. Alcibiades and Adesmantus in 408 B C.). But from Xenophon (Memorab. iii. 4) we learn that one strategus was still elected by each tribe, ie., each strategus represented a tribe, though he might not be a member Though the strategi were the nominal heads of the army. they had no power to choose their taxiarchs, who were elected by the tribes. It was only the lockagoi (commanders of λόχοι, companies) that the Ecclesia allowed them to select.

In the course of the 5th century the powers of the strategia were increased by important political functions, especially in toreign affairs; hence the office unlike that of the archon (q.v.), remained elective and was held by the most important men (e.g.remained elective and was need by one most important mean tog-pericles, Nicles, Alchisides). As the Boulé was the chief admini-tifative body, it was necessary to bring the strategi into close con-nection with it; though not members, they were allowed to attend its meetings and to bring motions before it. As the Boule of

strategi acquired great power from the fact that they were frequently re-elected for many years together, and so had greater experience and continuity of policy In the Ecclesia, the strategus business took precedence (the meetings always discussed first the question of national defence), and he could, in cases of emergency, convene a special meeting (of Thuc ii. 50 and iv 118)

The strategia was by no means analogous to the British cabinet which has collective responsibility and whose members are heads of state departments The strategi had no collective responsibility, άκτήν, κ. τ. λ.) dates from the 4th century Without being actually a foreign office, they acted on undiquara of the Ecclesia in negotiating and concluding treaties and alliances Their real power was mainly due to two considerations They were elected, when other great officials were chosen by lot and thus were picked men approved by the Ecclesia. They were capable of re-election and a man who commanded the confidence of the people was often re-elected (e g , Pericles) Such magistrates gained wide administrative experience and enjoying the confidence of the Ecclesia were able to dominate their colleagues and the state (λόγω μέν δημοκρατία ξργω δέ τοῦ πρώτου άνδρὸς άρχή). It was to this personal ascendancy and hold over the Ecclesia rather than to the constitutional authority of his office that the power of the great strategus was due

STRATEGY. In a strictly military sense, the term means "the art of the general" (Greek strategos). Its meaning has changed with the social shifts among people, particularly in western civilization. During the 19th century, the term was expanded for use in the sphere of national policy, particularly in time of war, when the conduct of strategy demanded not only military adaptations, but also political, economic, psychological, technological and moral adjustments. The demarcation between military and national strategy is not, and cannot be, clear-cut since a decision in the military field may have a consequent result on the nation's strategy. Conversely, a revision in national policy may require military leaders to revise their strategy Accordingly, political leaders must understand multary strategy and military leaders diplomatic commitments.

Strategy is an art that concerns men and science It is never stationary, since the means of applying it are ever varying great captains of history-Alexander, Caesar, Jenghiz Khan, Gustavus Adolphus, Frederick the Great and Napoleon-understood the fine cohesion of military and national strategy because each was in his person the leader of both the state and the army.

#### STRATEGIC THEORY

Development of the Meaning .- Strategy as a term did not appear in literature until the latter part of the 18th century. The need for an inclusive word was becoming more apparent as the great wars of the 17th and 18th centuries and increasing attention to military matters evoked considerable comment upon the conduct of war. Frederick the Great, Maurice de Saxe, Louvois, Vauban, Guibert and many others wrote their observations on the aspects of war. Drill, training, discipline, supply, conduct of sieges and the organization of armies were the subjects most often discussed. Much less was said about strategy. Furthermore, none of these writers, except Frederick, concerned himself with strategy. Baron Jomini and Karl von Clausewitz, the chroniclers of Napoleon's battle strategy, were undoubtedly the first great students of strategy.

Possibly Machiavelli was the real forerunner of thinkers on the larger aspects of war and the methods of conducting it. His Art of War distinctly recognized for the first time the interlocking character of the civil and military spheres in time of war. Though not a military leader or a member of the military profession, he thought in terms of the necessity of considering military action in the accomplishment of the aims set forth for his state.

strategy into effect Before his time, strategy, whether called by that term or unnamed, was the art and science of directing military forces in time of war so as to defeat an enemy-or, in its negative aspect, to mitigate the results of defeat. The negative approach to strategy has been exhibited throughout history by commanders with inferior forces-like Fabius, Maurice of Nassau and Frederick the Great-who avoided pitched battles in an effort to exhaust the enemy and bring about a peace

In Napoleon's time, the strategy of the battlefield-the narrow definition above-was retained But added to it was the strategy of victory, which encompassed his political and economic moves to increase the chances of victory in the wars. Many writers concluded that this new development was a natural course of events and one that emphasized the social nature of warfare and therefore of strategy. Both Napoleon and Frederick the Great, as noted above, combined the offices of military commander and leader of the state Their decisions on the battlefield or in the councils of state were complementary. There could be no disassociation of the national policy and military strategic objectives

After the time of Napoleon, the American Civil War of the 19th century and the two great World Wars of the first half of the 20th increased emphasis on the larger aspect of strategy A new definition, to meet the broadened view of the conduct of war, was expressed by Maj Gen Su Frederick Maurice (British Strategy, Constable and Company, Ltd , London, 1929) as "the art of applying national power to achieve the object of war."

Relation to National Objectives and Policy .-- Modern nations have traditional and established objectives, sometimes assumed rather than written. The universal and primary objective of security was expanded in the course of two or three centuries from that of territory alone to include security of interests in the political, economic and psychological fields. Another objective is the nation's right to its livelihood. This has application in the access to trade and markets and in the desire to improve the standard of living of the citizens. Another objective is the spread of an ideology or faith.

National objectives influence the phrasing of national policies. both in the domestic and foreign fields. Conceivably, the objective of security underlies the expression of both these elements of

The methods of accomplishing policy goals form what might be called a national strategy, particularly as it pertains to war. However, in the terminology of the "cold war," with no overt military conflict, the term strategy was employed to designate the summation and direction of manoeuvres in such differing fields as the political and technological. Here is the real difficulty in the meaning of the term strategy. Ever present is the question of whether strategy refers to the positioning of armed forces in time of war; or the composite manoeuvre of a government in every sphere of endeavour, in time of war, or other period of international tension, in order to carry out its national objectives

If the term strategy is to retain any meaning, it is evident that it should be confined to the preparations for and conduct of war. It should also differentiate, as far as possible, between the military and civil power of a state by the designations military strategy and national strategy. Henceforth in this text, the reference to strategy, except in historical examples prior to Napoleon, is to the broader perspective of wartime utilization of all resources in order to achieve national objectives.

Aims of Strategy.-Defeat of the enemy forces has always been the aim of strategy in time of war. In ancient and mediaeval times, as well as in the early modern era, victory on the battlefield often meant the winning of a war and the accomplishment of the nation's objectives. When Scipio defeated Hannibal at Zama (in Tunisia), he assured victory for Rome over Carthage. When Ulysses and his Greek force made a landing and attacked the city of Troy, their sacking of the city and killing of its inhabitants was the closing act in the early war between Greece and Troy.

Throughout history, this aim of strategy has been accepted as valid. No exception, up to and including the defeat of the axis

Napoleon was the first great leader to put the new meaning of powers by the Allied powers in 1945, appeared in what is practically a law of warfare In the long history of conflict, land and sea forces have consistently brought wars to conclusion through the strategic defeat of the enemy's armed forces With a few exceptions, sea power alone has not been sufficient to bring about the accomplishment of this aim of strategy Rather it was the land forces which seized and held ground, and eventually defeated enemy land forces, which brought about the desired goal. Naval strategy, however, assumed importance in modern times and exerted a vital influence on the strategy of war

The introduction of the new dimension, the air, as well as the industrial nature of modern technological warfare, gave great impetus to a second aim of strategy. It is expressed in the phrase "to strike at the heart of the enemy." The heart of the enemy is undeniably its industrial strength or war-making potential Admittedly, too, the thrust was not within the capabilities of a land and sea force until it had overcome the numerous barriers, physical, natural and human, which had been established by an adversary for its security. Accordingly, air power offered the ability to hop over barriers and to strike with bombs against the industrial heart.

Even before this second aim of strategy had been put to trial in warfare, exponents appeared who were positive that the first aim was no longer an essential to strategy Some exponents compromised with the first aim, suggesting that it be revised to the extent of engaging the enemy's land and sea forces But they averred that the will of an opponent would be broken by aerial bombing of his wai-making power. The land and sea forces, as well as the air forces, of an enemy would wither on the vine The "strategy of exhaustion" of early writers would be accomplished not by the land and sea forces, but by the air forces and their strikes against the industrial core of an opponent.

World War II partially tested this thesis that the sole aim of strategy was to support the air forces to the end of annihilation of the enemy's industrial capacity. The evidence at mid-20th century was still unconvincing to adherents of both the new and the old ideas of strategy The an enthusiasts claimed they had not developed aircraft and bombs to the necessary capacity, while the land and sea disciples countered that it was ground and naval forces-in combination with the air forces-which made victory possible by defeating the enemy's armed forces.

The controversy was still further joined when the first atomic bomb was dropped by aircraft on Hiroshima, Japan, on Aug. 6, 1945. Here was a revolutionary weapon, some air strategists contended, which would make unnecessary the defeat on the battlefield of an enemy's armed forces, if dropped by aircraft on vital industrial centres of an aggressor

In the realm of strategy, this controversy underlay the postwar endeavour to unify the land, sea and an forces of the United States. Modern technology, in its revolutionary scientific contributions to warfare, had added another factor in considerations of strategy If the second aim of strategy-the breaking of an enemy's will to resist by the crippling of its industrial powerwas conceivably the sole valid consideration in national strategy, then the military strategy of combined land, sea and air forces to defeat an enemy's armed forces was no longer an overriding goal.

Technology was adding other new weapons, such as guided missiles and biological and radiological weapons, as potential armaments. The student of military history, however, had an understandable hesitancy in accepting the theory that new weapons would radically alter the strategy of warfare, as had been concluded with the introduction of gunpowder and the aeroplane These matters were in the realm of prophecy and should logically follow a detailed examination of such questions as, what strategy seeks to accomplish; how it is made effective; the restrictions of time and space, the expansion into three dimensions; and the like

Strategic Concept.-Regardless of whether strategy is national in scope or confined to the military sphere, it must have direction. This compass point, or intent, is known as the strategic concept. British strategy in the Napoleonic Wars was generally to seal off the continent with naval power, while carrying on a war of exhaustion on land through the medium of peripheral actions, such as Wellington's highly regarded Iberian Peninsular

campaign. In World War I, the strategic intent to blockade Ger- which the commander chooses to fight may exhibit certain charmany by naval power was augmented by the land campaign to meet the enemy forces head-on in a death struggle.

Strategic concepts underwent a great inflation in the global warfare of World Wai II The first decision which had to be made was in regard to where strength would be concentrated, in Europe or in Asia Obviously, the decision of the Allied powers was to place the primary emphasis on the successful resolution of the war in the Atlantic area.

Strategy must accordingly take into account the intent of its makers, because otherwise man power and materials might be dissipated uneconomically To the definition of national strategy the word "efficient" should be added so that it will state: The art of efficient application of national resources to the accomplishment of national objectives

On a lesser canvas the military commander of an overseas area in World War II likewise had a strategic concept to define his intentions in a subordinate theatre of war Of concern to him were the necessities of utilizing his means to effect the aims of strategy, both of defeating the enemy forces and of striking at the heart of the enemy Relatively early in a campaign, the strategy of pounding the enemy's industrial centres was possible through the air, while land and sea forces in co-operation with the air forces were pointed in that direction, at the same time accomplishing their primary objective of defeating the enemy's armed forces

Accomplishment of Strategy.-In the era of total warfare, once national strategy is formulated, its accomplishment requires the entire efforts of the whole society To make national strategy effective, nonmilitary endeavours must be considered and funnelled into the total effort. Increases in industrial production, the technological development of new weapons, a successful psychological attack upon an enemy people, the betterment of the home people's morale-all these and dozons of other endeavours become a natural part of national strategy, to be augmented by the military strategy of the battlefield. Policies and plans, in every phase of society, must be so integrated that victory, the national strategic aim, is accomplished.

Historically, success in military strategy has been the result of adherence to certain principles of warfare Though there is no complete agreement as to their number, these principles generally include: economy of force, surprise, the objective, the offensive, mass, movement, security, simplicity and co-operation authorities maintain that a number of these are methods, but despite debate over terminology, most multary students accept them as principles. However, it is possible that the principle of simplicity could be eliminated since it obviously underlies all others, and conceivably a principle of concentration could be substituted for the principles of objective and mass.

These traditional principles of warfare emphasize its social character, and all of them can be translated substantially into the accomplishment of national strategy. Economy of effort in the economic field, co-operation in the political field, the creation of new weapons as a surprise to an enemy, all lend themselves to the development of an effective national strategy,

These principles refer to the effecting of a general plan of military operations, which is the method of achieving the strategic goal of breaking the enemy's will to resist.

The problem confronting the military strategist is to utilize his fighting strength against an enemy. Of major importance is the directive from his superious, the leaders of the state. From these instructions the task takes form. The way in which the commander accomplishes his task is in the province of the fighting

Strategic aims are set forth for the commander but they do not explain how to draw up his plans, nor do they set forth the situation. The commander's task is to interpret the situation, both as regards his own forces and those of the enemy. He must take into account the factors of space and time and he must judge the possible reactions of the opposing commander. As Clausewitz said, matters of strategy are simple, but not necessarily easy There are many imponderables. The nature and strength of the enemy's fighting forces cannot be exactly known; the terrain on

acteristics not considered of major importance in the planning stage

Putting a strategic plan into operation is an extremely hazardous move Gen Dwight D Essenhower told of his fears, after all was prepared for the gigantic Albed landing in Normandy in Tune 1944, when his weather forecasters informed him of the unexpected and unseasonal strong winds and overcast skies in the Enghish channel After a one-day postponement, and despite the fact that weather was still unfavourable, Eisenhower gave the command to move Diplomatic commitments hung over his head, as well as the purely military consideration that a two-week wait for the favourable full moon might divulge the time and place of his main effort.

Time and movement are in the province of strategy, as well as combat and space In World War II, considerations of time and space were enhanced in importance because of machine warfare Three-dimensional warfare also added to the complications of bringing together a fighting force ready at a fixed time to move against an enemy-held area

Time and space considerations in bringing the mass of man power, machines and materials together in the Normandy landing were a definite part of military strategy As in the days of ground warfare, this was the modern counterpart of the positioning of the forces for the day of battle

The principles of war have been immutable since ancient times. The turn to the offensive, the concentration of force, the effort to gain suiprise, the movement of forces, their security from enemy attack or from sabotage or subversion-all are in the province of modern as well as ancient warfare Once the forces are brought to bear against the enemy there is still the need for military strategy by the high commander, but each subordinate will have his individual battle in the over-all panorama of war and his methods of fighting are known as tactics.

Relation Between Strategy and Tactics.-Tactics (q v.) pertain to land, sea and air forces where they concern the disposing and manoeuvring of forces on the field of battle They may relate to the actions of small bodies or to the combination of many arms on the battlefield. Prior to World War II, tactics usually referred to the combination of infantry and artillery in their fire and movement on a battleground In World War II, however, sea and air forces were brought into the tactical combination on the battlefield. For instance, the air support of fighter planes in "tank busting," the use of naval gunfire from the sea to help reduce strong points held by enemy battalions or regiments, were examples of the enlarged scope of tactics.

At what point tactics become strategy is difficult to determine When the fighting force was larger than a division, as was common in World War II, the army or army group commander placed his troops in battle positions in a manner comparable to that of commanders of history, whose sole strength was ground forces oftentimes far fewer in number than those of World War II army commanders

Superior to these battlefield tacticians were theatre commanders whose strategic efforts took in not only the purely military fighting forces of land, sea and air, but impinged upon the political and economic arena. The theatre commanders dealt with political situations on the ground after reference to the leaders of the state. but it was they who frequently had a considerable influence in the decision since they had on-the-spot information.

Strategy and tactics, as terms for manipulations of warfare, had undergone great transmutation The canvas had become much larger, the means much greater, and the methods of using fighting strength complicated by modern technology. However, there was still strong evidence to support the contention that strategy and the principles of war utilized in past wars should be studied for their future use. While it was true that conditions had changed. that the nature of warfare was undergoing vast alterations, the art itself remained unchanging. The fundamental truths, as in architecture and music, were still present to guide further study of war and strategy For that reason it is essential to survey briefly the history of war and the strategic examples of the past. Factors of Military Strategy.—Six Edward Hamley m his The Operations of War examined the various permutations and combinations of strategic manoeuvre. He emphasized that when meeting an enemy, the object is to take an advantageous position. This may be accomplished by one of the following manoeuvres (i) threat or attack against the enemy's communications with hasbs, (2) disruption of the co-ordinated action of his army "by breaking the communications which connect the parts", and (3) concentation of superior forces at vulnerable point.

The territory of a belligerent from which it draws its supplies and recruits is the base of an army. The front of any army is the line along which it is deployed. The communications or lines of communications are the routes along which an army is supplied.

The lines lead from the base to the front

With these factors in mund it is possible to turn to consideration of the strategic examples of history, realizing always, that a nation's strategy was a function of its geographic position, the temper of its people and the paticular skill or aptitude of a people for land or sea warfare. In fact, the considerations natural to a people influenced the making of strategy, and therefore at different times in history were responsible for variations in the art of strategy.

#### STRATEGIC PRACTICE

Alexander, Hannibal and Caesar—Tactical art was the lexystone of the battles of ancient times. Alexander the Great planned to carry out his designs on Persa so as to hiberate the Greek colomes in Asa Minor, a shad been envisaged by his father, Philip. After the latter's death in 336 sc, Alexander embarked on a strategic conquest of greater scope than any known before his day. With an army of 30,000 in 333 sc he was in Chica on a southward march into Syrua, along the eastern shores of the Mediterranean Because of a misjudgment he permitted Darnus to cut across his hie of communications at Issus, a strateger immoneries which might well have brought disaster to Alexander. Returning northward, Alexander sought to avert his danger Mennevhile, and the sea

Alexander lined up his army with the 16-man-deep phalanx in the centre, Macedonian cavality on the left and Greek cavality on the right. Personally in charge of the latter, he assaulted the Persian left, turned it and then made a wheeling movement against the Persian centre Darus fled, his army wildly follow-

mg his example.

Alexander continued to concentrate his relatively small force agunst the Petsians, but with due regard for the safety of his line of communications. After a victory at Tyre near Jerusalem following a seven-month siege, he moved eastward across the Tigrist of Arbela, north of Babylon With an army of 40,000, composed of the same elements as at Issus, he defeated by perfect tactics Darlus' host, estimated at 1,000,000 men and a number of elephants.

The Punic Wars between Rome and Carthage included a succession of tactical battles against a strategic backdrop. Both nations were fighting for trade supremacy in the western Mediterranean. As the wars continued, Rome developed a navy superior to that of Carthage, compelling the Carthaginians to utilize a long supply line through Spain and southern France and into northern Italy. This strategic advantage, won by the Roman navy, was vital after Hannibal practically destroyed the Roman legions at Cannae in what is considered the tactical masterpiece of ancient times Though urged to march on Rome, Hannibal understood that in enemy country, without allies, and at the end of a long supply line, he was in no position to engage in a war of attrition. Meanwhile, Fabius fended off the Carthaginians with the tactics of small battles and alert defensive manoeuvres which gave his name to such tactics However, most importantly, he defended Rome until it could recruit and train new forces.

Later, in 207 BC., Hasdrubal marched from Spain to join his brother, Hannibal. The Romans, having intercepted Hasdrubal's messenger with his plans, were able to defeat him before the

Factors of Military Strategy.—Sir Edward Hamley in his juncture in one of the world's decisive battles, Metaurus Suche Operations of War examined the various permutations and coses had attended the Roman strategy of preventing the Carthambinations of strategic manoeurer He emphasized that when main concentration of forces

A few years later, after Scipio had retaken Spain, be carned the war to Africa Rome's am was the annihalation of Carthage Aften the cleaning of Carthagnain forces from Europe, Scipio carried the war to Zama in Tunisia where he defeated Haaniha from whom he had learned the art of war After this last act of the Second Puruc War, Rome effected its strategy of annihilation as the closurs scene of the Third Pumc War

From a strategic standpoint, the Gallic Wais of Caesar illustrated the axiom that the best defense is the attack. Rome needed no fortifications or other defenses when it was causying the wais to the territory of its enemies. Caesar fought for Rome successfully, oblighying a mastery of tactics and of statemanship. He was ever careful no matter where he was fighting to maintain a secure line of communications and to concentrate forces on

ground of his own selection

The Middle Ages.—The Roman empire in its decine and fall was swept he fore the invading barbarians—the Huns, Visigaths and Goths These nomadic cavalrymen, at home in the saddle and able to live off the country, defeated the Roman forces which had become enervated by lethargy, soft living and life in the far reaches of the empire where they lost touch with their homeland. Their were no great evidences of strategy in the excursions of the Huns, or of the Mohammedian a few centures later, or in the crusades. The armed cavalrymen of the feedal age entered battle on their mounts and utilized the mobility of cavalry to catch their opponents off guard. The battles, often of short duration, were funous onslaughts of mounted men, oftentimes against the foot solder. Their tactics employed the shock action of cavalry, in sweeping asset opposition.

Of far greater moment from the standpoint of strategy were the campages of Jenghus Khan and his general Sabutat. Jenghus Khan swept across all of the vast area of Asas from Mongolia, and at one tune, in the first half of the right century, held temous sway over more than half the then-known world. His hardy cavalury lived off the country and fourth more for the exhibitation

of battle than for any gain or control of territory

Probably in all the centuries between the Roman republic and the Thirty Years' War in Europe, there is no better example of appreciation of strategy than that of Sabutas. After subduing Russia, Sabutai moved against Hungary, the last remnant of Turco-Mongols outside the domination of Tenghiz Khan's successors With three armies moving against Gran, the capital of Hungary. Sabutar executed the strategic manoeuvre of protecting his flanks by sending one army against the Germans While they were conquering the forces sent against them, Sabutai moved his two remaining armies by different routes against Gran All of them followed a prearranged schedule, arriving simultaneously, after marching about 200 mi in three days. From behind the Danube, the Hungarian army showed no inclination to fight. So Sabutai lured them out with a slow-paced, feigned retreat to Munkacz, Six days later when the river Sa io separated the opposing forces. Sabutai forded the stream and struck the Hungarians in the flank and rear, killing 70,000 of the 100,000-man army.

The attention to security of his own line of communications, the capacity for concentrating his forces, his surprise and his devastating offensive at the time and place desired marked Sabutai as

a master military strategist.

Gustavus Adolphus and Frederick the Great.—The decline of feudalism, introduction of gunpowder, the erection of fortifications, the beginnings of discipline and the organization of armies into units—all these brought about changes in the nature of warfare.

Though Gustavus is better known for his influence on modern tactics, he exhibited ability as a strategist when in one sweeping campaign he drove the imperaal amnes out of northern Germany In his campaign he fought two memorable buttles at Breitand and Litzen, defeating the two great imperial generals, Tilly and Wallenstein.

In the Seven Years' War, 1756-63, Frederick the Great gave the

first midication of the combination of military and national structure eagy. Faced by a coalition of Austria, France, Russia, Sweden and Saxony, and with a single ally, England, Frederick was compelled to fight from his central position, marching first against one enemy, then against another. In his secret instructions to his geneials, Frederick stated "Our wars must be short and quick, since it is not in our interest to drag them out. One long war would dimman our admirable discipline, depopulate our country, and drain our resources. You will force the enemy to give battle when you come upon him by a forced march that puts you in his rear and cuts his communications or when you threaten a city which it is in his interest to hold."

Consistently, Frederick used his central position on interior lines to concentrate against individual armses of the enemy. His battlefield tactics were generally sound, being based upon the oblique order of the Greek general Epaminondas. However, none of his battles were deathblows. Always, it appeared that hike an angry insect he flew here and there, but never successfully conquered one enemy. Such pinciples of war as the offensive, surpress, mobility and economy of force were well illustrated by Frederick. But from the broad strategic view, his war left his nation exhausted, and accomplished only the cession of Stlessi.

In that era of dynastic wars, there were few great contributions to strategy. Mest effort was placed on administration and many of the battles were fought in the vicinity of fortresses used as based to Sustavus, Mariborough, Frederick and others carried the fight to the enemy, in realization of the first aim of strategy—that of defeating the enemy's armed forces. It remained, however, for the commanders of the Napoleonie era, when dynasties were replaced by national armses, to bring about a significant development of modern strategy.

Napoleonic Wars.—The long war of the French Revolution and the Napoleonic era witnessed the greatest change in the methods of fighting. The nation in arms was decreed by the convention in 1793, calling upon all Frenchmen for service in the armse suntil the enemies were defeated. In 1796 when Napoleon Bonaparte emerged from the Rengin of Terori, he had at his disposal new means and methods of warfare, ripe for his use both tactically and strategically.

The new French armies were armed with a moral force new in the history of conflict. Imbued with a spurt of crusade, they made excellent soldiers. Every man was inducted for four years at the age of 20 but Napoleon induced the veterans to remind with him in the warfare on the continent. Fortunately for him, his predecessors had already introduced many movations. The duc de Broglie had created the divisional organization, the two Du Teils and Jean Gribeauval the lightweight artillery of greater range and firing power which accompanied the troops, staffs had been trained and officers were promoted by mert. Skirnish stactus, or the loose formation, were taken from the Americans' experience in their Revolutionary War.

Napoleon took this army into Italy in 1796-97 where he showed a genus for bringing a mass to bear upon the flanks of the enemy in battle after battle. Again and again his positioning of his forces on the battlefield and his strategic selection of battlegrounds davantageous to his forces gave him his name for military genius.

In the larger national strategy, the campaigns of the Najoleonic Wars were fought against a coalition of all Europe. The British naval blockade of the continent was met un part by the continently system of prohibiting British goods from entering. But this in turn brought Najoleon to his downfall, since he was needed everywhere at once to hold the coast lines, fight in Spain, in Holland, against Austria and Russia. Najoleon in one sense was a paradox. As a military leader he was unparalleled, utilizing military tractics and strategy with more completence than any leader in history. At the same time, he was unable to comprehend the national policy and strategy of Phintian and its slikes which placed him in a visellike grip. His French veteran man power became dissipated, compelling reliance on impressed nationalities of all Europe.

"Two great writers on war, Antoine Jomini and Karl von Clausewitz, interpreted Napoleon's strategic sense on the battlefield, showing how he had utilized the principles of war to his advantage. Surprise, mobility, concentration of force, both on the battlefield and in his campaigns, economy of force and all the other principles were well illustrated by Napoleon IIIs tactics and strategy influenced military leaders for a century On the Cvul War battlefields in the United States, his maxims were in the knapsack of every leading general

American Civil War.—Industrial power and railroads were of vital importance in the strategy of the Coul. War, fought in an area r, noo mit in length and 700 mi. in width. In this combat area, equal to the size of all western Europe, the opposing forces engaged in a war of manoeuvie. There was little formulated grand strategy for the war which directed the cohesion of widely scattered forces and the war industries which fed them munitions. Emphass was more upon local strategy and tactics.

While the Confederate states pursued the single aim of defeating the Federal forces on battlegrounds, often of their own selection, the north effected certain long-range policies A naval blockade was clamped on the entire south and though it was run successfully by specially fitted, fast ships, insufficient materials were brought in to save the Confederacy In the west, the Federal campaign to gain complete control of the vital Mississippi river artery was successful midway in the war when Vicksburg fell in 1863 As a consequence, the Confederacy was deprived of supplies and reinforcements from west of the river Subsequent strategic goals were the defeat of the enemy forces protecting the southern capital at Richmond, Va., and the "march to the sea" through Georgia to cut off supplies for the principal Confederate forces operating in Virginia As a further development of the Federal strategy, conscription provided the requisite man power for the military operations and the partial mobilization of industry and of the railroads evidenced the intent of applying Federal resources to attain victory

On the battlefields, military strategy was more effectively accomplished by the southern leaders, particularly Gen. Robert E. Lee and Gen Thomas J. Jackson 'The principles of war were well exemplified by these leaders, who most often outmanocurved and outguessed the northern generals with their larger armies. Stone-wall Jackson' 'Toot cavalry' ullustrated the principle of surprise in a number of battles, utilizing their mobility to strike northern forces of greater strength unexpectedly. Ecomomy of force, concentration, mobility and the offensive were principles of war at his ready command.

A dramatic climax of the war came on July 4, 1863, when Gen. U. S. Grant captured Vicksburg from the southern forces, while the Confederate General Lee was thrown back at Gettysburg, the lugh-water mark of the southern military effort. For almost two additional years, the Confederate forces attempted to prevent inevitable defeat by Federal forces which sought to bring them to buy in their home country along the Atlantic seaboard

War weariness by the north even then came near to depriving the military forces of the victory which they were slowly developing. Grant had failed to crush the Confederate armies at the Wilderness and Cold Barbor during the immediate pre-election months. But meanwhile, Gen William T. Sherman had struck to the southesst against the south's supply base at Atlanta, Gapturing it in September. His campaign was a strategic masterpiece, even though he cut himself off from his sole railtioad supply him for a 'time 'On numerous occasions, the Confederate forces on the strategic defensive were drawn into costly and vain attacks. Moreover, they were defeated separately by Sherman's strategy of menacing two cities. He feinted against one objective, then attacked the other

During Nov. and Dec. 1864, Sherman cut himself off allogether from his supply line, executing his famous march to the sea. By this manoeuvre, he captured the south's chief remaining ports and prevented supplies from going northward to Lee's army. In the spring Richmond surrendered, and Lee's army gave up before the frontal pressure of Grant a week later at Appomattox.

World War I.—The long years of tension between France and Germany following the war in 1870 culminated in a world conflict in 1914. France was supported by its allies of the Triple entente, Britain and Italy, and by Russia. Germany, as the leading nation

of the Central Powers, was assisted by Austria-Hungary. Intervening wais, like the South African and Russo-Japanese, had exhibited the tremendous fire power of the newly developed machine gun Against its great defensive power armies had been compelled to disperse on the battlefield, utilizing entrenchments and cover for protection Despite this battle experience, French and German military leaders were convinced that new weapons and new methods of control, the radio and telephone, improved the offensive capabilities of their mass armies

The strategy of World War I was largely determined by new developments arising during the period 1870-1014 Increased fire power in the machine gun, universal liability which made every able-bodied male citizen a soldier, rapid mobilization of reserve army units and the increased potential of fortifications made their impression on the minds of military leaders and upon their plans.

Before the long-expected war broke in Aug 1914, the German plans for a wide envelopment through the Low Countries into northeastern France had been prepared by Count Alfred you Schleffen Confronted by the possibility of a two-front war, against France and Britain in the west and Russia in the east, he planned to strike France first in an anticipated six-week campaign of annihilation Successful on the western front, the German armies were then to be swung against the Russians on the eastern front Schlieffen's envelopment through the Low Countries was rationalized as necessary Otherwise, how else were the German forces to prevent a long-drawn campaign against the French forts extending from Luxembourg to Switzerland, or in fighting through the Ardennes forest? Another great advantage of the Schlieffen plan, in German eyes, was that it neatly took into account the French doctrine of attack Some authorities have called this a pinwheel strategy, each nation attacking and driving the enemy back However, Schlieffen's planned envelopment was to be so powerful, so swift and so unexpected in the violation of Belgian and Dutch neutrality that the French armies would be encircled

In the actual invasion, 1.500.000 Germans in seven armies catapulted into Belgium, pulverized the Belgian forts with their new 17-in howitzers and entered Brussels on Aug. 20 Schlieffen had died the previous year, after admonishing his successors to keep "the right wing strong" However, the enveloping wing was not so preponderant as Schlieffen had wished and it was compressed into a smaller corridor by the political decision not to violate Dutch neutrality.

Though the French army's right wing had reached the Rhine, its centre was endangered by a German pincers Only a hastly withdrawal in that area and a general retreat early in September prepared the Allies for the "miracle of the Marne." This was a general counteroffensive, utilizing such hastily mobilized combat forces as Gen. Joseph Galheni's taxicab army, which struck the unprotected German right flank. Paris was saved.

Meanwhile, on the eastern front the German prewar strategy of a defensive holding until France had been defeated in a quick invasion was compromised by the Austrian desire to take the offensive against the Russians immediately upon the declaration of Though the Austrians were defeated by the Russians at Lemberg in September, the German forces simultaneously won the

tremendous victory at Tannenberg

By November, the war had become stalemated on both the eastern and western fronts. The conflict settled down into trench warfare from Switzerland to the channel, fortifications and siege-craft being of tremendous importance. Strategy had been forsaken as the machine gun and the French 75-mm, artillery gun dominated the battlefield.

Britain's naval blockade of Germany was the key to the grand strategy of the war. It was the same strategy that had been so potent against Napoleon. As in that era, the complementary aim of strategy was to defeat the enemy land forces in the field

Other major considerations in the grand strategy of World War I were the recruitment of replacement man power in great numbers through universal liability, the increased demands upon industry for the munitions of war and the need for technological developments-such as the tank and poison gas-to break the stalemate,

The German attempt to throw off the strangling blockade was submarine warfare. Counteraction by Britain took the form of search of neutral vessels so that Germany's plight was increased Moreover, the German methods eventually brought the United States into the war in 1917.

Gen John J Pershing, when he arrived in France, understood that the antidote for the battlefield stalemate was mobility. Warfare had to be due out of the trenches and become a thing of fire and movement.

The build-up of US forces was necessarily slow-time and space requiring their toll Once the requisite troops were assembled, the military strategy became one of reducing the salients within the Allied lines, such as that at St. Mihiel

When Germany had reached a stage of semistarvation, and its armed forces a point of exhaustion, it asked for an armistice. Hastening this decision was the defection of the other Central Powers during the autumn of tor8. The Allies had weathered the collapse of Russia in 1917, even though they faced in 1918 a superior German force. German leadership, well appreciating that 1918 was the year of decision before the full might of the United States was brought to the combat theatre, had put its resources into a great offensive which came near succeeding. However, by the late summer of 1018 there was the feeling among the Allies that Germany would inevitably fall by the spring of 1919.

Truly, "Germany won the battles, but lost the war." Acknowledgment that military strategy was a part of a greater national strategy was now accepted by students of warfare Churchill was not slow in pointing out that the decisions of state had a great influence on the strategy of the nation and of the troops in the combat arena. It was Georges Clemenceau who supplied the coup de grace to the historical overriding importance of military strategy, in his statement that war was much too important a business to be left to soldiers. Taken out of context the statement is probably more than Clemenceau intended. He still had great respect for the requirements of military strategy. His statement was an underlining of the social aspect of war and its increasing totality. Modern war could be waged effectively only under a cohesive national strategy.

1918 to 1939 .- The mud of the trenches in France and the superiority of the defense with its "strong right arm," the machine gun, brought forth many false conclusions about the nature of warfare. Strategy came to mean defense. In succeeding years, the Maginot line became the symbol of the defensive concept of warfare. But the strategy of defense had its vigorous opponents

Outspoken adherents of the new strategy of the third dimension. the air, proclaimed that because of its striking power, armies and navies had become lesser appurtenances of war. The bombing of cities and the knocking out of entire fleets were certain to reduce an enemy to submission. The aeroplane itself would be comparatively safe from reprisal from the ground

Meanwhile, land and sea forces would maintain a defensive role. the ground armies holed up in entrenchments or in fortresses The strategy would be that of the offensive, carried out with surprising suddenness and striking at civilian morale. The military muscles of an enemy would remain in existence, but the will power and the brain would be paralyzed. Concentration of air power was not envisaged by Giuho Douhet since he believed that a limited number of bombs and aeroplanes would accomplish the object.

Meanwhile, on the ground, the army generals went ahead with their schemes for breaking the superiority of the defensive. Whether from disagreement with the new doctrine of air power, or from the age-old tradition of seeking the solution on the ground. there began to evolve the modern cavalry of tanks. Development of the slow-moving, thin-skinned, light tank of World War I took the shape of heavier, more powerful, better-armoured vehicles. The Germans and the soviets took the lead in this field, followed in a lesser, experimental way by the United States and Great

Also, in France there were advocates, like Charles de Gaulle, of the necessity of fighting on the offensive in the Foch tradition. But the weight of a defensive morale among the French people was their overbalancing opponent. The cry of the disciple of mobility and of tank warfare was lost in the shouts of the populace for Maginot and "int-down" yarfare. In justice to the French, their losses from World War I had proved devastating, the will for the traditional offensive had been crappled. The populace was ready to accept any alternative which promised economy in human life.

The Germans, meanwhile, during the late 1930s, were foiging an assault team of tanks and air fighters which offered potential overthrow of defensive superiority. The strategy would be Freick the Great's "short and snappy" operations, while maneous team of the statlefield areas was to be a compound of Napoleon and the US Cavil War cavalyr tradition Offensive, surprise, concertation, mobility and co-operation were to be 1e-enshmed as positive principles of war and the backbone of a conquering strategy on the land, this method of war was to prevent the stalemate of World War I.

But Doubet was not to be denied. The bombing of the Allied line of communications and the fouling of that line further by strafing of civilians were to be compelling adjuncts to the efforts of the land forces in their action against the Allied armies However, the supplementary second aim of strategy—the air strike against the industrial and political centre of the British at London—was expected to have a decisive result

Naval strategists were also developing the speed and hitting power of their fleet units. High-speed battleships were produced by all the major sea powers, the Germans using their pocket battleships as sea raiders to prey on shipping. The aircraft carrier became a team member with the battleships, cruisers, destroyers and other fleet units At first, duels between ships appeared to be a normal method of sea warfare, but the battle of Midway in 1942 exhibited a new naval strategy in which opposing fleets never got within gun range of one another, but duelled with their air power and submarines More and more that became the tenor of sea strategy in the Pacific, with the naval task forces gaining strength in carriers and numbers of fleet aircraft. Fleet units throughout the offensive war took up position in amphibious assaults as supporting artillery. The army commander on the ground then had the novel support of artillery from the sea and air, as well as from his conventional land guns. The combining of arms reached a point undreamed of at any previous stage of war-

World War II.—The global warfare of World War II lifted strategy montrovertibly out of the sellm of the multary sphere into the field of international affairs. Global warfare called for global strategy. Nations, recognizing the total effort required in modern war, poured every resource into the accomplishment of their objectives. Waging war demanded a strategy which reached into every phase of lite—political, economic, psychological, technological and moral. Military operations were dictated by national strategies and affected by international commitments. All nations were deven into the content and occan, on the surface of the earth, shove it and below the seas. Massive armed forces, technological developments, three-dimensional warfare, unheard of industrial production and logistical miracles were features of this global war.

The prelude to World War II was supplied by actions of the axis nations—Germany, Italy and Japan. Germany marched into the Rhineland; Italy attacked Ethiopia; and Japan invaded China on the Asiatic mainland.

Germany again sought to avoid a two-front war, while making its position secure in central Europe. Austria and Cezcholovvalat were quickly compured before the commencement of the shooting war. Then with its western front secured by the Slegified fortifications and with the Soviet Union wrapped up in a non-aggression pact, Germany moved tinto Poland on Sept. x, 1939, without a-declaration of war. 'Norway was next captured, permitting Germany to move its submarines into the Atlantic occas.

When the preliminaries had been completed, by May 1940, Germany struck at France in a modified Schieffen plan, again entering Belgium but making its primary blow at the Ardennes forest area. The strategic manocuvre on the ground brought about

the defeat of the French, Belgian, Dutch and British forces A supplementary strategic air bombardment was thrown against the Island home of Great Britain in an attempt to bring capitulation. Though hammered unmercfully, the British people should up to the challenge, their defensive fighter force gradually whitting down the bomber strength of the aggressor. Before the German strategic decision to invade Britain was prepared, it was too late in the vest for a cross-channel amphibious operation.

Meanwhile, Germany had overrum half of France and obtained sufficient submarine bases to permit free operations in the Atlantic Strategically, Germany had won a decisive victory on the western front. It was possible then to turn toward the Balkan and middle east theatres. Success attended the former campaign, and the conquest of the Suez canal and capture of the middle east was averted by a narrow margin. Butish forces fighting in the Libyan desert gave ground but evaded annihilation, while holding on to Egyot.

British strategy during this tenuous early period of the wan centred on an aggressive delense, including the preservation of the life line of the empire through the Mediterranean and Suecanal to India and southeast Asia. In the air, Britain's strategic air force began to make raids against German-held territory on the continent. The national endeavour was to hold on doggedly until the Allies brought assistance, particularly the United States and the Sowiet Union.

His western front scure, Huter began to consoludate his eastern. His western front sent the Balkans. Sover protests to these German movements to the Balkans Sover protests to these German movements of the crystallans. Hite's deed protect to the sovert there. Multary observers concluded that the German blutzkring was powerful enough to accomplish what Napoleon had not been able to do. But the German army, once through the Stahm line fortifications, quickly learned that their antagonist did not capitulate. Instead, the sovert defenders fought doggedly, whether in partisan warfare behind the German lines, or in last-ditch stands before Moscow, Lemngrad and Stalingrad.

When the winter of 1041 caught the Germans unprepared and still seeking victory, they obtained the support of Japan, which made a surprise attack on the United States armed forces at Pearl Harbor, Hawau. Immediately, the Japanese struck southward against the Philippines, Medanesia, Indonesia and southeast Asia

The strategic contest was then joined. The axis nations, operating on interior lines, were able to supply their forces with the requisite munitions of war. The Allies, other than the Soviet Union, were compelled to fight on extenor lines, their logistical support fanning out from factories in Britam and the United States to all comers of the globe. Once again, the strategic formula of blockade against the axis countries was applied. And once again, Germany and Japan resorted to large-scale submanne operations to cripple the life lines to forces oversees and reduce supplies flowing from the United States and Britain to the Soviet Union.

On the Allied side, the USSR continued a one-front strategy, maintaining until the last weeks of the war a neutrality on its far eastern front. Britain and the United States, on the other hand, were fighting a two-front war. The grand strategy demanded a concentration of strength. Germany was the primary and most callenging enemy in raw power and in its threat to the democratic peoples of Europe. National strategy dictated concentration in the Atlantic world. The defensive was to be turned to full-fledged offensive when the war-making potential of the western world was more fully realized. Time and space were major considerations. Somehow axis forces in Europe had to be contained and the devastating submarine warfare blunted.

Meanwhile, the U.S.-British Pacific strategy was determined as the strategic defensive initially, to be followed by the offensive-defensive. The military terminology of the strategic defensive might be summed up as a hold-the-line effort with minimum resources, while storing up land, sea and air forces in preparation for later small-scale offensive operations. When the period of the offensive-defensive strategy was reached, allocations of resources would be large enough to permit offensive operations of wider scope. Eventually, when the war in Europe was won, the strategy would be an all-out offensive.

In Europe, the US-British forces took the initiative in the air bombardment of German-held territory from the United Kingdom base, while utilizing land, sea and air forces in North African operations to assure the line of communications through the Mediterranean and save the middle east Subsequently, operations against Sicily and Italy knocked Italy out of the war, made available air bases for attack against Germany from the south and prepared the way for the essential return to the continent by invasion. By that time, the offensive strategy of the Allies from both east and west was in full swing. The soviets and the western Allies were then able to bring terror to German strategists in a full-scale two-front was. When the combined assaults reached a crescendo, the basic aim of strategy-the defeat of the German armed forces-was to be achieved. From the orthodox and traditional viewpoint, Germany must then fall,

In co-operation with this land-sea effort, the Allied forces employed their bombing fleets, the "strategic air forces," against the axis powers. An strategists postulated the second aim of strategy, in extension of Doubet. They believed that the capitulation of Germany could be assured if the air forces, in sufficient strength, were brought to bear against the industrial warmaking production As a necessary prelude to all-out, round-the-clock bombing, air commanders stressed the need for control of the air The Germans and Japanese had effected a partial defense against the bomber both through the employment of anti-aurcraft artillery and more devastatingly through air fighter fleets. The latter needed to be whittled away before the bombers could accomplish their task without prohibitive losses During the war, air power was not able to prove its decisive nature, according to many air enthusiasts. From a strategic standpoint, it was impossible during the fighting

of a war to put all production, man power and other resources into the untested air strategy Consequently, air power was allocated only a share of Alhed resources, while a substantial portion was given to the ground and naval forces

ground and maval irores

The aim of conquering the axis armed forces was vigorously pursued once the Allied armes had taken up the offensive. Into the combined effort was thrown every available resource. Amphibious assaults were necessary from North Africa to Normandy in the European theatic, and from Guadalcanal to Okinawa in the Pacific, before the victory

was won type of landing, but he had to assure his supply line into the area Furthermore, bases were usually selected in areas where the Allied fleets could operate. Finally, the normal course was to select landing areas within efficient range of fighte aircraft, normally estimated at 125 mi maximum.

Great care was exercised also in selecting amphibious landing areas in which there was the opportunity to strike at the rear of the enemy, or at least to make him retire. The most abortive of such efforts was the ill-fated Anzio operation, north of Salerno, behind the German lines. The Allied forces on the main land offensive were held up in the Monte Cassino area, permitting the Germans to bottle up the amphibious flank attack for several months.

Casano area, pe mutting the Germans to bottle up the amphibious flank attack for several months. The several months is a several months of the global curves effortive was made to outperform the strategion to the global curves effortive was readed to outperform the strategion of the publication of the properties of the composition of the opposition of the properties of the composition of the opposition opposition of the opposition oppo

fighters leading the assault. Combat operations were rarely static. The German fortification of the West wall proved no more an obstacle to the Allies than the Magmot Ine had to the Germans

On the soviet front, mass, concentration of forces and surprise with huge manocuvres outflanking the Germans were the keynotes. The offensive studegy of the Red army was one of massive encirclements, tultizing guerrilla strength behind the German lines, and tank assaults. in which thousands of tanks participated, supported by the obstinate efforts of the soviet soldier and the tank-busting, low-flying soviet air

Strategy came of age in World War II. Science, diplomacy, industry and psychology were all harnessed in the total effort of each artagonist to win the war. Although military shategy—the positioning of the armed forces—for battle was of immense importance, it was overshadowed by the national strategies involving the social character of entire peoples Critics of the strategy of World War II found certain pelling need for the creation of over-all strategic principles which would assure each element of the nation's strategy, whether military, economic or political, its appropriate share in the making of decisions. If one general criticism of the conduct of World War II is to be made, it is that political policies and decisions were not given sufficient weight over purely military decisions in the development of strategy On this over purely military decisions in the development of strategy. On this inc, the military stategy was rightfully concrosed with winning the war many stategy was rightfully concrosed with winning the war prolongation of the war for the accomplishment of a political objective might have been more in the long-term interests of a number of nations. Later Strategy; Korean War.—Of great significance in the post-war era was the "old war" strategy. Its base and was peace. This

war era was the "cold war" strategy. Its basic aim was peace. This goal demanded deterrents to var, with such preparation as swe sestifial goal demanded deterrents to var, with such preparation as we sestifial was not synonymous with weakness. There was no other term than strategy to sum up adequately the national efforts, the action and counteraction of political, economic, ideological and psychological forces, supported by troop movements short of a full-scale "shooting force, supported by troop movements short of a full-scale "shooting to the property of the strategy of the strate

The accomplishment of national objectives without recourse to total war had become the ultimate aim of strategy, a nation which could attain its goals without touching off World War III had certainly used its national resources efficiently

its national resources efficiently

Two new strategic developments were exhibited in the postwar era

When the USSR made Czechoslovakia a satellite, it utilized coordinated political, economic, military and psychological pressures. The

Atlantic nations outside the soviet orbit created the North Atlantic Treaty organization for the defense of the western nations Signifi-cantly, the mittal effort was to assist the western European nations to regain their economic strength as a foundation for the creation of regain tueli economic steingm as a roundation for the reaction of military defense in a sense, concentration of soviet power against Czechoslovakia and the economic rehabilitation of western Europe as an underpinning for military defense are strategic developments in a newer, more extended frame of reference Logically, this expansion of newer, more extended frame of reference Logically, this expansion of strategy into every field of national endeavour was a recognition of the social aspects and total nature of conflict.

one social supecis and total nature of contict.

The Korean war commencing in 1950 brought into combat the North
KT has Korean war commencing in 1950 brought into combat the North
KT was the Combat 
Overshadowing the possibility of future world war was the threat of the atomic and hydrogen bombs, guided missiles and chemical, biological and radiological weapons.

What had been the effect of these scientific developments on the nature of warfare and therefore upon strategy? From all appearances, nature of warfars and therefore upon strategy? From all appealances, strategy defined as the efficient application of national issuaues to the achievement of national objectives was still valid. The great question concerned the methods and means of warfare New developments such as guided missiles and army artiflery with a tomic washeads and nadar-operated acoplanes promised many changes in the air of war and in strategy. In the debate between those who placed pumary reliance on the new methods of war and those who chammoned outhodox land-sea-air forces supplemented by atomic weapons, advocates of both methods substantially agreed that there would be no victor in the devastation of another world war. The strategic aim was to prevent holocaust. (See also War)

STRATEGY, NAVAL: SEE NAVAL STRATEGY AND TACTICS. STRATFORD, JOHN DE (d. 1348), archbishop of Canterbury, was born at Stratford-on-Avon and educated at Merton college, Oxford, afterward entering the service of Edward II He served as archdeacon of Lmcoln, canon of York and dean of the court of arches before 1323, when he became bishop of Winchester, an appointment which was made during his visit to Pope John XXII at Avignon and which was very much disliked by Edward II. In 1327 the bishop joined Queen Isabella's partisans; he drew up the six articles against Edward II, and was one of those who visited the captive king at Kemilworth to urge him to abdicate in favour of his son. Under Edward III he became a member of the royal council, but his political importance dates from the fall of Roger Mortimer. In November 1330 Stratford became chancellor, and for the next ten years he was the king's most prominent adviser and the "head of the Lancastrian or constitutional party" (Stubbs) In 1333 he was appointed archbishop of Canterbury, and he resigned the chancellorship in 1334. He was again chancellor from 1335 to 1337 and for about two months in 1340 In November 1340 Edward III, humiliated, impecunious and angry, returned suddenly to England from Flanders and vented his wrath upon the archbishop's brother, the chancellor, Robert de Stratford Fearing arrest John de Stratford fled to Canterbury, but after a violent dispute the principle was established that peers were only to be tried in full parliament before their own order (en pleyn parlement et devant les piers). The archbishop acted as president of the council during Edward's absence from England in 1345 and 1346, although he never regained his former position of influence. He died at Mayfield in Sussex on Aug. 23, 1348.

STRAIFORD, a city and port of entry of Ontario, Canada, and capital of Perth county, situated 83 mi W.S.W. of Toronto by the Canadian National railway on the Avon river. Pop. (1937) 18,785. The repair and engineering shops of the railway, flour and woollen mills, furnature and agricultural unplement works are the principal industries. It is in the heart of itch dairy county, and there is a large export trade in cheese and farm profluce.

STRATFORD DE REDCLIFFE, STRATFORD CAN-NING, VISCOUNT (1786-1880), British diplomatist, was born in Clement's Lane in the city of London, on Nov. 4, 1786. His father, Stratford Canning, uncle of George Canning (q v.), who had been dismherited for his marriage with Mehetabel Patrick. died when the boy was six months old. He was educated at Eton, and had kept two terms at King's college, Cambridge, when, in 1807, his cousin, George Canning, gave him an appointment in the foreign office. In 1808 he was appointed first secretary to Robert Adair, ambassador to Constantinople. When Adair was transferred to Vienna in 1810, Canning remained at Constantinople as chargé d'affaires. Canning was lest entirely to his own discretion. In May 1812 he helped to arrange the peace of Bucharest between Turkey and Russia, which left a powerful Russian army free to repel Napoleon's invasion, Canning was able to basten the decision of the Turks, by making judicious use of Napoleon's plan for the partition of their empire. A copy of it had been left in his hands by Adair to be used at the proper moment. In July he left Constantinople with the desire to enter political life at home. But Castlereagh arranged for him to receive a retaining fee binding him to the service. He spent four years as minister at Berne (1814-18). In 1819 he was appointed minister at Washington, a station of great difficulty owing to the

many questions outstanding between the British and the US governments Cannang, who had a quick temper, came into occasional collision with John Quancy Adams, the US secretary of state Yet they paited with mutual respect Canning returned to England in 1823. The general treaty he had arranged with Adams was rejected by the United States senate

In 1824 Canning was selected as ambassador to Turkey, and proceeded to Constantinople after a preliminary visit to Vienna and to St Petersburg, where he discussed the Alaska boundary question and sounded the Russian government as to the course to be taken with the Greek revolt against Turkey He left for Constantinople in October 1825 At Constantinople he was engaged with the French and Russian ambassadors in the hopeless task of inducing Sultan Mahmud II to make concessions to the Greeks, without the pressure of armed force After the battle of Navarino (q v ) on Oct. 20, 1827, the ambassadors retired to Corfu Canning then went home, but was sent back on July 8, 1828 Canning did not agree on all points with Lord Aberdeen, and in 1829 he, for the time being, turned from diplomatic to parhamentary life. He sat for Old Sarum, for Stockbridge (rotten boroughs) and for Southampton, but did not make much mark in parliament He was twice absent on diplomatic missions At the end of 1831 he went to Constantinople to attend the conferences on the delimitation of the Greek frontier, arriving immediately after the receipt of the news of Mohammed Ali's invasion of Syria. (See Mohammed All) Sultan Mahmud now proposed to Canning an alliance between Great Britain and Turkey, and Canning strongly urged this upon Palmerston, pointing out the advisability of helping the sultan against Mohammed Ali in order to forestall Russia, and of at the same time placating Mohammed All by guaranteeing him certain advantages. This advice, which largely anticipated the settlement of 1841, was not followed, but Canning himself was in high favour with the sultan. In 1833 he was selected as ambassador to Russia, but the tsar Nicholas I, who knew his peremptory methods, refused to receive him

Canning was again sent to Constantinople in Jan 1842 and remained there as ambassador until 1858. His tenure of office in these years was made remarkable-first by his constant efforts to induce the Turkish government to accept reform and to conduct stself with humanity and decency; then by the Crimean War (q.v.). Canning had no original liking for the Turks He was the first to express an ardent hope that they would be expelled from Europe with "bag and baggage"-a phrase made popular in after times by Gladstone. But he had persuaded himself that under the new sultan Abd-ul-Mepd they might be reformed the fall of Palmerston's ministry in Feb 1858 he resigned He had been raised to the peerage in 1852. During his later years he wrote several essays collected under the title of The Eastern Question (1881). In 1873 he published his treatise, Why I am a Christian, and in 1876 his play, Alfred the Great at Athelney. The only son of his second marriage died before him. His wife and two daughters survived him Lord Stratford died on Aug. 14, 1880, and was buried at Frant in Sussex. A monument to him

was erected in Westminster abbey in 1884.

Ser S. Lane Poole, Life of Lord Stratford & Redelife (1888),
STRATFORD-ON-AVON, a municipal borough mainly on the west bank of the Avon, in the Warwick and Leamington parliamentary division of Warwickshire, England; served by the G.W., L.M.S. and L.N.E. milawas. (London 924 mi.; Birmingham 334). Pop. (1951) 14,980. Area 10.8 sq.m. The neighbourhood is beautiful and the river flows in exquisite wood teaches, navigable only for small boats. The Stratford canal communicates with the Warwick and Birmingham canal. The river is crossed at Stratford by a stone bindge of 14 arches, built by Sir High Clopton in the regin of Henry VII. The church of the Holy Tot. When the sales of the control of the

sione," in connection with which the church became collegiate The present choir was built by Dean Balshall (1465—91), and in the reign of Henry VII the north and south transepts were errected A window commemorates the Shakespearan scholar Hallwell-Phillipps The chaple of the Guild of the Holy Cross was begun by Robert de Stratford. The guild, for both serse, was in exastence early in the 13th century, and was incorporated by charter from Edward III in 1322. It was dissolved in 1547. The guildhall is a picture-que half-timbered building. A beautiful 16th century house belonged to Thomas Rogers, whose daughter was mother of John Huvard, founder of Harvard college, U S A Among public buildings are the town hall (1654, rebuil 1767, altered 1863), market house, com exchange and three hospitals. Brewing is Desempts and there is an agricultural tade, founsits bring much bustness.

modern eyes the buildings which Shakesneare saw was not entered upon till the end of the 18th century, when much of the visible connection with his times had been destroyed. A 100m, by tradition his birth room, is shown The walls bear innumerable signatures, among which such names as Walter Scott, Dickens and Thackeray may be deciphered Part of the building, used by the poet's father as a wool shop, is fitted as a museum. Shakespeare may have attended the grammar school in Church street, a foundation in connection with the Guild of the Holy Cross, but refounded after the dissolution by Edward VI in 1553, and bearing his name The site of "New Place," built by Sir Hugh Clopton and bought by Shakespeare in 1507, was acquired by public subscription, chiefly through the exertions of J. O. Halliwell-Phillipps. and handed over to the Shakespeare Birthplace trustees in 1876. Shakespeare is buried in the chancel of Holy Trinity church next his wife. Over his grave are the lines beginning

## Good Frend, for Icsus sake forbeare To digg the dvst enclosed heare

For the effigy see STARKESPEAR, WILLIAM, POSTRAILS. Further connections with the poet and his family are to be found The museum adjacent to New Place was the house of Thomas Nash, who married Shakespeare's granddaughter Elhzabeth Hall. A Shottery, I mi W. of Stratford, is the thatched cottage in which shakespeare's wife, Anne Hathway, was born I twas purchased for the nation in 1892. The poet's mother was Mary Arden, and this name, that of an ancient county family, survives in the "Forest" of Arden, northwest of Stratford Al Snitterfield to the north lived Shakespeare's grandfather and uncle.

The principal modern monument to the poet's memory is the Shakespeare Memorial, erected in 1837 to contain a theatic, picture gallery and library. Of this the theatre was destroyed by fire on March 6, 1926, but a new one, designed on modern lines by Elizabeth Scott, was opened on April 25, 1932. A Shakespearian season is given annually.

History.—Stratford is a place of great antiquity. A Roman road may have run past the site coins, etc, have been found, and the district at any rate was inhabited in Roman times. The manor was granted by Offic to the bishops of Worcester; and it was under the protection of the bishops of Worcester; and the was under the town early assumed burghal rights. The Guild of the Holy Cross, founded in the 13th century for the support of poor priests and others, exercised authority over the town for many years. Its dissolution was the cause of the incorporation charter of Edward VI in 1535. Another charter, altering the constitution of the corporation, was granted in 1611. Other charters were granted in 1664 and 1674.

STRATHAVEN (hoally pronounced Strion), a manufacturing and market town in Avondale civil parish, Lanatschire, Sociald. Pop (1937) 4,288. It is on the Avon, 16 ml. S.S.E. of Glasgow by road, and is the termitius of the LaM.S.R. company's branch line from, Hamilton. The local trade is chiedy in chees and grain, but there are manufactures of silk, cotton and hosiery. The ruins of Avoidade castle are on a stream that trues through Strathaven to join the Avon, a mile below the town. St miles S.W., on the moor of Drumclog, the Covenanters defeated John

Graham of Claverhouse, Viscount Dundee, June 1, 1679. A granite obelisk commemorates the battle.

STRATHCLYDE, the name given in the 9th and 10th centures to the Britsh (Welsh) kingdom, which from the 7th century enward was probably confined to the basin of the Clyde, together with the adjacent coast districts, Ayrahire, etc., on the west of Scotland Its capital was Dumbarton (fortress of the Britons), then known as Alculut On the south this kingdom bordered on the territories of the Nichari Picts of Galloway, including the modern counties of Wigtown and Kirkculdright. Stratchyde is also sometimes called Cumbria, or Cumberland, and the survival of the latter name on the English side of the border preserves the memory of a period when the territories of the northern Welsh were of much reader extent.

After the withdawal of the Roman in the 5th century the

Such notices as we have of the history of Strathclyde in the 7th and 8th centuries are preserved only in the chronicles of the surrounding nations and even these supply us with little more than an incomplete record of wars with the neighbouring Scots, Picts and Northumbrians It is probable that the Britons were allied with the Scots when Aidan, the king of the latter, invaded Northumbria in AD 597. In 642, however, we find the two Celtic peoples at war with one another, for in that year the Britons under their king Owen defeated and slew the Scottish king Domnall Breac In the same year they came into conflict with the Northumbrian king Oswio. In 649 there appears to have been a battle between the Britons and the Picts, but about this time the former must have become subject to the Northumbrian kingdom. They recovered their independence, however, after the defeat of Ecginth by the Picts in 685 In 711 and again in 717 we hear of further wars between the Britons and the Scots of Dalriada, the former being defeated in both years. Toward the middle of the 8th century Strathclyde was again threatened by an alliance between the Northumbrians and Picts, and in 750 the Northumbrian king Eadberht wrested from them a considerable part of their territories in the west including Kyle in Ayrshire. In 756 the North Britons are said to have been forced into submission and from this time onwards we hear very little of their history

In 870 Dumbarton was attacked and destroyed after four months' siege by the Scandinavian king Ivarr, and for some time after this the country was exposed to ravages by the Norsemen It is believed that the native dynasty came to an end early in the 10th century and that the subsequent kings belonged to a branch of the Scottish royal family. Toward the end of the reign of Edward the Elder the Britons of Strathclyde submitted to that king together with all the other princes of the north. In the reign of his successor Aethelstan, however, they joined with the Scots and Norwegians in attempts to overthrow the English supremacy, attempts which were ended by their defeat at the battle of Brunanburh in 937 In 945-946 Strathclyde was ravaged by King Edmund and given over to the Scottish king Malcolm 1. the kingdom was only temporary, for we hear of a defeat of the Scottish king Cuilean by the Britons in 971. In the 11th century Strathclyde appears to have been finally incorporated in the Scottish kingdom, and the last time we hear of one of its kings is at the battle of Carham in 1918 when the British king Owen fought in alliance with Malcolm II.

STRATHIONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, BARON (1826-1914). Canadan statesman and financier, was born at Forres, Scotland, on Aug. 6, 1820. In 1838 he was appointed a junior clerk in the Hudson's Bay company, sent to Labrador and stationed at Hamilton Inlet. For thirteen years he roughed it there, learning the fur trade. Then was for the years on Hudson bay, rising in the company's serv-

ice to be a chief trader and then a chief factor

In 1868 he was appointed to the post of resident governor, with headquarters at Montreal.

The construction of the Canadian Pacific railway had become a practical question in 1872. Smith, together with his cousin George Stephen, and other Canadian and US financiers, boughet he insolvent St. Paul & Pacific railway which by 1873 had been completed from St. Paul to Breckenridge The new owners persuaded the government of Mantioba to build a line from Winnipeg to Pembria on the US frontier. This done, in 1879 the partners formed the St. Paul, Minneapolis & Mantioba Railway company, and by continuing the line from Breckenridge to Pembria united Mantioba with the south and west. In 1880 the government made a contract for building the Canadian Pacific railway with a syndicate of which Stephen was the chief director, and in which Smith, from the first largely interested, came more and more to the front. On Nov. 7, 1885, at Cragellachier in the Rocky mountains, Donald Smith drove the last spike of the first Canadian transcontinental railway.

In 1882 he left parliament, to which he had been elected first in 1872, but returned to it in 1887, and represented Montreal West until 1896, when he was appointed high commissioner for Canada. In that year he was made G C.M.G., in 1897, he was raised to the peerage and in 1909 made G C.V.O. In 1889 he became governor of the Hudson's Bay company.

He died in London on Jan. 21, 1914.

STRATHNAIRN, HUGH HENRY ROSE, 1ST BARON (1801-1885), British field-marshal, third son of the Right Hon Sir George Henry Rose of Sandhills, Christchurch, Hants , minister plenipotentiary at the Prussian court, was born at Berlin on April 6, 1801 He was educated at Berlin, and received military instruction at the cadet school. He entered the army in 1820. and received rapid promotion. As a major in the gand Highlanders he was employed in maintaining order in Ireland in 1830 He then served in the Mediterranean. In 1840 Rose, now a heutenant-colonel, was selected, with other officers and detachments of Royal Artillery and Royal Engineers, for special service in Syria under the orders of the foreign office. They were to co-operate on shore, under Brigadier-General Michell, R A --in conjunction with the Turkish troops-with the British fleet on the coast, for the expulsion of Mohammed Ali's Egyptian army from Syria. Sir Stratford Canning sent Rose from Constantinople on a diplomatic mission to Ibrahim Pasha, commanding the Egyptian army in Syria, and after its execution he was attached. as deputy adjutant-general, to the staff of Omar Pasha, who landed at Jaffa with a large Turkish force from the British fleet, Rose distinguished himself in several engagements, and received many honours. Shortly after he succeeded to the command of the British detachment in Syra with the local rank of colonel, and in April 1841 he was appointed British consul-general for Syria. For seven years, amidst political complications and mtrigues. Rose, by his energy and force of character, did much to arrest the horrors of civil war, to prevent the feuds between the Maronites and Druses coming to a head, and to administer justice impartially; and he saved many Christians from massacre.

In 1848 he left Syria on leave, and did not return, as Lord Palmerston appointed him secretary of embassy at Constantiople in January 1851. In 1852 he was charge d'affaites in the absence of Sir Stratford Canning during the crisis of the question of the "help places." During the Ctimean War Rose was the British commissioner at the headquarters of the French army, with the local rank of brigadier-general. For his services he received the medal with three clasps and the thanks of perlainannt, was promoted to be major-general, and was made K.C.B. and commander of the Legion of Honour. On the outbreak of the Indian Multip in 1857 Rose was given command of the Poona division. He arrived in September, and took command of the Central India force, In January 1858 he marched from Mhow, captured Rathgarh after a short slege, and defeated the raja of Banpur near Barodia in the same month. He then relieved Saugor, captured Cartakota and the fort of Barodia, and carby in March defeated

the rebels in the Madanpur Pass and captured Madanpur and Chanderi He arrived before Thansi on March 20, and during its investment defeated a relieving force under Tantia Topi at the Betwa on April first. Most of Rose's force was locked up in the investment, and to Tantia Topi's army of 20,000 he could only oppose 1,500 men, yet with this small force he routed the enemy with a loss of 1,500 men and all their stores. Thansi was stormed and the greater part of the city taken on the 3rd, and the rest the following day, and the fort occupied on the 5th Kunch was captured, after severe fighting in a temperature of 110° in the shade, on May 7. Under the same conditions the march was made on Kalpi. The rebels attacked his small force, exhausted by hard marching and weakened by sickness, but after a severe fight (May 22) they were utterly routed and Kalpi occupied the following day Sir Robert Napier (qv) had been appointed to succeed him, when news came of the defection of Sindhia's troops and the occupation of Gwalior by Tantia Topi Rose at once moved on Gwahor by forced marches, and on June 16 won the battle of Morar Leaving Napier there, he attacked Gwalior on the 19th, when the city was captured The fortress was stormed and won the following day, and Napier gained a signal victory over the flying enemy at Taora-Alipur on the 22nd. Rose then made over the command to Napier and returned to Poona It was to Rose's military genius that the suppression of the Indian Mutiny was largely due, but owing to official jealousy his ment was only tardily recognized. But in June 1860 he succeeded Lord Clyde as commander-in-chief in India. Rose improved the discipline of the army, and his powerful assistance enabled the changes consequent upon the amalgamation of the East India Company's army with the Oueen's army to be carried out without friction

STRATIPEFFER, village in Fodderty civil parish, Ross and Cromarty, Scolland, 5 mi. W. of Dingwall by the L.M.S railway. Fop (1937) 4479 It lies in a valley, sheltered on the west and north There are several sulphurous and chalybeate springs, no great repute for the cure of rheumatism, skin diseases and anaemia, and Strathpeffer is the most fashionable spa in Scotland There is a vitrified fort at Knockfarrel, 3 mi. E.

STRATHSPEY, Scottish dance believed to have had its origin in the 18th century in the valley, or strath, of the Spey, whence its name.

STRATIGRAPHY is a branch of science which may be defined as the study of the relative position and order of succession of deposits containing or separating archaeological material. Stratified deposits may be classified under (1) Archaeological, (2) Archaeological and Geological, (3) Geological.

(1) A purely artificial accumulation, as on a town or settlement site of historic or comparatively late prehistoric age. The section through the Temple of Artemis Orthia at Sparta is a fine example of stratigraphical work yielding chronological information covering at least 1,000 years. Study of this section shows the older deposits divided from the newer by a sand stratum The lower levels dated by their respective potteries, cover the period of an early temple represented by an altar and walls. The sacrificial deposits are of unequal thickness on both sides of the altar, indicating that one side was kept clear for officiation. The altar was therefore in existence while the surrounding strata were accumulating. Contrasted with this is the uniformity of level near the walls, showing that these are more recent than the deposits through which they were cut This early temple appears to have been destroyed by flood, and our next period belongs to rebuilding in the 6th century BC. The site was artificially levelled up by a sand deposit of 11 metres thick in order to raise the new temple above flood level. The Greek altar and associated deposits belong to this period This building remained in use until a following the construction about 178 a.c. The Roman period is superirested, beginning about 350 years later. Inscriptions, ranging from the 4th century B C to AD 235 built into the foundations of the theater prove that it can hardly be earlier than AD 250, since a stele is unlikely to have been thrown aside less than 25 years after its creetion

(a) A combination of natural and artificial conditions, best exemplified by cave deposits, showing strate of early human occupation, interbedded with strate of godegal formation such as stalgamute floor, or flood-borne silf. Cavyan and after the contraction of the stalgamute floor, or flood-borne silf. Cavyan and after the contraction of the contract

In the section through the Rock Shelter at Laussel, S France, we have strata tilting and overlapping. The oldest deposits of lower and middle palacolithic age lie some distance from the sheltering chiff. There follows a long interval when the site was abandoned and chiff detrius and humus raised the level. Upper palaeolithic man returned and resumed discontinuous occupation Deposits cover probably a period of at least 25,000 years. The section illustrates the confusion in interpretation of sequence which would result from unsuable methods of excayation.

(3) Stratigraphical condutions fall within the domain of archae ology. There comes, however, a point at the bennume of the human record when archaeological stratigraphy merges into pure geology. River-terrace gravels listinate this category. The major river valleys frequently show old terraces of sand and gravel at various beglats above the present stream These mark former levels. In many cases these old terraces contain fossil animal remains and palaeolithe fluit implements of different ages. In the case of river gravels, however, the usual law of stratigraphical sequence as shown in (r) and (2) is inverted; the highest terrace will normally (though not invariably) have been deposited first, and will contain the oldest material, whilst the formation of the lower terraces will be episodes in the later degradation of the river bed. Material from the older deposits may consequently be washed into the later ones; the true age of an alluval deposit is that of its most recent content.

The section of the Somme near St. Acheul, France, shows that river gravel stratigraphy is rendered additionally complex by over-lying deposits of later date covering older and younger terraces which contain in their turn archaeological material

See J. P. Droop, Archaeological Excavations (1906). (G. C.-T.)

STRATOSPHERE, the portion of the atmosphere lying above six miles in elevation, where the temperature ceases to fall with increasing altitude, is called the stratosphere or, more descriptively the isothermal layer. From the earth's surface up to about six miles, the temperature diminishes nearly uniformly at the rate of about 6° C. per kilometre (1° F. per 300 feet) reaching the low level of about -55° C. (-67° F.). Beyond this height there is little change or a slight rise of temperature to an elevation of at least 25 miles. Two considerations indicate that much higher temperatures prevail in the atmosphere above 60 miles. Firstly, loud sounds are sometimes heard at great distances, though silent at intermediate localities. Those atmospheric layers near the earth's surface, where temperature falls with increasing height, bend the sound path upwards, and those at high levels, where the gradient is rising, reverse the curvature and lead the path downward to the distant listener. Investigations of sound reception indicate that the atmospheric temperature above 60 miles is at least as high as that of the earth's surface at the tropics. Secondly, studies of short wave radio reception have led several authors to suggest that much higher temperatures, even perhaps 1000° C. (1800° F) must prevail at a height of 200 miles in the atmosphere,

The causes of the remarkable temperature conditions of the stratosphere and higher are not fully worked out They depend on the absorption and emission of radiation—solar, terrestrial, and atmospheric. These depend particularly on the proportions of exone, carbon dioxide, and water vapour which are there in minute proportions not yet exactly known.

The barometric pressures prevailing at high altitudes are of course very low, as shown by the table.

Barometric Pressure at High Altitudes

Altıtude in miles.		,	5	10	15	20	25
Percentage of sea level	pressure		35	10	3.0	0.85	0.25

By 1943, the highest level yet reached by unmanned sounding balloons carrying selfrecording instruments was about 25 miles Manned balloons require hermetically sealed chambers fed by oxygen, and specially air-conditioned, to reach heights or ro to 75 miles As such enclosures are necessarily very heavy, the sizes of balloons required to float them in highly rarefied air become immense, and prohibitively costly.

Exact knowledge of stratospheric conditions was greatly pronoted by the ascension of the immense manned balloon "Explorer II," of 3,700,000 cu ft. capacity, on Nov. 11, 1935, under the joint auspices of the National Geographic society and the United States air corps, with co-operation by other institutions. See National Geographic society publication, "Stratosphere Series Number 2," Washington, 1936. The extreme altitude reached was 72,305 ft. Houzontal and vertical cosmic rays were found of equal intensity at 72,000 ft. At ceiling the electrical potential of the balloon was 400,000 volts above the earth. One-fourth of the atmospheric ozone lay below 72,000 ft The air was very slightly less rich in oxygen at ceiling than at ground level. The sky above 72,000 ft was only one-twentieth as bright as at ground level. Five bacteria and five moulds were found surviving at 36,000 ft. A remarkable horizontal photograph, taken at ceiling, shows the curvature of the earth and the blackness of the sky. (C. G. A)

STRAUBING, German town in Lower Bavaria, on the Danable, 25 ml. S.E. of Regensburg, by rail to Passau, Pop. (1335) 29,180. Straubling is a town of remote oragm, believed to be identical with the Roman station of Sorbodusum. In definite history, however, it is known only as a Bavarian town, and from 1353 to 1425 it was the seat of the ducal line of Bavaria-Straubing. Its oldest building is the tail square tower dating from 1205. The industries are iron and tin founding, tanning, brewing, manufacture of machinery and chemicals, trade in wine and cattle.

STRAUSS, DAVID FRIEDRICH (1803-1874), German theologian and man of letters, was born at Lardwigsburg, near Stuttgart, on Jim. 27, 1808. After a short interval of teaching he went to Bershu (1831), but Hegel died jiu sat it the time of his arrival, and of Schleienmacher's lectures only those on Jesus interested him. But he mixed with the disciples of Hegel, and conceived the main idea of his two great works—the Leben Jesus and the Christitche Dognastik. He returned to Tülbingen, where he lectured for a time, but soon found it necessary to give his whole energies to the preparation of his book, the Leben Jesus (1835). The work produced an immense sensation by its destructive method. In 1840 and the following year he published his Christ-liche Glaubenslehre (2 vols.), the principle of which is that the history of Christian doctrines is their dissusceration.

Between the publication of this work and that of the Priedline's Bildier be had been elected to a chair of theology in the university of Zbrich. But the appointment, provoked such a storm of popular ill will in the cannot nat the authorities pensioned him off before he was installed. With his Claubenslehre he took leave of theology for upwards of twenty years. He then published a series of biographical works, which secured for him a permanent place in German literature (Schubarts Leben, 2 vols., 1849, Christian Marklin, 1851, Nikodemus Frischlin, 1855, Ulrich von

Hutten, 3 vol., 1859–1860, 6th ed. 1895, H. S. Reimarus, 1862). With this last-named work he returned to theology and two years afterward (1864) published his Leben Jess für des deutsche Volk (13th ed., 1994). His Cheristus des Glaubens und der Jesse der Geschichte (1865) is a severe criticism of Schleermacher? lectures on the life of Jesus, which were then first published From 1865 to 1872 Strauss resided in Darmstadt, and in 1870 published his lectures on Volleure (9th ed., 1907). His last work, Der alte und der neue Glaube (1872, 16th ed., 1904, English translation by M Blind, 1873), caused some consternation among his friends. Like all his critical works it suffered from his lack of critical study of the text themselves

of critical study of the fevts increase very published in a collected edition in 1 vol. by E. Eelist (1856–58), without in Christickie and the contract of the

STRAUSS, JOHANN (1804-1849). Austrian orchestral conductor and composer of dance music, was born at Vienna on March 14, 1804. In 1819 he obtained his first engagement as a violumist in a small band then playing at the Sperl, in the Leopödstadt, and after acting as deputy-conductor in another orchestra, he organized in 1853 a little band of 14 performers on 18 own account. It was during the carrival of 1826 that Strauss inaugurated a long line of frumphis by introducing his band to the public of Vienna at the Schwan, in the Rossau suburb, where his famous Taubert-Walzer (op. 1) at once established his reputation as the best composer of dance music then living. Upon the strength of this success he was invited back to the Sperl, where he accepted an engagement, with an increased orchestra, for six years.

Later he was appointed kapellmeister to the 1st Burger regiment and charged with the duty of providing the music for the court balls. With the growth of his fame so did the size of his orchestra increase until it ultimately numbered over 200 performers In 1833 he began a long series of tours throughout northern Europe, eventually visiting England in 1838. In Paris he associated himself with Musard, whose quadrilles became not much less popular than his own waltzes, but his greatest successes were achieved in London, where he arrived in time for the coronation of Queen Victoria and played at 72 public concerts besides innumerable balls and other private entertainments. The fatigue resulting from these long journeys seriously injured Strauss's health, but he soon resumed his duties at the Sperl, and on May 5, 1840, he removed with his band to the Imperial Volksgarten, which thenceforth became the scene of his most memorable successes, his conducting being marked by a quiet power which insured the perfection of every mance.

He revisited London in 1849 and after his farewell concert was escorted down the Thames by a squadron of boats, in one of which a band played tunes in his honour. This was his last public things H. Ad idd in Vignes of Series of 1840 of 1840 in the contract of 18

triumph. He died in Vienna on Sept. 25, 1849.

Strauss-was survived by three sons—Johann (1825–99) (q.v.), Joseph (1827–70) and Eduard (1835–1916), all distinguished as composers of dance-music.

STRAIJS, JOHANN, THE YOUNGE (1825-180), Austrian musician, was born in Vienna, Oct. 25, 1835. He was educated at the Gymnasium and the Polytechnic Institute in Vienna and then became a bank clerk, since his father, Johann Strauss (qv), wished him to follow some other profession than music. He studied the violin without his father's knowledge, however, and in 1844 openly declared himself a musician by conducting an orchestra in a public performance. In 1849 the elder Strauss died and the younger, combining his own wortherster with his father's traysled with the group in Austria, Poland sind Germany, winning steep topularity whereven he went. In 1869 he married Jettl Treftz, a popular singer of the day, and in the same year relinculsted the leadership of his orchestra to his two brothers. Josech

and Eduard, preferring to spend his time writing music.

His most famous single composition is An der schonen blauen Donau (The Blue Danube), but he was the composer of so many other medotious and highly successful waltzes, including most notably Wiener Blut, Kunstleiteben and Mon lebt nur enmad, that he won the tutle of "the Walta King" Of his operetus, Die Fledermaus (1874) is the best known, but he wrote 15 others, including Der Karneval in Rom (1873), Caglustor (1875), Prinz Methiusalem (1877), Eme Nacht in Venedig (1883), and Waldmester (1865). He died in Venna, June 3, 1899

STRAUSS, JOSEPH BAERMANN (1870-1938), US engineer, was born in Cincinnati, Ohio, Jan 9, 1870 He was educated at the University of Cincinnati, from which he graduated with the degree of civil engineer in 1892 In 1897 he was appointed designer for the sanitary district of Chicago and in 1904 he founded the Strauss Engineering corporation, of which he remained president until his death About this time, having become interested in bascule bridges, he determined to devote himself exclusively to their design. He subsequently invented five kinds of trunnion bascule bridges, which later became known as Strauss trunnion bascules, and two kinds of lift bridges, also named for him. He was the designer of more than 500 bridges in Canada, the United States, Europe and Asia during his lifetime, including most notably the Golden Gate bridge, which spans the Golden Gate in California and contains the longest single span in the world, the Arington Memorial bridge, Washington, D C, the Columbia river bridge, Longview, Washington; and the Montreal-South Shore bridge, of which he was co-designer. He was also consulting engineer for the George Washington Memorial bridge, which connects New Jersey with New York city. Strauss was one of the first to simplify the design of bridges and to rely for beauty not on decorations added to his bridges, but on line alone

His inventions included the bascule door hangar; a yielding bariter, used not only for the protection of motorists at grade crossings but to assist the landing of planes on aircraft carriers, and a new kind of safety net for workers on bridges. He died in Los Angeles, May 16, 1938.

STRAUSS, RICHARD (1864-1949), German composer, was born at Munich on June 11, 1864, the son of Franz Strauss, an eminent hornist. To some extent a prodigy, Strauss was something of a pianist at four, a composer at six, and at ten he was already seriously studying music under F W Meyer, Munich Hofkapellmeister. Soon the result of this study began to make itself apparent. Singers sang Strauss's songs; the Walter quartet played his Quartet in A (op 2), Hermann Levi performed his D minor Symphony; and Bulow took the composer under his wing and introduced his early Serenade for wind instruments to the Memingen public. For obvious reasons Strauss had not yet found himself. He had passed through the gymnasium and the university, and his music studies had been thorough, but all this had made of him merely an excellent technical musician, who in his Eight Songs (op. 10) and in his Pianoforte Quartet (op. 13) showed how strongly he was influenced by predecessors, Liszt in the one case, Mendelssohn in the other. To Bulow, and even more to Alexander Ritter, Strauss owed the awakening in his own mind of the interest in the modern development of music,

In 1885 Strauss succeeded Billow as conductor of the Meiningan crockestra, but the appointment was held only for a few months, since in April of this year Strauss resigned his post. in order to travel in Italy, and on his return in the early autumn be became third conductor of the Munich opera under Hermann Levi. Four years later he was installed in Welmar as Hofkpaplimester, but once again he held his post for only a brief period, for in 1894, the year of his marriage to Pauline de Ahna, the eminent singer, he was promoted to be first conductor at Munich. Between these various Strauss travelled considerably in the near east and over Europe. He conducted a performance of Elektra, in Beccham's season at Covent Garden unt he spring of 1910, and 483 min 1913 (When his Ariadne auf Nazos was given at His Majesty's), in 1914 (When he conducted his Legend of Joseph at Drury Lane), in 1923 and 1926.

It has often been said that signs of the real Strauss are not to be

perceived before his Don Junn (op 20) and Macbeth (op 23) A year only divided Macbeth (1887) from Don June (1883) Tod mad Verklarmey (1889) is a sensational work. Between it and Till Eulenspiegels Intigen Streiche (1894), Strauss's first opera, Gunteran, finds place (first performance, Wennar, 1894), the latter a work that in spite of much réclame for the composer failed to hold a nosition upon the stage

In Tul Bulenspeeps, one of the most bullantly clever scores eyer penned, is to be found a sense of fun that is worthy of note (as of emulation), and it is perhaps worth recording that no more noteworthy cample of the rondo form exist, in modern muse, while its approximate successor, Don Quizota (1897), is an equally outstanding example of the variation. In Don Quizota the senth as a musical realist was reached. In between came another symphonic poem on the most ambitious scale, inspired by and named after Nietzsche's Also sprack Zaralistiva (1895), which stirred up more temporary strife than any of its piedecessors, if not so much perhaps as was aroused later by the production of Enr. Heldenbelon (1898), or by the comparatively ingenious Symptosia.

phoma domestica (1904).

Up to 1910 Strauss had composed four operas Of these Gimtrem was on frankly Wagnerna lines and had hitle success. Feuersnot, on the other hand, despite the fact that it is largely in the nature of a satural skit at the expense of Munch and its citzens, remained sufficiently alive to ment performance at His Magesty's theatte, London, under Thomas Becknims' direction in July 1910. At Covent Garden in March 1910 Elektra was played to crowded houses and aroused gerat discussion by reason of what was then regarded as its unbridled violence and sensationalism. And later came the not less novel and starting setting of Oscar Wilde's Salome, first produced at Dresden in 1905 and afterward performed at Covent Garden.

A still more important work than any of these was the gay and monance, which was first brought out at Diesden in 1911. Later came Ariabae and Jazos, forming part orignally of a seminuscial setting of Mohere's Le Bourgeon. Gentilomme but subsequently rearranged as an independent work. This was followed, after the dramatic ballet The Legend of Joseph, by Due Fran ohne Schatten (The Woman suthbaut a Shadow), first heard at Vienna in 1913 and containing some of the finest music which the composer ever wrote for the stage; to which were subsequently dedded a "comite play-open". Schomener (Whipped Crosm), both produced at Vienna in 1924, and the opens Helen of Expty (1928), Arbeita (1932), Des schweigsmen Frau (1935), written to Stefan Zweig's libretto of Ben Josson's The Silom Woman, Fredenstag (1937) and Captracio (1941). His Olympic Hymn was a feature of the Bethin Olympia (1936).

In addition to his operas and big orchestral works Strauss wrote more than 100 songs, not a few of which rank hum a true descendant of the line of German song writers During World War II he was absent from public view and was therester a controversial figure, having taken no stand on the political issues of nazism. In 1947 he resumed the baton at the Strauss Festival arranged in his honour in London, where he was warmly received. In 1948 he was officially cleared of all charges by a denazification court. He died at Garmisch-Partenkirchen, Cer. Spot. 8, 1949.

STRAVINSKY, IGOR FEDOROVICH (1882—), Russian composer, was born at Omninchaum, near St. Petersburg (now Leningrad), on June § (old style), 1882. He first studied law, and it was on Rimsky-Korsakov's advice that he made music his career. His first work, a symphony, was followed by other orchestral places. In 1910 he wrote his first bailet, The Priebird, for Diaghliev's Russian company, with which he was later closely associated. This made an immense impression on musicians and the public by the novelty of its construction. It was followed by Petrushka (1911), usually considered his masterpiece, and Le Sacre da pristemps, produced in 1913 in Paris. He then wrote an opera on Hans Christian Andersen's "The Nightingale" (1914).

This was not a success, and in 1917 he rewrote the second and

third acts as a symphonic poem, "The Song of the Nightingale,"

and also staged it as a ballet Next came Renard, L'Histoire du Soldat, Pulcmella, a ballet with songs after Pergolesa, performed in Paris in 1920, a one-act comic opera, Mawa, performed in Paris in 1922, and Les Noces ("The Wedding") (1923)

In his oration-opera Octobe Res (1927) he went back to classical drams. The dramatic interest resides in the vocal parts, the orchestra providing often a mere accompaniment of transparent texture, moving statuesquely, with practically no thematic development and a preponderance of wind over strings in Latin and the chorus is a male one. Against this sober background the solo voices are treated with extraordinary freedom. To the year 1927 also belongs the ballet Apollon Musagdes. Other Stravinsky ballets include Perséphone (1933), Jeni de Cortes (1936), and Orpheus (1948). Stravningly opera The Rebe's

Progress, first performed in Venuce, It, n. 1951, won wude acclaim. Besides his works for the stage he wrote a symphony for wind instruments (1920; rev. 1947); nagtume for small orchestras; Concentro for string quartet (1926), symphony in three movements (1948); he for string quartet (1926), symphony in three movements (1948); become for small chorus and ten undi instruments (1948); pieces for pano, including a sonata, ctudes and two concertos for two unaccompanied panos, and numerous other works, both for orchestra and for small groups of instruments. In 1940 he went to the United States, where he became a lecturer at Harward university. He later became a naturalized US citizen. Stravinsky wrote an autobiography, Chromole of My Life (Eng trans. 1936), and Poetra of Music (1947). See F. W. White, Stravinsky (1948) and A. Tansman, Stravinsky (1948).

STRAW AND STRAW MANUFACTURES. Straw is the generic name applied to the drued stems or stalks of certain creals, such as wheat, barley, cats and rye. The first use of straw was probably as bedding or floor coverings for manked or as fodder and latter for cattle. The value of straw for cattle was early recognized, for im making conditions of land tenure, it was, and still is, customary to prohibit the removal of the straw residue which, as litter, became the only fertilizing agent. Thatching to primitive shelters and body coverings for man were some of the succeeding utilization adventoments.

Straw is now the raw material of many important industries, viz., mat-making; the stuffing of bedding; the weaving of hats, plats and baskets; twisting into ropelike bands for tying up sheaves and trusses of corn and hay and for rolling into "skeps" or beehives; for various methods of ornamentation; for the making of pulp for paper and the species of carriboard known as strawboard and the making of "envelopes" for the protection during transit of glass and earthenware. The two most important of the control of t

In the plait and hood industry throughout the world, cereals are specially grown and carefully selected for good colour, length, lightness in weight and toughness. Certain soils are necessary for the growth of straw fulfilling these requirements. These are found in Bedfordshire, Buckinghamshire and Hertfordshire, in England, Tussany in Italy, on the eastern seaboard of China and in nearly all parts of Japan. These various centres employ different means of cultivation and of treatment of the stalks after growth. In England the wheat crop destined for plait is carefully mown by hand with a stickle or sychych, the stalks when thoroughly ripened are tied up, just below the ears, into small sheaves, the loose leaves at the knots are removed by means of a special comb, leaving only the pipes of the straw, which are finally cut up into suitable lengths between the knots.

In Tuscany, before the grain is fully ripened, the stalks are pulled up by the roots and spread out to be dried and bleached in the sun. The upper part of the stalk down to the first knot, being exposed to the elements during growth, develops a colour known as "Tuscan" and is termed panta or point. This part of the straw is used for making the well-known "Legborn" hats, as well as for plaits of many designs under the generic name of "fuscan." The plaits of many designs under the generic name of "fuscan." The

lower portion of the stalk, when denuded of its sheath, is of a pearly white colour and is called the peddle or foot. This is lighter in weight than the panta and is utilized for hats and plants of high quality under the name of "Pedal" China and Japan follow these methods as the nature of the straw or the soil may recurred.

Varieties of Straw Hats .- Straw hats comprise (1) those made of plants sewn in overlapping 10ws either by hand or machine, (2) those woven like a basket called hoods, (3) those, like the "Leghorn," which are made of plants laid edge to edge These last have, for fixing the rows of plant together, a fine cord threaded through the loops resulting from each bend of the strand of straw at the turn of the pattern, which when tightened interlocks the rows in such a manner as to conceal the cord entirely. forming when finished practically a flat surface, while the sewn hats, having each row overlapping the next with the stitch taken through, present a fuller and richer appearance. Hoods are woven in various "wattle" and "crisscross" patterns of plain or fanciful nature. All methods commence at the centre of the top of the crown and the starting spiral or knot is termed the "button" In addition to the "Panamas" and "Brazilians," there are the Yedda, Hemp, Raffia, Bowen, Buntal Rush, Java, Bankok and Manila hoods which, although in the plait and hat trade are called straws. are of other vegetable fibres. They are all of exotic growths: the well-known "Panama" derives its name from the locality from which it was first exported 300 years ago; the area of its production has since greatly extended, Ecuador and Colombia being now important centres of manufacture The names of Bankoks, Brazilians, Javas and Manilas announce their source, yeddas and bowens come principally from Sumatra, rush hats are made in China: raffias come from islands of the Caribbean sea, and hemps from Switzerland, Italy, China and Japan. Synthetic braids are made mostly in Switzerland. The principal variety, "Neora Split," is a combination of cellophane and ramie, an Asiatic grass boiled into a fibrous substance Another has cellulose or gun cotton for its base, as have synthetic straw bodies

The making of plaits or braids for sewing to shape is of much more recent origin than the weaving of hats or hoods and this development was introduced into Scotland by Mary Queen of Scots in 1752. After the accession of her son, James I, to the English throne, the industry migrated toward the south and settled in the district between Dunstable (Bedfordshire) and Hemol Hempstead (Hertfordshire) in the early days of the 17th century. From that date hats and bonnets were all made or sew by hand until 1870, when the first hat was machine-sewn in Luton (Redfordshire).

Many machines have been invented for the sewing of plait, of which only three varieties are now extensively in use. The 1870 type machine, greatly improved, has a visible stitch similar to that of an ordinary domestic sewing machine; another type, subsequently invented, has a specially designed inchanism by means of which the concealed stitch of handsewing is closely imitated; these produce the overlapping row result, but in the third and latest machine a zig-zag stitch provides for the sewing of plaits edge to odge

The sulphur and acid processes, for long the only methods of bleaching straws, have been replaced by the use of "electrolytic hydrogen peroxide," by which all tones of white, from paper to ivory, can be obtained. In like manner, the old-time logwood fustic, sumes, opperas and other similar dyestuffs have been superseded by aniline and alizarine processes. Hats and hoods are stiffened with gelatine size, and after drying are blocked into the required shape with the aid of damp heat and pressure, either by hand or by hydraulic or vacuum machines. (H. I.; X.)

STRAWBERRY, well-known fruit-plants of the genus Fraguria. Native of the temperate regions of the old and new world, as well as of mountain districts in warmer regions, one species is also found in southern Chile. The common cultivated varieties were derived by bybridizing the meadow strawberry (Fraguria wirginiana). of eastern North America with the beach stawberry (R. okidensis), native from Alaska to central California, the coast: of southern Chile and the mountains of the Hawaiann Islands. In 1943, Early Cheyenne, Cheyenne X, and

Cheyenne 2 varieties were introduced, all three hybrids of cultivated varieties with a third species, P ovalis (fomerly P cimerfolia), a native of western North America from New Mexico to the Pacific and north to Alaska P vesca, the fourth species, is crummolar and is now (or nossibly indipenous) in the mountains

of the West Indies, Mexico rather fragile woodland species. lacking the vigour of garden strawbernes. The "alpine" varieties are everbearing selections of F vesca from the mountains of northern Italy Though the fruit of the alpines is much smaller than that of the common cultivated varieties, it is highly aromatic In several varieties it is fairly common in European gardens but is rare in America The alpine varieties come true to seed in contrast to the great diversity of the seedlings raised from seed of ordinary garden varieties A few varieties of F. moschata, a fifth species native to central Europe are also raised in European gardens Its berries are vinous

gardens Its bernes are vinous manufactured and the most aromatic of all However, the plants are only moderately productive and the bernes are small in size a Milied to P sesse are two other rather distinct species, P, milger-ressis of southern Asia and P wirids of Central Europe, both have usual and eupromising fruit. The so-called Indian straw-production of the most productive production of the productive production of the productive production of the productive productive production of the productive productin

Before the white man reached America the Indians of Chile had selected and were cultivating native strawberries that bore fruit of exceptional size—"as large as a walnut." The berries were pale red with firm, meaty, almost white flesh and a delicate aroma. In 1714 M Frezer took to Europe five plants of this Chilean strawberry. Plants of the North American meadow strawberry were already growing in European gardens, and from crosses of these two the modern strawberry evolved. Varieties grown in North America originated there while most of those grown in Europe originated there while most of those grown in Europe originated there (Huxley = Ettersburg 80 is the chost exercision.)

In the United States the acreage in strawberries averages about 18,0000 acres with a croy value of about \$3,000,000. It is grown in every state of the United States and in most provinces of Canada on a wide range of soil types, from sand to day. In all except sections near the Gulf coast and on the Parlic coast the plants are usually set in early spring 10 3 ft, apart in rows 3 ft, distant and fruit the following year. Near the Gulf coast plants are sti nthe fall and fruit during the following winter or in eirly spring. On the Parlic coast plants are

Duing the summer runners grow from the original plants and form new plants at their tips. By fall a matted bed of plants will have formed. Fruit buds form in the crowns of the plants in the fall. These develop into flowers and berries the following spring. Because of the warmer winter and the short days from eastern North Carolina west to Louisana and southern Texas fruit buds form all winter and into the spring, resulting in a second crop of fruit following the first crop. Plants formed late in the fall or crowded in dense rows so that they have only two or three leaves may bear five to ten berries in the spring. If the plants are formed early in the summer and are well spaced so that they have 20 or more leaves they may bear as much as a quart the following spring. To obtain such large plants the original mother

plants set 2 ft apart in the row may form five runner plants include glass bottles, clothing, food, agricultural implements, fursnaced about 12 in apart or eight runner plants spaced 8 in apart All runners after these have rooted are cut oif The larger the plant in the fall the greater the crop the next spring, and runner restriction, use of fertilizers, irrigation or any other cultural practice to increase the size of the plant in the fall will increase the next year's crop

The strawberry is only a half-hardy plant and may be badly injured by temperatures of 10° to 15° F in the fall and winter. For this reason the plants are covered with r to 6 in of wheat straw or other mulching material before temperatures as low as 15° F occur One inch of straw is sufficient from Maryland to Kansas, 2 in. from New England to Illinois, and 3 to 6 in in Wisconsin. Iowa, Minnesota and northward

In 1943 less than 20 varieties constituted 95% of the acreage in the US Important varieties were Missionary in Florida; Klonmore in Louisiana, Blakemore from Maryland to Oklahoma south to 100 mi from the Gulf of Mexico, Klondike near the south to too in Missouri, Kentucky and southern Illinois and Indiana, Dorsett, Fairfax, Chesapeake, Joe and Lupton from the eastern shore of Virginia to southern New York and New England: Howard 17 (Premier), northern New Jersey to Canada and

west to Minnesota; Dunlap and Beacon in Wisconsin, Iowa and Minnesota, and Marshall on the Pacific coast

Everbearing varieties differ from others in forming fruit buds in the long days of summer at relatively high temperatures They are adapted to northern sections with cool summers, as from New Jersey and New England to Iowa and Munesota and northward Rockhill, Gem and Green Mountain are good everbearing varieties for the U.S. and Canada.

Serious diseases are the leaf spots, red stele root disease, spring and summer dwart (due to nemas), fruit rots and virus diseases. Serious insects are the bud weevil, root weevils, crown bores, cyclamen mite, leaf roller, white grubs and the red-spider mites

In England and Wales the acreage was 26,750 in 1935 In Scotland about 2,000 ac and in Ireland about 1,000 ac, are grown Kent county is the largest producer in England, with nearly onethird of the entire acreage of England Hampshire, Cambridge and Norfolk counties also have large acreages. Plants are set in the spring or autumn 12 to 15 in, apart in the rows with the rows 30 in distant. Paxton is best on heavy soil, Royal Sovereign on lighter soil and Jucunda on peaty soil. The fields may be kept till the fourth year but not usually more than that long.

See "Strawberry Improvement," U.S. Department of Agriculture Yearbook, 1937

STRAWBERRY-TREE (Arbutus unedo), a beautiful ornamental tree of the heath family (Ericaceae, q v ), native to southern Europe and also to southwestern Eire (Keiry), and widely planted in warm countries. It grows from 10 to 30 ft. high and has smooth red bark, which peels in thin plates, and oblong, glossy, dark-green leaves The white or rose-coloured flowers, arranged in short, drooping clusters, are borne in autumn intermingled with the scarlet granular berries, about \$\frac{1}{4}\$ in. across, which ripen only the second season after flowering. (See MADROÑO)

STRAWBOARD: SEE CARDBOARD.

STRAW HATS: see STRAW AND STRAW MANUFACTURES. STRAYS, a term used in radio to denote electromagnetic disturbances in reception other than those produced by radio trans-

multing systems STREATHAM, a large residential and shopping district in south London, England, within the municipal borough of Wandsworth and the parliamentary division of Wandsworth Streatham. The common is 67.75 ac. in extent and rises to about 250 ft. Streatham park, which was, until pulled down in 1863, on the south side of Tooting Bec common, was often visited by Samuel Johnson when Henry Thrale lived there.

STREATOR, a city of La Salle county, Illinois, U.S.A., on the Vermilion river, 90 mi. S.W. of Chicago. It is served by the Burlington Route, Gulf Mobile and Ohio, New York Central, the Atchison, Topeka and Santa Fe and the Wabash railways. The population was 16,469 in 1950 and 14,930 in 1940 by federal

niture and truck bodies The first settler in the immediate vicinity came from Virginia in 1831. About 1860, after coal had been discovered, a village grew up along the bluff (called Hard Scrabble and later Unionville) and in 1866 the Vermilion Coal company (whose president was W L. Streator) began mining on a large scale The town was planned in 1868, incorporated in 1870, and in

1882, when the population was about 6,000, was chartered as a city. STREET, ALFRED BILLINGS (1811-1881), U.S. author, was born in Poughkeepsie, NY, Dec. 18, 1811 He was educated at the Dutchess county academy until 1825, when his family moved to Monticello, NY. After that time he studied law with his father, the district attorney of the state. He practised law in Monticello and later in Albany but was never devoted to the profession and in 1848 abandoned it to become state librarian, a position he held for many years. He also served for a time as state law librarian Although Street wrote both poetry and prose, he is far better known as a poet than as a prose writer. Most of his verses treated of the history and the natural beauties of New York state and he was particularly praised for his descriptive passages He wrote The Burning of Schenectady, and Other Poems (1842), Drawings and Tintings (1844); Frontenac, or the Atotarho of the Iroquois (1849), Woods and Waters (1860), The Indian Pass (1860); and several other volumes, as well as a number of single poems which were printed in contemporary periodicals The Poems of Alfred B. Street appeared in 1845 His "The Settler," "Lost Hunter" and "The Gray Forest Eagle" a perhaps his best single poems He died in Albany June 2, 1831

STREET, GEORGE EDMUND (1824-1881), English architect, was born at Woodford in Essex on June 20, 1824, and died on Dec. 18, 1881 He was the third son of Thomas Street, solicitor. He was educated at Mitcham and at the Camberwell collegiate school. In 1841 he became a pupil of Mr. Owen Carter at Winchester. Afterward he worked for five years as an "improver" with Sir George Gilbert Scott in London and in 1840 began to practise on his own account. At an early age Street became deeply interested in the principles of Gothic architecture. and studied the finest examples of mediaeval buildings in England and on the continent. His first commission was for the designing of Biscoray church, Cornwall In 1840 he took an office of his own. He was a draughtsman of a very high order, and his sketches are masterpieces of spirit and bulliant touch In 1855 he published a careful and well-illustrated work on The Brick and Marble Architecture of Northern Italy and in 1865 a book on The Gothic Architecture of Spain, with beautiful drawings of

Street's personal taste led him in most cases to select for his design the 13th century Gothic of England or France, his knowledge of which was very great, especially in the skilful use of rich mouldings. By far the majority of the buildings erected by him were for ecclesiastical uses, the chief being the convent of East Grinstead, the theological college at Cuddesden and a large number of churches, such as St Philip and St. James's at Oxford, St. John's at Torquay, All Saints' at Clifton, St Saviour's at Eastbourne, St. Margaret's at Liverpool and St. Mary Magdalene, Paddington. His largest works were the nave of Bristol cathedral, the choir of the cathedral of Christ Church in Dublin and, above all, the new courts of justice in London The competition for this was prolonged, and much diversity of opinion was expressed. Thus, the judges wanted Street to make the exterior arrangements and Barry the interior, while a special committee of lawyers recommended the designs of Alfred Waterhouse. In June 1868, however, Street was appointed sole architect. The building was not completed at the time of his death.

Street was elected an associate of the royal academy in 1866 and R.A. in 1871. At the time of his death he was professor of architecture to the royal academy, where he had delivered an interesting course of lectures on the development of mediaeval architecture He was also president of the Royal Institute of British Architects. He was a member of the royal academy of Vienna, and in 1878, in reward for drawings sent to the Paris excensus. Coal mining was formerly important; industrial products hibition, he was made a knight of the Legion of Honour. He was buried in the nave of Westminster abbey

STREET CRIES. The stinerant vendor has always adopted a distinctive cry to draw attention to his wares, and, as a French writer says, the origin of these cries "se perd dans la nuit des temps." The earliest record possessed in English is that given in the New English Dictionary of a cry of 1393 "Kokes and here knaues crieden hote pyes hote"-a cry which with but slight variation was preserved to the close of the 18th century The earhest collection of street cries is to be found in the 14th-century poem London Lackpenny The author of this poem is, on John Stow's authority, John Lydgate (1370-1450), a Benedictine monk of the abbey of Bury St. Edmunds Among the many cries included are those of "Hot peascods," "Strawbernes ripe and cherries in the rise" Pammelia: Musicke's Miscellanie was published in 1600-18 and contains a number of cries, but the most important collection of the time is P Tempest's The Cryes of Old London (1668), a work with which Samuel Pepys was familiar In Smollett's Humphrey Clinker it will be recalled that the author protests against "noisy rustics bellowing 'green peas,'" and Herrick long before had introduced stray street cries in his Hesperides. The cnes of Paris are of very remote origin and Le Livre des Mestiers contains examples of the time of Saint Louis; Guillaume de la Villeneuve compiled a famous collection known as Les Crieries de Paris As in London and elsewhere the incunabula of the street cries of Paris are rich in pictorial illustration, and the old collections provide a perfect mirror of the times. Every town possesses its distinctive cries, but, save when there are enthusiasts such as A. Carracci (1560-1609), who preserved those of old Bologna, these are hard to come by

STRELITZ (STRVELETS), a body of Russian household troops orignally rased by the tsat Ivan the Terrible in the middle of the 16th century. They numbered 40,000 to 50,000 mfantry and formed the greater part of the Russan armies in the wars of the 16th and 17th centuries. They were a fietce and ill-disciplinable in peace. Their mutnies were frequent and dangerous, and at last, in 1683, an unusually serious outbreak led Peter the Great to compass the abolition of the force. The Streitis were gradually drawn to the western frontier of Russia, and in 1658 they rose in mutiny for the last time. Crushed in battle by Peter's general Patrick Gordon they cessed to exist as a military force, and about 2,000 of them who fell into the hands of the tsar were barbarously tortured and put to death.

STREPTOMYCIN is an antibiotic substance produced in cultures of Strephonycer gristes (Actanomyces gristes). It was first described by A. Schatz, E. Bugge and S. A. Waksman in 1944 Of greatest use in the treatment of tuberculous, streptomycin inhibits the multiplication of susceptible bacteria or kills those bacteria, depending upon the concentration of the drug achieved in the blood stream of the patient. The drug has only a local reaction in the gastroinestunal tract if ingested. For systemic action it is given by injection into muscle tissue, from where it is rapidly absorbed into the blood stream Tuberche bacilli can become resistant to streptomycan during a single genetic mutation. Other drugs may be given concurrently to related this phenomenon.

Other drugs may be given concurrently to retard this phenomenon.

Streptomycin may cause vertigo (dizziness) or loss of hearing or both after prolonged treatment.

Although the chemical formulas are known, the drug is not synthesized. It is produced by growing the mould in suitable media and isolating the antibiotic by physicochemical methods.

3. A closely related antibiotic, dihydrostreptomycin, is produced

2'A closely related antibiotic, dihydrostreptomycin, is produced by the chemical addition of hydrogen to streptomycin. Its antibiotic action and toxic effects are very similar to those of streptomycin.

"See monograph in American Medical Association, New and Nonoficial Remedies (1952). (Ws. H. B.)

STRESA, a village of Piedmont, Italy, in the province of

Novara, situated on the west side of Lago Maggiore, on the Simplon iallway, 10 mi N of Arona, 673 ft above sea level Pop (1951) 4,574 It is noted for the beauty of its scenery and its fine villas and is a health resort

STRESEMANN, GUSTAV (1878-1929), German stateman, was born in Berlin on May 10, 1878. He was educated at the Berlin gymnasum and at the universities of Berlin and Leipag where he studied philosophy and political economy. A liberal and a radient patition the drew his political inspiration from Baron H F K vom und zum Stein, from Prince K A von Hardenberg and Rudolf von Bennigson. He was a love of art and interactive These early interests and ideals he maintained throughout his life At the age of 28 he entered the Retchstag On the death of Ernst Bassermann in 1917 he became leader of the National Liberal party

During World War I be urged a more vigorous mobilization of the national effort, and he helped to bring about the fall of T von Bethmann-Hollweg whom he accused of weakness and indecision After the revolution he tried to form a united Liberal party. When this failed he became leader of the new German People's party which represented the right wing of the old National Liberals Although he was himself a monarchist he fully accepted the republican constitution of Weimar. He had always been in favour of responsible parliamentary government. He hoped that his party would form a bridge between the old and the new Germany He condemned every kind of intransigent opposition and afterward made repeated efforts to induce the German National party to take part in the responsibility of government. In 1919 he voted against ratification of the treaty of Versailles which he believed to be unjust and unworkable. But once the decision was taken be thought that Germany must accept the consequences, it was powerless and disarmed; recovery could be achieved only if the treaty were revised by agreement The Franco-Belgian occupation of the Ruhi in 1923 was, he held, a crass infringement of the treaty intended to bring about the economic rum and dismemberment of Germany, He was at first a strong supporter of passive resistance

In Aug 1923 Stresemann became chancellor and foreign minister at the head of a "grand coalition" of all parties from the Social Democrats to the German People's party. The separatists, who were encouraged by the French in the Rhineland, the Communists in Saxony and Thuringia and the right-wing extremists in Bayaria threatened the unity of the reich The collapse of the mark made normal economic life impossible. Stresemann therefore decided to end the passive resistance. The reform of the currency was achieved by Hans Luther, and by Hjalmar Schacht, who was Stresemann's personal choice. The reichswehr under emergency decree, took strong measures against the Communistcontrolled government of Saxony and, after the Hitler-Ludendorff Putsch, they restored order in Bavaria The Social Democrats resigned because they considered the action against Saxony unconstitutional. Stresemann fixed to start negotiations with France but his overtures were rejected by Raymond Poincaré. The cabmet fell in December.

net rein in December.

Stressmann remained foreign minister He served in a series of coalitions under Wilhelm Marx (centre), Luther (nonparty) and Hermann Müller (Social Democrat). At the London conference in 1924 he accepted the report of the Dawes committee on replanation of the London conference in 1924 he accepted the report of the Dawes committee on replanation of the London on the London conference in 1924 he accepted the report of the London of the Cornel of the Cornel of London of the Cornel o

In 1925 Stressmann, encouraged by the British ambassador Lord D'Abernon, took the initiative in seeking a political settlement between Germany, France and Great Britism. These negotiations culminated in the Locarno pact (q:0). Stressmann had become convinced that there was no real conflict of interests between France and Germany and that, once the French demand for security had been satisfied, fruitful co-operation in political and

economic matters would be possible. In face of great difficulties he maintained his belief that Aristide Briand would loyally support this policy In 1926, after Germany's entry into the League of Nations, he held private conversations with Buand at Thorry They discussed the possibility of the evacuation of the Rhineland and the return of the Saar and of German financial assistance to France

Stresemann's hopes for revision of the territorial clauses of the treaty of Versailles remained infulfilled. In 1020 he accented the Young plan which was intended to be a final settlement of reparations The Allies agreed to evacuate the Rhineland in 1030. Stresemann carried his policy in the Reichstag, in spite of strong opposition from the Nationalists and Communists Schacht, who had been the chief German expert on the Young committee, turned against him on the grounds that he had won meagre concessions in return for financial obligations which could not be fulfilled.

In 1026 Stresemann signed a treaty of neutrality and friendship with the U S.S R He was anxious that Germany's entry into the League of Nations should not lead to a break with Soviet Russia In the published sources there is no indication that he favoured an eastern in preference to a western policy. Nor is there any evidence that he ever envisaged a departure from the methods of peaceful negotiation. He came to identify the interests of Germany with the interests of Europe as a whole. He was awarded the Nobel Peace prize in 1926. He died in Berlin on Oct 3, 1929

STRETFORD, a municipal borough in the Stretford parhamentary division of Lancashire, England, contiguous to Manchester and Salford on the southwest It is on the Bridgewater canal and contains a considerable part of the Trafford park trading estate (next to the Manchester Ship canal) and Old Trafford, the Lancashire cricket ground. The town hall and a technical college are in the civic centre. Pop (1951) 61,532. Area 5.5 sq mi. The two manors of Stretford and Trafford have, since about 1260, descended in the family of Trafford, the borough was incorporated in 1933. The name of the town (Street-ford) refers to the crossing of the Roman road from Chester to Manchester and the River Mersey

STRETTO (It. Stringers, to pull close), musical term signifying the device in fugal writing whereby subject and answer are brought closer together and thereby made to overlap, the one beginning before the other is ended (See Fugue.)

The term signifies also an increase in tempo toward the end of a passage. This effect is to be found chiefly in Italian opera.

STREUVELS, STYN (1871- ), pen name of Frank Lateur, Flemish writer, and the nephew of the priest-poet Guido Gezelle. Essentially a man of the soil, he nevertheless possessed a delicate artistic sensibility and acquired considerable literary culture. He was the most popular writer of his time in Flanders and enjoyed a great reputation in Holland, although he frequently introduced the Western Flemish dialect into his writings Many of his novels were translated. De Vlaschaard (The Flax Field, 1907) is considered one of his best works.

STRICKLAND, AGNES (1806-1874), English historical writer, was born in 1806, the third daughter of Thomas Strickland, of Reydon hall, Suffolk. Her first literary efforts were historical romances in verse in the style of Walter Scott-Worcester Field (published without date), Demetrius and other Poems (1833). From this she passed to prose histories, written in a simple style for the young. A picturesque sketch of the Pilgrims of Walsingham appeared in 1835, two volumes of Tales and Stories from History in the following year. Then, with the assistance of her sister, she projected a more ambitious work, The Lives of the Queens of England, from Matilda of Flanders to Queen Anne. The first volume appeared in 1840, the twelfth and last in 1849, Miss Strickland was a warm partisan on the side of royalty and the church, but she made industrious study of "official records and other public documents," gave copious extracts from them and drew interesting pictures of manners and customs. While engaged on this work she found time in 1843 to edit the Letters of

Mary, Queen of Scots, whose innocence she championed with enthusiasm In 1850 she followed up her Queens of England with the Lives of the Queens of Scotland, completing the series in eight volumes in 1859

Uniesting in her industry, she tuined next to the Backelor Kings of England, about whom she published a volume in 1861. The Lives of the Seven Bishops followed in 1866 after a longer interval, part of which was employed in producing an abridged version of her Queens of England. Her last work was the Lives of the Last Four Stuart Princesses, published in 1872. In 1871 she obtained a civil-list pension of £100 in recognition of her merits She died July 8, 1874

A Life by her sister, Jane Margaret Strickland, appeared in 1887. STRICKLAND, WILLIAM (1787-1854), U.S architect and engineer, was born in Philadelphia, Pa, in 1787. He first became known as an artist, although he studied architecture under Benjamin Latrobe. In 1810, however, he designed the Masonic hall in Philadelphia and was thus well launched as an architect. Although the hall was Gothic in design, Strickland later turned to the classic Greek style, and his next important work, the United States bank in Philadelphia, took the Parthenon for its inspiration Strickland also designed the Merchants' Exchange building, the United States Naval asylum, the United States mint and the United States custom house, all in his native city and Washington's marble sarcophagus at Mount Vernon

His engineering projects were nearly as well known as his architectural In 1825 he was sent to Europe to study internal improvements and on his return did much to encourage the construction of the original line of the Pennsylvania Railroad company, one of the first designed to carry passengers in the United States. He also constructed the Delaware breakwater, a commission he received from the US government. At the time of his death he was in Nashville, Tenn, superintending the construction of the state house, which he designed and which is regarded by many as his best work. He died in that city April 7, 1854, and by a special act of the state legislature was buried in the building

He was the author of several technical publications relating to engineering and architectural projects which he headed; author of Reports on Canals, Railways, Roads and Other Subjects (1826). the report he made on his return from Europe, and, with two others, of Reports, Specifications and Estimates of Public Works in the Unsted States (1841).

STRIGIDAE: see OWL

STRIKES AND LOCKOUTS. Strikes (often called turnouts or sticks in the early 19th century) are concerted refusals to work under the conditions required by employers. Lockouts, strictly speaking, are occasions on which employers close their establishments against their employees until they accept the terms offered them; but the word lockout is often used, especially by workers, to cover occasions on which the employer attempts to worsen the terms of employment and the workers abstain from work in protest Lockouts in the strict sense became uncommon in the first half of the 20th century; formerly they occurred especially when an employer or group of employers was attempting to ban union membership and refused employment to workers who would not sign a pledge not to belong to a trade union. Later they arose most often when a body of employers retaliated against a strike at a particular works by closing all factories until the str'kers returned to work. When the word lockout is used in its wider sense the distinction between it and a strike is often hard to draw, and workers will describe as a lockout what the employers call a strike. Statistically, no separation can be made, and strikes and lockouts are lumned together under the heading of stoppages. or trade disputes.

## EUROPE AND BRITISH COMMONWEALTH

Types of Strikes and Lockouts.-Strikes (and lockouts) can be classified into a number of types. The simplest is the normal type of trade dispute turning on a difference about wages or conditions of employment, or about some special issue of discipline or trade union practice, when the strikers (or lockers-out) are the parties directly involved. Sympathetic strikes or lockouts are those in

which a part is taken by persons or associations not directly involved in the original dispute, but striking or closing their establishments in sympathy with one of the original parties. What are called general strikes may be either very extensive sympathetic strikes or concerted stoppages over a wide range of industries for a common object. The political general strike belongs to the latter type, it can be either a mere protest stuke, called for a single day or for a limited period, or a strike designed to last until it has achieved its purpose or failed, as in the German general strike against the Kapp Putsch of 1920. The British general strike of 1926 was simply an extended sympathetic strike in support of the Mmers' federation, whereas the threatened strike of 1920 against British participation in the Soviet-Polish war belonged to the same type as the strike against the Kapp Putsch. A special variety of strike, which may belong to any of the foregoing categories, is the sit-down or stay-in strike (stay-down, in mining) in which the strikers occupy their places of employment and either do no work or attempt to carry on production on their own account (as in the Italian stay-in strikes after World War I). The stay-in strike was extensively used in France in the 1930s at the time of the popular front and is also a familiar technique among native workers in colonial areas The general strike as actually practised has to be distinguished from the general strike as aspiration or "social myth"-sometimes called the social general strike, which is a mass strike of workers designed to bring about a social revolution and the establishment of a workers' society. Its earliest advocates were the anarchist-communists (see A, Roller, The Social General Strike, 1905); and the idea was taken up by the French syndicalists It was Georges Sorel, author of Reflections on Violence and other books of syndicalist theory, who introduced the idea of the general strike as a "social myth," inspiring workingclass revolutionary feeling and giving a heightened meaning to ordinary strike action, even if in practice it never occurred. The French syndicalists also introduced the conception of la grève perlée (sometimes anglicized as "the strike with knobs on") by way of contrast with la grève aux bras croisés-the former being accompanied by acts of sabotage or violence.

Official and Unofficial Strikes .- Strikes may be either spontaneous or organized A great many strikes have begun as spontaneous reactions by a group of workers to a particular grievance, such as the dismissal of a fellow-worker whose "victimization" for trade union activity was suspected, or the employment of unskilled workers on jobs normally reserved for skilled workers, or the cutting of a piecework price, or any of a hundred other things. Such sudden strikes may become organized subsequently, if a trade union takes them up, or sometimes if the strikers throw up leaders of their own. Strikes may also be either official or unofficial. they are official when they are called or approved by a trade union, which takes control of the proceedings and of any negotiations designed to settle them; unofficial strikes are either strikes apart from trade unions, or strikes called by trade union branches or districts without the support of the union as a whole in accordance with its rules. Since in many countries, organized national collective bargaining has been introduced into most industries and collective agreements have laid down procedures to be gone through before an official strike can be called, an increasing proportion of all strikes tends to be unofficial-for example, a group of workers, tired of waiting to have its grievance dealt with by often dilatory negotiating procedures, strikes contrary to the provisions of a national or other collective agreement. The proportion of unofficial strikes is also increased when laws have been passed either forbidding strikes or imposing a compulsory period of delay for investigation before they can be lawfully called (the Lemieux system, used in Canada, and called after its proposer, Rodolphe Lemieux). Groups of workers will often dare to strike "against the law" when trade unions, fearful of having their funds attacked or their recognition by the state suspended or removed, hesitate to endorse a strike and so make it official.

The Law Relating to Strikes and Lockouts.—The law relating to strikes and lockouts has varied greatly from country to country and from time to time. When there is no industrial conscription or compulsory labour, a man is free individually to with

draw his services without penalty, provided that he works out the period of notice stated or implied in his contract. When long contracts are allowed, this right may be greatly limited, and so it may be where there are laws, as there used to be in many countries (in Great Britain up to 1867), against "leaving work unfinished" Moreover, the laws relating to "breach of contracti" differ widely

In Great Britain it used to be a criminal offense for a workman to break a contract of service, and imprisonment or fine was the penalty, whereas a master breaking his contract could only be sued civilly for damages Only in 1875 were employers and workers in Great Britain in normal cases made equal parties to a civil contract; and even in the middle of the 20th century exceptions remained so that a strike in essential public services or in circumstances which endanger life or valuable property could, if it involved breach of contract, render a striker liable to criminal prosecution Usually, however, breach of contract gives rise only to a civil action. Breach of contract is, of course, an individual matter between an employer and a single workman. Trade union collective agreements in Great Britain are not contracts enforceable at law, though they can be invoked in establishing implied terms of individual contract (the "custom of the trade") In Great Britain, except under wartime regulations, there have never been any penalties for breach of collective agreements, even where agreed or even compulsory reference of disputes to arbitration has been in force. In other countries which applied compulsory arbitration, there have often been penalties against trade unions which have called strikes contrary to law-the most usual being the withdrawal of recognition from the offending union so as to prevent it from bringing cases before the arbitration court, with the result either that a rival union can supplant it or that there remains no lawful way of pressing the case of the workers concerned

In Great Britain, the Trade Disputes and Trades Unions act of 1927 (passed after the general strike, but repealed by the Labour government in 1946), created a special category of illegal strikes and lockouts (in which it was unlawful for trade unions or employers' associations to engage) and laid down a procedure of injunction for determining the illegality in any particular case, but this provision was never in fact used. In totalitarian countries strikes have usually been forbidden altogether, and severe penalties laid down against their inciters. In countries where personal freedom is recognized as a basic principle the question of legality is more difficult. If an individual is free to withdraw his labour, subject to not breaking his contract, what can make it unlawful for a number to do the same? The law courts used to answer this question by invoking the common law notion of conspiracy in restraint of trade, under which concerted action could render criminal what it would be fully lawful for one man to do This was the legal doctrine under which strikes were held criminal, or usually held so when a case came before the courts, up to 1700, when a general act (amended in 1800) was passed forbidding all forms of working-class combination. Thereafter, until 1824, all strikes working-class combination. Thereafter, until 1824, all strikes could be treated as criminal either under the Combination acts or as conspiracies at common law to violate the Combination acts. These acts were repealed in 1824, and under a statute of 1825 strikes for a narrow range of purposes (wages, hours, etc.) were barely legalized, provided they involved nothing that the courts regarded as violence or intimidation As this latter term was not defined, legality remained highly precarious up to 1871, when the Trade Union act laid down that acts done by a number of persons in concert in pursuance of trade disputes were not to be regarded as criminal conspiracies-that is, that the mere fact of concerted action by a number could not, in such cases, constitute an otherwise lawful act a crime. Thereafter, in Great Britain, the legal right to strike seemed to be securely established, until it was challenged by the Taff Vale railway judgment of 1901, which decided that trade unions could be sued for damages arising out of their agents' actions. (See TRADE UNIONS.) This decision was reversed by the Trade Disputes act of 1906, which gave trade unions and their agents a wide immunity, making trade unions virtually unsuable in their industrial activities and giving a wide freedom from prosecutions for incitement to breach of contract in connection with trade disputes.

is, mainly, stationing representatives at the entrance to a works to warn off potential "blacklegs," but also, sometimes picketing the homes of such persons. A blackleg (or scab, or knobstick) is a worker who is prepared to work while other workers of the same group are on strike or locked out, he may be either a regular worker who refuses to join the strike, or a substitute brought in from elsewhere to help in breaking it Picketing is normally done by one or a few men, stationed at each point; but there is also mass picketing, which means assembling a large body of strikers to obstruct entry to the place of work. Much trouble arose over the legal aspects of picketing. In Great Britain peaceful picketing was authorized by statute in 1850, but the right was withdrawn in 1871, replaced only in a restricted form in 1875, fully restored in 1906 by the Trades Disputes act, drastically limited in 1927 by the Trade Disputes and Tiade Unions act, which wholly forbade picketing of a worker's home, and restored in the 1006 form in 1946

Political Strikes—Strikes have taken place from time immemoral They go back much further than trade unnos and still occur frequently among unorganized workers in the less developed countries without any trade union support They offen lead to the formation of permanent trade unions, as in the West Indies, in Brutish Africa and in many other places. In such areas it is often almost impossible to distinguish between stukes having industrial and strikes having political objects, for the two are often inextracibly mixed up. An instoncial parallel can be seen in the extensive British sixtles of 134s, known as the Ping plot These, political strikes for the enactment of the Poople's charter. There was a similar imaging of political and economic objects in the popular front strikes in Prance in 1936-193, and in the strike waves that accommanded the Russain revolutions of 1905 and 1917.

The Financing of Strikes—Strikes for industrial jumposes constitute the immense majority. When trade unions are behind them, there is usually strike pay (dispute benefit) unless the unions if fundar union ut When unions have only scartly funds; rether list had may be given instead of strike pay. This is common in the less advanced countries, and used to be common deswhere in earliers days. It is common for unions involved in costly disputes to re-ceve financial help from other unions, particularly where national trade unions have not developed, or have not accumulated large funds. One of the principal purposes of local trades councies has been to authorize appeals for help of this kind. The London Tindes councies for councied (1860) arose in this way, out of a temporary grouping formed to assist the London builders in their lockout of 1859. The London dock strike of 1858 and the porthesis coast inne-hours.

Picketing.—Strikes are often accompaned by picketing.—that, manily, statoning representatives at the entrance to a works with one potential "blacklegs," but also, sometimes preketing he homes of such persons. A blackleg (or scab, to knobstuck) me bomes of such persons. A blackleg (or scab, to knobstuck) me so is such persons. A blackleg (or scab, to knobstuck) memors in France and elsewhere. In some cases there are centra a worker who is prepared to work while other workers of the me group are on strike or locked out, he may be either a tegular thing, for example, is one of the main functions of the British order who relixes to join the strike, or a substitute brought is cleared. Federal red dearly on which from for finded buttons funded in 1891.

Statistics,-Statistics of strikes and lockouts are usually cal culated in terms of numbers of disputes involving stoppages o work, numbers involved, and numbers of working days lost No single measure is satisfactory. One big national strike involves more workers and days lost than a great number of small disputes and even a short national stoppage in a big industry outweigh: many smaller disputes in terms of numbers involved Still less satisfactory are the attempts to assess the results of strikes on a statistical basis by distinguishing between strikes won, lost and compromised So high a proportion of all disputes has ended in compromise that the figures show almost nothing, for compromise solutions may range from almost complete successes to barely qualified defeats. All that is effectively possible is a very broad measurement of fluctuations in strike activity from year to year After 1026 there was no year of considerable strike action in Great Britain, and the years after 1945 were remarkably free from disturbance in comparison with those after 1918 But only the broadest conclusions can be drawn from the available statistics. Table I shows the number of disputes, workers involved and working days lost in Great Britain on account of trade disputes from the inception of the returns in 1802

the inception of the returns in 1892. It will be observed that there was a much greater fall in the number of strikers and of working days lost than in the number of strikes. This is because many disputes dump. World War II and after were small and short unofficial stoppages in a single works or colliery or dock. Attempts are sometimes made to classify stoppages by causes—for example, wages, hours, recognition, work rules, etc—but the resulting statistics are of scant vialue, as more than one factor is often involved. Nor does the altempt to analyze methods of settlement yield valuable results: it would be much more important to know the numbers of disputes settled without stoppages of work by the vanous methods—for example, factor engotiation, conciliation, arbitration, etc.—but no statistics on this matter were available by the moddle of the soft ceatings.

Bautoomenw—Pre-1939 data are summaused in the I.LO. Fear Book of Lobury Schistics for 1939; but they are defective Reference to some of the puncipal strikes are given in the annual reports of the ministries of labour of the various countries. See also G. R. (Lord) Askwith, Industrial Problems and Disputes (1920); S. and B. Webb, Hastory of Irade Uniontine, were, et. (1920), Lord Amultee, Industrial Arbitration in Great Britism (1920), J. H. Richardson, Industrial Re-Organized Labour in Four Conditionents (1930); G. D. H. Cole, Morth History of the British Working-Class Movement, 1780—1947, rev et (1938), K. G. J. C. ## UNITED STATES

A strike of journeymen printers at New York, N.Y., m x,76 for an increase in wages is the earliest recorded strike in U.S. history. Prior to 1837 disputes were on a small scale for higher wages or the ten-hour day. The years 1835–37 saw "wuld-art" prosperity which saw the cost of living rus rapidly. To maintair their standards of living, workers organized trade unions and trades' unions (city centrals) to gain financial and moral support in their struggles for higher wages. While this "false" prosperity continued, the workers' demands tended to be granted, but th financial panic of 1837, with its consequent unemployment, mean defeat for the trade unions on the economic front.

After the Civil War, unionism took on a national character. This strike of nation-wide extent was on the Pennsylvania an Baltimore and Ohio railroads in 1877, at the depth of a prolonge depression. The Pittsburgh freight yards of the Pennsylvani railroad were burned and looted. State troops brought in from Philadelphia, Pa, because of the inaction of local authorities an the untellability of local state troops were forced to surrende free strike, which many feared might be the U.S. counterpart of

the commune of Paris, was quelled by the dispatch of units of Feb. 1913, an armed railway train machine-gunned a miners' tent the US army colony at night. A similar incident of industrial autogracy oc-

On May 1, 1886, approximately 340,000 workers went on strike in response to a call by the national trade union federation, which became the American Federation of Labor in 1886, to secure the eight-hout day. Explosion of a bomb in Haymanket square in Chicago, Ill., on May 4, 1886, supposedly by anarchists, and the consequent public clamour against radicalism and unmoism was blamed by Samuel Gompeis for arresting this promising move undicaterer. A revival of the demand for an eight-hour day occurred in 1890, when carpenters struck throughout the nation and were generally successful in achieving then objective

Skilled organized workers at the Homestead, Pa, plant of the Camege Steel Co in July 1892 refused to accept a wage reduction, and in the process gained the support of the unorganized workers Thereupon Henry C. Frick, general manager of the company, shut down the entire plant and refused to negotiate any further with the Amalgamated Association of Iron, Steel and Tin Workers, until then the strongest union in the world. As texthe issue settled down to one of continued union recognition, Frick imported strike breakers and armed guards. In the clash which ensued between the guards and strikers, several were killed on both sides. The strike ended in U.S. unionsm's most decisive defeat.

Organized labour's defeat in the American Railway union strike, or the so-ralled Pullman company boycott of 1804 was of another order. The union, young and weak, instituted a sympathetic strike to assist the Pullman local's resistance to a 25% wage cut. Violence and mass destruction of property occurred, centring in the Chicago yards. The railroad asked for federal intervention, and 2,000 federal troops were sent to Chicago. However, the strike was really broken by the issuance of nijunctions in the federal courts secured at the insistence of the attorney general of the United States on the basis of the Shreman Anti-trust law as one of the

grounds.

The successful strike of the bituminous miners in 1897 resulted in establishment of an agreement for the so-called central competitive field, with Illinois as the union's stronghold for decades

thereafter. The collective agreement, after an apparently hopeless strike begun with an empty union treasury, founded an "industrial government" based on reciprocal rights and obligations of both parties and pointed the way in all of the coal industry and

other industries as well.

In 1902, 150,000 anthracite miners struck to achieve a reduction of hours, an increase in wages and recognition of their union Violence occurred in areas where strikebreakers were hired to nune coal. To preserve order the national guard was sent to certain cities. As winter came, the situation grew worse, and Pres. Theodore Roosevelt intervened and arranged for arbitration. The miners won a roy mcrease in wages and a shorter working day, but their union was not recognized. The outstanding figure of this struggle was the miners' leader, John Mitchell, who sustained the hope of his polyglot following and won public sympathy by his moderation.

moderation. The next big strike was that of the coat and suit makers (women's) in 1970. It produced a second major pattern of industrial government, added to that of the soft-coal miners. Following a two months' strike in New York, a "protocol of peace" established a tripatite beard to settle differences between the manufacturers and the union under the agreement. Louis D. Brandels, later on the United States supreme court, mediated in the strike and devised a compromise in the "preferential union shop" in lieu of the closed shop visualy demanded by the union. This proved a major invention. A four-months' strike against Hart, Schaffner and Marx in Chicago stablished a similar pattern in the men's division. In this strike, as in the working of the agreement, Sid-willment, later a major leader in U.S. uniquosum, made his dobut.

Stable industrial government in the bituminous coal industry was, constantly menaced by nomunion competition. Continuous efforts were made by the United Mine Workers to organize the West Virginia, mines; but the operators, with state support, successing in repelling organization. Union members were evicted from company houses, and forget to live in tent colonies, and in Feb. 1913, an armed railway train machine-gunned a miners' tent colony at night. A similar incident of industrial autocracy occurred in Colorado In 1913–14 the national guard machine-gunned miners' tent colonies, and the miners retablated by killing mine guards and destroying mine property. Federal troops were called to bring order in April 1914, but the strike was not called off until December.

An attempt made to organize the iron and steel industry during and immediately after World War I was a major effort to response and proposed to the stress of the stress of the stress of the stress of the responded to a strike started in Sept 1919, but strike-smaller was employed extensively The men held out for six weeks at the cost of 18 lives, and then mass surrenders began

The New Deal.—With the New Deal, strikes began to evolve to the meature of diminishing violence because of a more considerate treatment of strikers by government and employers. Yet this may be said to date only from the "little steel" strike of 1937 and the La Follette committee investigation of demal of rights to

wage earners

A long-horeman's strike in San Francisco, Calif, m May 1934, developed into a general strike. Union recognition and control of the hiring halls, in essence the closed shop, and better wages and hours were the issues Serious rioting began when the employers attempted to operate the docks by force The California national guard was called out Labour became steadily more embittered, and in July sympathetic strikes started, and the principal highways into the city were closed. The general strike called on July 16 lasted four days, but the strike committee permitted the entrance of food trucks. The longshoremen's leader in this strike was Harry Bridges, subsequently known in Pacific coast and Hawanian industrial relations

To force "little steel" recognition of the Steel Workers' Organizing committee (C10) a strike was called in May 1937. The struggle was attended by considerable violence and, although 'big steel's' recognition of the Steel Workers' Organizing committee had occurred early in 1937, "little steel" (the independent producers) continued to resist unionization for a few more years

World War II and After.—Prior to Pearl Harbor two allegedly Communst-led strikes threatened to hold up the national defense program. In June 1941 leaders of the United Automobile Workers' local at the North American Aviation Co. in Inglewood, Calir., called a strike in violation of an interim agreement negotiated with the aid of the National Defense Mediation board. This unauthorized strike was proken through plant seizure by the government and a dispatch of troops. A strike at the Allis-Chalmers plant in Milwaukee, Wis (1941), crippled vital defense production.

Production losses caused by wartime strikes were relatively small except for soft-coal mining. An outgrowth of two strikes during 1943 was the Smith-Connally or War Labor Disputes act

With the termination of the no-strike pledge at the end of the ar came renewed industrial warfare. The restriction of wage war came renewed industrial warfare. increases during the war, fear of unemployment and some reduction in income because of "cut-backs," and the conviction that organized labour was to be subjected to a concerned employer attack created a favourable climate for widespread strikes. It was expected that the events of World War I and its aftermath would be repeated. In that war the wartime truce had been followed by a triumphant employer counterattack which not only "contained" unionism but regained most of the ground lost to management. Just as 1919 had seen a new record in the number of strikers, it was expected that 1946 might approach that record and possibly bring about a comparable defeat for labour. What happened was something entirely different prosperity held and the unions continued to gain in membership, notably in the newer of New Deal-sponsored unions

A number of the postwar strikes were industry-wide, and most of them of considerable duration. During the 12-mo, period following V-J day, work-stoppages resulted in almost 12,000,000 mandays of idleness Strikes were called in the oil, lumber, auto, steel, electrical manufacturing, med-packing, coal, rallroad and mantume industries. A strike by the United Automobile Workers against General Motors began in Nov. 1945 and continued until March,

1940 The leader of this strike, Walter Reuther, championed the business activity and sustained near capacity production levels had on consumers' cause as well as that of the strikers. He sourned any wage increase that might result in a rise of the prices of cars, but he was certain that the demanded increase could be met out of the corporation's accumulated profits This "public-minded" attitude proved somewhat embarrassing to Philip Murray of the Steel Workers union, whose members were equally pressing for a wage raise from an industry that did not have such profit reserves. The bituminous coal miners were on strike from April 1 to May 20. 1046, interrupted by a truce from May 13 to May 27 The railway trainmen and engineers struck on a nation-wide scale for two days in May 1046 but were defeated by Pres Hairy S Truman's radio appeal Smaller but equally crucial strikes were the tugboat and building employees' in New York, N.Y., and the public utility strike in Pittsburgh, Pa.

On the all-important wages question, the matter arranged itself in three "rounds" over 1946-48. Peculial to this period was the importance of "pattern settlements." The first settlement reached in a mass-production industry tended to set a pattern which all other industries accepted As the cost of living became stabilized, unions turned their attention to nonwage demands, such as employer-financed pension and social insurance programs. This

demand was stimulated by the mability of unions to break the "little steel" wage formula during the war and gained added momentum from an agreement signed in 1946 between the United Mine Workers and the government in which a health and welfare fund was set up to be financed by a contribution of five cents on each ton of coal mined From coal, "social security by contract"

spread to the other basic industries

The postwar years intensified the periods of industrial strife in the bituminous coal industry. Work stoppages were variously termed walk-outs, memorial holidays, stabilization periods and just plain strikes Since the industry was a "sick industry"—the coal demanded by the nation could be produced if the miners worked only three days a weekthe union assembled using national varieties and relational varieties and the control of the con wardly with a court order to resume work, but without actually do-

The steel strike of 1949 typified the new day in industrial conflict. The steel strike of 1949 typified the new day in industrial connuct. While the cost in dollass was great, the jails were empty. Not a cent was spent on strikebreakers, tear gas, not guns or arms of any kind There was no loss of human hie. This absence of violence, formerly so prevalent in US labour disputes, stemmed from the Wagner act, the state of the strike of the state of the strike of the state of the strike of the state of t the rise of a new kind of employer and a well-disciplined trade union membership

membersup
Following the outbreak of the Kosean war, the number of work stoppages increased sharply In 1950 there were 4,843 stoppages, as opposed
to 1948 with 3,665 stoppages The postwar peak occurred in 1946 with
4,985 stoppages The demand for wage increases came to the fereiront as unions proposed and obtained increases in anticipation of federal

labout-management relations This settlement influenced the peaceful conclusion of wage agreements made by the Chrysler and Ford com-panies with the UAW in 1950 Another important feature of labour-management relations after out-

break of the Korean war was the active participation of the federal government in the settlement of labour disputes

The Wage Stabilization board was authorized in April 1951 to investigate and recommend settlement in any dispute which was not resolved by collective bargaining or mediation, which threatened national de-fense, where the dispute was referred to the board by the parties inby ollective barganing or measurement of the board by the parties involved or by the president of the United States. In 1957, the president not be the president of the United States. In 1957, the president and transport coupment industion. Also in 1951, the president referred the important steel dispute to the board. The steel union demanded an hould by any Emergence and fringe benefits including shift premiums and holiday pay. The board recommended a wage increase was criticated by industry members because it threatened the anti-inflationary program of the federal government and it imposed a union shop on the modustry. The union issued a stike notice in April 1952 when shop on the modustry. The union issued a stike notice in April 1952 when seed shifts were search by the characteristic average the strike, the when negotiations broke down In an effort to avert the strike, the steel plants were seized by the federal government in April 1952 This seizuie was declared unconstitutional by the US supreme court in June 1952, and the president directed return of the mills to the owners Immediately following the return of the mills the steel workers went out on strike

out on STIKE

This steel strike lasted 54 days and was responsible for one-half
of the \$5,500,000 man-days lost in 1952 through work stoppages.
Steel production was not resumed until a new contract was signed
granting an hourly wage increase and some of the fringe demands
Following the wage increase the acting defense mobilizes ordered the Office of Price Stabilization to authorize increases in the price of basic

The government also participated directly in the settlement of two major railway disputes Following an unsuccessful attempt to settle an 18-mo. dispute between the rail carriers and the major railway unions the government prevented a walkout by seizing the railways in Aug. 1950 The dispute centred about the unions' demands for a 40-Aug. 1956. The dispute centred about the unions' demands for a 4,000 hour week for yard workers and rules changes for road service embour week. For yard workers and rules changes for road service embour was reached in Sept. 1950. The dispute with the trainmen order in May 1951. However, an agreement between the railways and the other operating unions was not reached for another year. Consequently federal operation of the railwads anded in May 1952.

sequently federal operation of the railloads ended in May 1952.

STRINDBÉRG, JOHAN AUGUST (1849/1912), Swedish dramatist, novelist and poet, born in Stockholm Jan. 22, 1849, grew up under poverty-stricken and unhappy conditions, and after a short period at Uppsala university, became a school teacher; then a wealthy doctor interested himself in Strindberr and undertook to complete his education in medicine. Strindberg first found his feet as a dramatist. He wrote Hermsone (1869), an ambittous tragedy in verse; and a one-act piece In Rom (1870) was performed. For a year or two he struggled as a journalist in Stockholm, until in 1874 he was appointed librarian in the Royal library. In these years he completed his first great play, Master Olof (Master Olof, 1874), with the Swedish reformer Olaus Petri, as its central figure, and Roda Rummet (The Red Room, 1879), a satiric novel suggested by The Pickwick Papers. Strindberg then wrote the dramas Gillets hemlighet (The Secret of the Guild, 1880), Lycko-Pers resa (Lucky Peter's Travels, 1880), and Herr Benets hustru (Str Benet's Wafe, 1882) In 1882-82 followed the splendid stories of Svenska oden och aventyr (Swedish Fates and Adventures), which established his fame. In 1875 he met Siri (Signid) Wrangel, the wife of an officer, and became entangled in a fateful passion, which after her divorce in 1877, ended in marriage After a year or two his love turned to suspicious hatred and the first signs of persecution mania showed themselves He had described his early life in the autobiography Transtekvinnans son (The Son of a Bondswoman, 1886); and his unhappy marriage is the theme of the revolting and self-lacerating En dares for sparstal (A Fool's Defence, 1893) His relations to Siri Wrangel colour all his imaginative work in this period. In the early 1880s he lived for a time in Paris and Switzerland, where his literary activity ranged from lyric poetry and satire to studies of the French peasant, and the masterly novels of Utobier 2 verkligheten (Realssed Utopias, 1885). With the stories and sketches of Giftus (Married, 1884-86) he launched an attack on marriage which involved him in a prosecution, resulting, however, in acquittal. The plays Fadren (The Father, 1887) and Froken Julie (Lady Julia, 1888) open a new phase in Strandberg's dramatic work, and form a landmark of importance in the history of European realism Similar plays followed, most of which turn around the author's own marital tragedy. But in those years he also wrote his greatest contributions to Swedish fiction, the masterly novels Hemsoborna (The People of Hemsö, 1887), and I Havsbandet (In the Outer Skerries. 1890) A very dark period followed. His marriage was dissolved in 1801; his misery was accentuated by money difficulties, and for a time he hovered on the brink of insanity. A second marriage with an Austrian lady, Frida Uhl, was even more disastrous than

The dark experiences of these terrible years found their precipitate in Inferno (1897), Legender (1898), and the great allegorical drama in three parts, Tull Damascus (To Damascus, 1898, 1904); to this period belong, too, Advent (1899) and the effective play Brott och brott (Crimes and Crimes, 1899). When reconvalescence set in. Strindberg returned to the historical drama and produced a long series of works of power and originality. the finest being perhaps Gustav Vasa (1899) and Gustav Adolf (1900); he also wrote a number of symbolic poetic plays, notably Ett Dromspel (A Dream Play, 1902) In 1901 appeared the engaging drama Påsk (Easter) and the masterly realistic tragedy Dodsdansen (The Dance of Death), the greatest of his harrowing marriage dramas. For the théâtre intime which he established in Stockholm he also wrote many short pieces, prominent among them Stocksonaten (The Ghost Sonata, 1007). Of the prose works of his last period may be mentioned Fagervik och Skamsund (Fairhaven and Foulsound, 1902) and Taklagsol (The Festival of the Finished House, 1906), which affords a glimpse into Strindberg's third marriage with the actress Harriet Bosse. In 1903 appeared the last volume of his autobiographical writings, Ensam (Alone), a book of tragic pathos; and in 1907-08 what is perhaps the most significant work of his last period, En bldbok (A Blue Book), of which further volumes were published after his death. Strindberg died in Stockholm on May 14, 1912. He is Sweden's greatest modern writer, and has exerted a deep and lasting influence on the European novel and drama,

the European novel and drama.

STRINGED MUSICAL INSTRUMENTS may be diyided into five different classes, according to the method whereby the strings are set in vibration.

Strings Plucked by Fingers or Plectrum.-Twanging the strings by the fingers is the most primitive method, probably suggested by the feeble note given out by the tense string of the hunter's bow. The nanga of the ancient Egyptians, of which

specimens are preserved in the British Museum, is the only link as yet discovered between the bow and the harp

The next step observed is the device of stretching the strings partly over a soundboard and partly à vide, as in the cithara. the lyre, the rotta, the crwth, etc. In this stage the strings were made to bridge an open space for greater convenience in twanging them with both hands The gradual closing up of this open space marked the steps in the transition from cithara to fiddle.

When the principle of stopping strings by pressing them against a fingerboard in order to obtain several sounds from each had been discovered and applied by adding a neck to the body, a new subdivision was created in this class of instruments. This principle involved a very great advance in technique, and produced the two great families of guitar and lute. The addition of a keyboard to the psaltery created another new class of instruments. of which the principal members were the clavicymbalum, the virginal, spinet and the harosichord

Strings Struck by Hammers or Tangents.—The earliest known instrument thus played was the Assyrian dulcimer or pisantir. In this, as in the psaltery, the strings were stretched over a rectangular or trapezoid sound-chest and were struck by sticks or hammers. The dulcimer has survived in the cembalo or cimbalom of the Hungarian gypsies. The addition of a keyboard produced the clavichord, and later the pianoforte.

Strings Set in Vibration by Friction of a Bow .-- Although used with various other instruments, such as the oriental rebab and its European successor the rebec, with the oval vielle, the gustar or troubadour fiddle and the viols, it is with the effect of the bow on the perfected type represented by the violin family that we are mostly concerned. The strings in this case are all of the same length, difference in pitch being secured by thickness and tension The fingers, by pressing the strings, produce a variety of notes from each string at will by shortening the vibrating section as the position of the fingers shift in the direction of the bridge. To this class belong also the Welsh crwth and the tromba marina.

Strings Set in Vibration by Friction of a Wheel.-This class is small, being represented mainly by the organistrum, and the hurdy-gurdy and a few sostenente keyboard instruments. In these instruments the rosined wheel performs mechanically the function of the bow, setting the strings in vibration as it revolves A row of 10 or 12 keys controlling wooden tangents performs the function of the fingers in stopping the strings.

Strings Set in Vibration by the Wind .-- An example is the aeolian harp. The eight strings of different thickness, but tuned strictly in unison and left slack, are set in vibration by a current of air passing obliquely across them causing the strings to divide into aliquot parts, thus producing various harmonics

In regard to the structural features of stringed instruments the construction of the sound-chest divides those played by hand into two distinct classes, viz., those with the box-form type, consisting of back and belly (or sound board), joined by ribs of equal width, and those with a vaulted back to which is attached directly a flat sound board, without the intervention of ribs.

STRIPE (CHEVRON): see Insignia, Military. STROBL, KARL HANS (1877-1946), Sudeten-German writer, born at Jihlava (Iglau) in Moravia on Jan. 18, 1877, was educated at the gymnasium there and at the University of Prague. From 1898 to 1913 he was in the finance department of the Austrian government, during which time he was also theatrical critic for the Brno Tagesboten. From 1913 to 1915 he edited a Leipzig paper, travelled extensively in Europe and wrote voluminously. He served as a correspondent on nearly all the fronts during World War I. From 1018 until his death on March 10, 1046, he lived as a writer in Perchtolsdorf, near Vienna. His works (novels, tales, lyrics, plays, essays and sketches) run into 80 vol., the best-known being tales of terror and ghost-stories: Eleagabal Kuperus (1910), Lemuria (1917); Umsturz in Jenseits (1920); Gespenster im Sumpf (1920); and Die Eier des Basilisken (1926). Among his student-stories, Die Vaclavbude (1902) and Der Schipkapass (1908) were popular. The Bismarck-Trilogie (1915-19) was probably his most successful historical novel. Other works are

Dorf im Kankasus (1936), Die Runen und das Marterholz (1936), Totenhorn Sudwand (1939), and Gluckhafte Wanderung (1942) See Anton Altrichter, Karl Haus Strobl, em Lebens-und Schaffunbid (Leipzig, 1927), R. A. Thalhammer, Karl Haus Strobl (1938)

STROBL DE KISFALUD, SIGISMUND (1884— ), Hungarian sculptor, was born at Abbrayk, Hung the studied at the Royal academy in Budapest, at the Académic Julan in Paris, at Vienna and in Italy. His early work, including the "Bather" at Amsterdam and "Woman with Lizard" at Budapest, was in the strictly classic style and was all in marble Later he did much work in contemporary portraits, a distinguishing characteristic of these is that intales are in bronce, whereas women and children are in marble. He spent much time in England, where he did busts of the duke of Kent, Lord Rothermeet, the earl of Athlene, Googe Bernard Shaw, Six Austern Chamberlan, Lord Allenby, Lady modables.

Among his best-known busts of Hungarian statesmen is that of Count Albert Appony! He had several erbiblions at the Royal academy in London, and a one-man show at a London gallery in 1935 In 1924 he was appointed professor in the Royal Academy of Art. Budanest.

STROBOSCOPE. The word stroboscope is derived from the Greek and means "whirling mark" or "whilling view." It designates an instrument which imparts the appearance of rest or of slow motion to bodies in rapid motion.

When a body moving with high velocity is illuminated brillhantly for a sufficiently short interval of time it appears to the eye to be at rest. For very high speeds the light intensity may not be great enough to reveal the body because of the extremely short exposure period required to arrest its motion successfully. However, if the motion recurs periodically and the body is lighted successively at precisely the same phase of its motion, then the additive effects give a clear view of the body at a faxed position

This "freesing" of motion of a wibrating or spinning body may be accomplished by permitting the eye to see the body only at certain recurring instants, or by the use of successive flashes of high intensity ilumination. In either case the illusion depends upon the physiological effect known as persistence of vision. To make the image formed on the retina appear continuous, the requency of interruption of viewing, or of flashing of light, must be greater than about 35 cycles per second.

The basic principle of the modern stroboscope is attributed to Joseph Antonne Ferdinand Plateau (1836). It had been used earlier in a less precise manner by Michael Faraday. August Töpler (1866) was among the first to reduce the method to an exact science.

In the early researches, particularly those concerned with observing acoustical vibrations, two types of procedures were employed. The first made use of intermittent vision; the second employed interrupted light. In both cases a spinning or vibrating disk equipped with a narrow slit allowed a view of the object at periodic intervals of time; or it permitted light to illuminate the body at successive instants. Thus, the body was exposed to view, or was illuminated, at precisely those times when it passed a given point in its mother.

Research reports and technical literature from the mid-roth century described many types of strobeogoic devices. Plateavidisk with radial slits was used to determine the rotational speed of wheels and shafts. The prongs of the strobescopic tuning fork were coupped with slotted disphragmas to create periodic interruptions in a beam of light. Rotating and vubrating mirrors were used to produce periodic pulsing of light for strobeoscopic observation. Mirror strobescopes are in use for viewing high-speed operations in spinning machines and in many other mechanisms. Electronic controls were added to secure accurate frequency control and synchronization of the light fishes.

Most stroboscopes employ the method of successive light flashes, the rate of flashing is altered a spinning or vibrating body appears to assume various speeds lower than its true frequency. A familiar example is that of moving automobile wheels viewed on a motion-picture screen. If the shutter frequency of the movie

camera agrees with that at which spokes on the wheel are passing a given point, the wheel apparently stands still. If the shirler frequency is greater than that of the successive passage of spokes, the wheel appears to turn backward. Conversely, at a shirler frequency slightly lower, the wheel seems to rotate slowly in the forward direction.

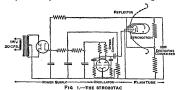

A common application of the stroboscopic method is determination of "slip" frequencies in electrically driven induction motors. The armature of a four-nole synchronous motor operated on a 60cycle line rotates exactly 1,800 times per minute. The speed of a four pole induction motor, on the other hand, is less by an amount which depends upon the type of motor and its loading. A circular cardboard disk divided into eight equal sectors alternately coloured white and black is attached to the end of the induction motor shaft. When the disk is illuminated by a pulsed light source operated from the same 60-cycle line, such as a spark occurring 120 times per second, the disk appears to rotate slowly in the backward direction. If, for example, the rotational frequency of the disk as determined by counting and the use of a stop watch is 20 r.p.m, the shaft speed of the induction motor is 1,800 minus 20, or 1,780 rpm. The speed of the shaft for a particular motor load can thus be directly compared with the frequency of the alternating current supply.

Disadvantages of old types of stroboscopes using mechanically produced light pulses are low light intensities and lack of accuracy and fleability in control of the rates of flashing. Sparks between short air gaps yield high intensity flashes of very short duration. They are, however, erratic in behaviour, are difficult of accurate frequency control, produce objectionable vapours and require constant attention. Modern stroboscopes employ electric gaseous discharge lamps filled with gases at reduced pressures, which produce very short flashes and are capable of high pulsing rates.

The neon-electric stroboscope employs a low voltage neon discharge tube, or "stroboglow" lamp. This lamp is caused to light up intermittently by the discharge of a condenser. Between flashes the condenser voltage builds up slowly, the instant at which the flash occurs being controlled by means of a grid in the neon tube. A thermione oscillator is used to furnish the pulses of grid voltage which effect the recurrent discharges of the gas. Although at provides feedible frequency control and is very reliable in operation, the neon stroboscope dees not furnish high illumination intensity.

Several types of gaseous discharge lamps produce light fishes of very high intensity suitable for photographic purposes. With precise synchronization of the flash and the recurrent motion of a body it is possible to obtain pictures with excellent definition. Minute details of rapidly moving machine parts such as gears, shutters, spinning looms, etc., may be photographed under normal operating condutions. Phasing of the light flash enables observations to be made of a mechanism at any desired instant of its mo-

The fundamental investigations of Harold E Edgerton and his associates at Massachusetts Institute of Technology, Cambndge, has resulted in the commercial development of a variety of stroboscopic flash lamps. Small bulbs are available for single flash

This strobescope is capable of producing low intensity light flashes. The flash lamp (Strobetron) is a neon thyratron yielding light bules 40 µsec in length. The speed control permits continuous variation in rate of flash ing over a range of frequencies from 600 to 14,140 pulses per minute

photographic work. A number of instruments using flash dis- to 200 mm. Hg. The two electrodes between which current flows charge lamps are also made, a simplified diagram of the essential parts of one of these units, the Strobotac, is shown in fig I

The neon lamp (Strobotron) is essentially a gas-filled thyratron having a suppressor grid A potential of about 125 v D C 1s applied to the discharge condenser and firing electrode of the lamp Except when pulsed the suppressor grid has a steady potential which prevents discharge of the condenser through the gas The oscillator supplies voltage impulses to the grid at a rate determined by the resistance and capacitance of the circuit At each impulse the lamp fires The mean duration time of the light pulse is about 40 µsec

Rate of flashing is governed by the speed control used to change resistance of the R-C circuit. Values of frequency are indicated on a calibrated dial Rates of from 600 to 14,140 pulses per minute are provided in two frequency ranges The unit is housed in a box which is approximately a 10-in cube, one side of which carries a 5-in, reflector for the flash lamp,

This device has a great variety of applications for precise frequency determinations and for observations of moving parts. A familiar demonstration in the physics laboratory or in the study of musical instruments is "freezing" of the motion of a vibrating string to show the number and position of nodes and loops. Hundreds of these instruments are in use in engineering and science laboratories and in industry

The Strobotac is employed as a basic speed control umt for operating other devices For technical operations requiring a much higher light intensity than that provided by the low power neon pulse tube two other units have been developed The Strobolux uses an argon-filled flash lamp, while the Strobolume employs a xenon discharge. These devices greatly expedited the use of stroboscopic methods in all types of analyses such as those required in factory production lines

A number of high-speed motion-picture cameras employing flash lamps were also developed. One type of instrument uses standard 35-mm film driven at high speed. The camera has no shutter, the framing being accomplished by a commutator on the film drive sprocket which flashes a power stroboscope at intervals of one frame Speeds up to 1,500 frames per second are obtained This instrument has been applied to the study of transient motions in automatic machinery, details of factory processes, cavitation of propellers under water, and to many kinds of studies requiring single and multiple flash photography.

Cameras manufactured for ultra-high-speed photography are particularly useful in studying the flight of bullets and jet-propelled missiles. Flash tubes are made having light pulse durations of the order of 1 µsec. A mercury flash tube of this type is used on a unit weighing about 20 lb, manufactured for scientific photography. It provides sufficient illumination for photographing objects up to 3 ft, when a lens aperature of f/4 and high-speed emulsions are used. For military applications special types of gas discharge lamps were developed in which the pulse is shorter than a tenth of a microsecond and with which very high rates of

repetitive flashing are attained.

The scientific development of electric flash discharge lamps was very rapid in the 1940s and thereafter. Great versatility was achieved to meet the demands of a variety of technical requirements. These lamps range in radiation brightness from low voltage neon glow tubes up through numerous types of photographic flash bulbs to large single pulse lamps requiring megawatts of instantaneous power and exceeding the brilliance of sunlight in visible illumination. Special units employed in military recognizance were not available for commercial applications at mid-20th century because of the Korean war,

Stroboscope flash lamps are produced in many sizes and shapes. Some are made of straight pyrex glass or quartz tubing ranging in length from a few inches to several feet. For compactness the tubing is normally formed into twisted spirals. These vary in size from tilbing in in. internal diameter, with the helix an inch or more long, to in, tubing in helices 4 in in diameter and 12 in. long. Rare gases or mixtures of gases and mercury vapour are commonly employed at pressures ranging from a few millimetres

are made of a special alloy to minimize vaporization and sputtering of the metals and thus prevent blackening of the tube walls

Lamps yielding high peak intensities required in photographic work are normally operated by connecting the electrodes to a condenser charged to a notential less than the breakdown voltage of the gas An external electrode consisting of a wire wiapped about the tubing is used to trigger the discharge. Triggering is accompanied by applying to the wire a pulse of potential rising to many thousands of volts in a fraction of a microsecond. In the rapidly changing field ions and electrons are formed in the gas and sufficient conduction is produced to cause the condenser to discharge through the tube Peak current values range from a few hundred amperes to several thousand depending upon the size of the lamp. kind of gas and its pressure, and electrical constants of the circuit

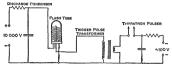

FIG 2 -- DISCHARGE CIRCUIT FOR HIGH-INTENSITY FLASH LAMP Opention of Discharge Line (Line ) FOR HIGH-INTERSITY FLASH LAMP Opention of Discharge Line (Line ) and the Company of the Co duce renetitive flashing

A typical discharge circuit for operating high-intensity flash lamps is shown in fig 2. In this arrangement, which is typical of a laboratory arrangement for studying the discharge, the charge from an auxiliary condense; is sent through the primary of a special type of transformer to produce a high voltage pulse for the external trigger electrode. Single flashes are caused by closing a switch; multiple flashing may be produced by means of a thyratron pulser.

The effective resistance of the arc formed in the gas when discharge occurs is defined as the ratio of arc potential to current flowing at the instant of its peak value. Potential and current measurements are made by means of oscilloscopes using carefully synchronized sweep. The arc resistance varies nearly inversely with the current in a particular lamp. Low intensity discharges have resistances of a few ohms. At several thousand amperes the

resistance values are much lower.

FIG 3 -- OSCILLOSCOPE TRACES OF

FLASH DISCHARGE IN ARGON

These blots are taken from photographs of synchroscope traces. The soops evere jie released by trigger pulse which initiates the discharge. Several successive pulses were used to get traces of current, potential and light responses. These are then photographs of the several successive pulses were used to get traces of current, potential and light responses. The service of the several several services are the services of the se ensitive to short wave infra-red radi-ation at about .85 µ, and filters were used to get the light curves. The ordinates do not represent correct relative intensities in the three spectral regions

Typical values obtained in a laboratory study of a medium intensity flash discharge tube are given by way of illustration A quartz tube with gas column 17 mm. long and 4 mm. in diameter was filled with pure argon at a pressure of 75 mm Hg This was pulsed 15 times per second using a 2 µf. capacitor charged from 1,200 to 3,000 v. Maximum current values ranged from 250 to 1,000 amp Effective arc resistances varied from 4 ohms at the low current value to 1.85 ohms at 1,000 amp. (See fig. 3)

The duration of the light flash is always longer than that of the current pulse For the argon flash tube just described onerated at 3,000 v. capacitor potential, the time taken for the current to rise to its half-maximum value was about 0.8 usec. The current decayed to its half value m 5 µsec and the total current pulse lasted 12 µsec Corresponding values of the visible light pulse produced was 3 µsec. for half-intensity rise, 14 µsec for the light to decrease to one-half its peak value, and the slowly decaying afterglow lasted for 40 µsec

Spectial observation of the induston as a function of time during the flash period is carried out by means of multiplier phototuber and a synchroscope. Results show that most of the intense
hight is a true continuum exhibiting closely the characteristics of
a black body radiator. Maximum intensity occurs at a wave length
of about 5,000 A. Superimposed on this continuum are spark lines
emitted by ions of the gas. These lines are very strong early in
the flash at the time of the current peak. As the light decays the
spark lines disappear and only atomic spectral lines are observed
in the later stages of the flash. The process of excitation and
ionization is of a thermal nature and electron temperatures of
12,000 K and highe are found. The highly energized gas
plasmas of these discharges resemble the states of matter observed in the attrospheres of the sum and other star.

It has been established that the mean intensity of the visible hight flash entitled by a given tube increases approximately as the square of the energy supplied by the condenser. This holds for slow flashing rates in which the tube is ventilated and the envelope is not excessively heated. For infin-red light the relationship is nearly a linear dependence. The mechanism of production of the most intense part of the continuous spectrum is believed to be due to retardation and another infinitely and the state of the continuous spectrum is believed to be due to retardation and atom (Brohmstrikhing) entitled by electrons for exception of excitation is often referred to as arising from "free-free" collisions of electrons and ions.

The rapid conversion of energy from electrical form to radiation in the high current are produces uddeen changes in gas temperature. Shock waves are generated by the flashes and luminous friends are observed passing through the gas of a side tube connected to the discharge. This method of generating shock impulses has been employed in the detailed study of shock waves at low gas pressures. In the operation of high intensity lamps sharp audible clicks are heard accompanying the breakdown discharges.

The glass wall of the flash tube is subjected to rapidly changing temperature gradients due to violent gaseous bombardment. Continued operation at high temperatures result in crazing of the inner surface of the well. This consists of a maze of very fine cracks which decreases the life of the tube Release of foreign gas from the glass rises the voltage at which the discharge occurs and leads to estatic triggering. This effect determines the maximum value of power which can be supplied to a particular type of flash tube to ensure constancy of output and nessonable life. Flash tubes of high power ratings are made of quants and are cooled with a forced light power ratings are made of quants and are cooled with a forced

The efficiency of conversion of electrical energy to radiation is remarkably high in stroboscope lamps operated in properly designed circuits. With low circuit resistance and neglipible inductance 90% of the energy stored in the condenser can be converted into energy of ionization and excitation of the gas. Both short wave length and long wave length addiations are trapped within the glass envelope. The amount of ultra-violet and of infrared radiation transmitted depends upon the material used in the tube walls

A large portion of the light is in the blue and near ultra-violet spectral regions and while this is very effective for photographic purposes it can cause severe injury to the retina of the eye. Workers subjected to prologost preptitive flashing of these sources developed eye strain and migraine headcates even when protected by goggles. Special protective devices must be provided to minimize the harmful effects produced by intense radiations from high power flash bulbs.

STRODE, RALPH (h. 150-1400). English schoolman, was probably a native of the West Midands. He was a fellow of Merton college, Oxford, before 1366, and famous as a teacher of logic and philosophy and a writer on educational subjects. He belonged, like Thomas Aquinas and Bonaventura, to that "School of the Middle" which mediated between realists and nominalists Besides his Logica, which has not survived, he wote Consequenties, a treatse on the syllogism, and Objectiones or Scholastica militia, a series of "Formal exercises in scholastic diaectics."

He had some not unfriendly controversy with his colleague John Wychffe, against whom he defended the possession of wealth by the clergy, and whose doctrine of predestination he attacked. Strode is also associated with John Gower in Chaucer's dedication of Troyluss and Cryseyde, and Strode himself, according to the 15th-century Vetus catalogus of fellow of Merton, was a "poeta nobilis"

John Leland and John Bale confirmed this testimony, and L Gollancz suggested the identification of the Phaniasma Radulphi attributed to Strode in the Venus catalogus with the beautiful 14th-century elegiac poem The Pearl. If this be true, Strode wrote also Cleamess, Patence, and Sir Gawayne and the Green Kmight. From 1375 to 1385 this Strode or another of the same name was common sergeant of the city of London; he died in 1387.

STRODE, WILLIAM (1598-1645), English parliamentarian, second son of Sik William Stoode, of Newham, Devenshire (a member of an ancient family long established in that county, which became extinct in 1897). He was admitted as a student of the Inner Temple in 1614, matriculated at Exeter college, Oxford, in 1617, and took the degree of bachelor of arts in 1619. He was returned to parliament in 1624 for Beeralston and represented the borough in all succeeding parliaments until his death. He from the first threw himself into opposition to Charles I and took a leading part in the scene of March 2, 1629, when the Speaker, Sir John Finch, was held down in the chair. (See HOLLES, DENZH HOLLES.)

Proscuted before the Star Chamber, he refused "to answer anything done in the House of Parliament but in that House." On May 7, a fresh warrant was issued, and a month later, to prevent his release on bail, he was sent by Charles with two of his fellow members to the Tower. Refusing to give a bond for his good behaviour, he was sentenced to imprisonment during the king pleasure, and was kept in confinement in various prisons for II years.

In Jan. 1640, in accordance with the king's new policy of moderation, be was bherated; and on April 13, took his seat in the Short Parhament, with a mind embittered by the sense of his wrongs. In the Long Parliament, which met on Nov. 3, 1640, he was the first to propose the control by parliament over ministerial appointments, the militia and its own duration; supported the Grand Remonstrance of Nov. 7, 1641; and displayed a violent

zeal in pursuing the prosecution of Strafford actually proposing that all who appeared as the prisoner's counse! should be "charged as conspitators in the same treason" He was included among the five members impeached by Chailes of high treason on Jan 3, 1642 He opposed all suggestions of compromise with Charles, urged on the preparations for war, and on Oct 23, was present at the battle of Edgehill In the prosecution of Laud he showed the same relentless zeal as he had in that of Strafford, and it was he who, on Nov 28, 1644, carried up the message from the commons to the lords, desiring them to hasten on the ordinance for the archbishop's execution Strode did not long survive his victim He is mentioned as having been elected a member of the assem-

order of parliament was accorded a public funeral in Westminster abbey The body was exhumed after the Restoration Clarendon speaks of Strode as a man "of low account and esteem" who gained his reputation by his accidental association with those greater than himself, but to his own party his "insuperable constancie" gave him a title to rank with those who had deserved best of their country at a time when the liberties of England hung in the balance

bly of divines on Jan 31, 1645 He died Sept 9, 1645, and by

STROMNESS, a small burgh and fishing port on the island of Mainland (Pomona), county of Orkney, Scotland Pop (1951) 1,503 Area 712 ac It is situated on the west side of a wellsheltered bay opening off Hoy sound. Many of the houses are within tidal limits and are furnished with quays and jetties. The harbour admits vessels of all sizes There is an egg-packing station, and eggs are exported to the Scottish mainland. The neighbourhood suffered much damage from the great storm of Jan 1953

Stromness is a centre for visiting the magnificent scenery of the west coast of Mainland, including Black craig (400 ft ) and the Hole of Row, a natural arch carved out by the ocean At the southern edge of the bay of Skaill lies the prehistoric village of Skara Brae (q v)

STRONG, LEONARD ALFRED GEORGE (1896-

), British author and journalist, was born March 8, 1896, at Plympton, Devon, and received his education at Brighton college and at Wadham college, Oxford, where he was awarded his bachelor's degree in 1920 His first work was in verse (Dublin Days, The Lowery Road, Difficult Love) and showed the influence of William Butler Yeats His first novel was Dewer Rides (1929), a story laid in Dartmoor; later books included The Jealous Ghost (1930), The Garden (1931), The Open Sky (1939), Travellers (1945) and Trevannion (1948) Strong published several collections of short stories and also stories for children His critical works include Sacred River, An Approach to James Joyce (1951) For 12 years he taught English and classics at Summer Fields,

Oxford In 1938 he became a director of a publishing house STRONG ROOMS: see SAFES, STRONG ROOMS AND VAULTS STRONGYLION, a Greek sculptor His bronze figure of a horse, representing the wooden horse of Troy with the Greek heroes inside and looking forth, was set up on the Acropolis of Athens late in the 5th century B.C. Other works of Strongylion were a figure of Artemis at Megara, a group of the Muses, and an Amazon which was greatly admired by the emperor Nero.

STRONTIANITE, a mineral consisting of strontium carbonate SrCO3. It takes its name from Strontian in Argyllshire, where it appears to have been known as far back as 1764, but it was not recognized as a distinct mineral until later, when the examination of it led to the discovery of the element strontium. It crystallizes in the orthorhombic system and is isomorphous with aragonite and witherite. Distinctly developed crystals are, however, of rare occurrence; they are usually acicular with acute pyramid planes and are repeatedly twinned on the prism. Radiating, fibrous or granular aggregates are more common. The colour is white, pale green or yellowish brown. The hardness is 3.5 and the specific gravity 3.7. The mineral occurs in metalliferous veins in the lead mines of Strontian in Argyllshire, abundantly in veins in calcareous marl near Münster and Hamm in Westphalia, in limestone near Barstow, San Bernardino county, California, and in geodes at Schoharie, N.Y.

It is used for producing red fire in pyrotechny and for refining

(CLF.X)

STRONTIUM, a metallic element (symbol Sr. atomic weight 87 63, atomic number 38), belonging to the alkaline earth family of elements in group two of the periodic table. It composes about 00010% of the igneous rocks and about 02% of the entire crust of the earth It is distributed in small quantities in many different rocks and soils Its principal sources are strontianite, SrCO3, and celestite, SrSO;

William Cruikshank, in 1787, first detected the existence of the element in the strontianite found at Strontian in Argyllshire The metal was isolated in 1808 by Sir Humphry Davy, who electrolyzed a mixture of the moist hydroxide or chloride with mercuric oxide, using a mercury cathode. It was obtained in a state of purity by A Guntz and Roedeser by heating the hydride in a vacuum to 1.000° C It may be obtained in the form of sticks by the "contact cathode" method, in which a cooled iron rod, acting as a cathode, just touches the surface of a fused mixture of potassium and strontium chlorides and is raised as the strontium collects on it Because calcium and barium, which it resembles closely, occur in much greater abundance, strontrum is not produced in commercially important quantities and has no uses,

There are four isotopes of the element, their mass numbers, in the order of abundance, are 88, 86, 87 and 84 Artificial radioactive isotopes with mass numbers 85, 87 and 89 have been prepared The distribution of electrons in the levels and sublevels of the strontium atom 15 1 s2, 2 s2, 2 p6, 3 v2, 3 p6, 3 d10, 4 s2, 4 p6, 5 s2

Properties.-Strontium, as usually produced by electrolysis, is a soft, slightly yellow metal which greatly resembles calcium The pure metal has a silvery white colour. It is malleable and ductile and acts as a good conductor of electricity Other physical properties are listed below.

Atomic radius

2 14 A. 1 13 A. Ionic radius Ionization potential (gaseous element) 1st electron 561 v. and electron 10 08 W Single electrode potential (between metal and molal solution of Si \*\*ion) 2 80 V 757±1° C. Melting point Boiling point Density 26 g per cubic centimetre

The chemical properties of strontium are similar to those of calcium and barium, in keeping with its position in the periodic table, where it is above barium and below calcium. Generally speaking, its base-forming characteristics are somewhat less pronounced than those of barrum but more pronounced than those of calcium. In its compounds, the element has a valence number of +2. As indicated by its atomic radius, ionization potential and single electrode potential, the atom of strontium easily loses the two electrons in the 5 s level when it reacts with nonmetallic elements, thus forming the Si\*ton The element is an active re-It reacts readily with water to form hydrogen and the hydroxide, Sr(OH). It ouddzes rapidly when exposed to the air and buins brilliantly when heated in air, oxygen, tholonie, the vapour of bionaine or the vapour of sulphur With oxygen, the element forms biomine or the vapour of sulphur With the monoxide, SrO, and the peroxide, SiO

Compounds.—Compounds of strontium are not so extensively used as those of calcium or barum The solubilities of the salts of the ment, generally speaking, are intermediate with respect to the

solubilities of the corresponding salts of calcium and basium.

The hydride, SrH<sub>2</sub>, obtained by Guntz on heating strontium amalgam in a current of hydrogen, is a white solid, which readily decomposes water in the cold and behaves as a strong reducing agent The monoxide or strontia, SrO, is formed by strongly heating the mirate, or commercially from the hydroxide which is produced by heating the sulphide or carbonate in superheated steam (at about 500-60° C) It is a white powder which resembles lime in its general character By heating the powder in the electric furnace, H. Monssan succeeded in obtaining crystals of the oxide. The compound readily slakes with water, and the aqueous solution yields a crystalline hydrated hydroxide It is used in the extraction of sugar from molasses, since it combines with the sugar to form a soluble saccharate, which is removed and then decomposed by carbon dioxide. A hydrated peroxide, approximating in composition to SrO<sub>2</sub>.8H<sub>2</sub>O<sub>3</sub> is formed as a crystalline precipitate when alkah is added to an aqueous solution of a strontum salt containing hydrogen peroxide. If all the solutions are above 50° C, and concentrated, the anhydrous peroxide results, Strontum fluoride, StF.3 is obtained by the action of hydrofluoric acid on the carbonate, or by the addition of potassium fluoride to strontum chloride solution Strontum chloride, StCl, 6H.0, is obtained by dissolving the carbonate in hydrochloric acid or, commercially, by fusing the carbonate with calcium chloride and extracting the melt with water. It crystallizes in small colourless needles and is easily with water II Cybaillacks in Stalla colouries needles and is easily solible in water, the concentrated aqueous solution dissolves bromme and nodme readily By concentrating the aqueous solution between go -130°C to by passing hydrogen chloride into a saturated aqueous solution, a scond hydrated form of composition, SiCl; 2H,O, corresponding with dihydrated barrium and iadmin chlorides, is obtained The anhydrous chloride is formed by heating the hydrated chloride in

a current of hydrogen chloride

Strontism valbhide, StS. is formed when the carbonate is heated to Strontum sulphule, SiS, is formed when the cathonate is heated to tedness in a stream of hydrogen sulphule. It phosphoresces slightly when pure Strontum sulphule, SrSO., found in the mineral kingdom as celestite, is formed when sulphurie and or a soluble sulphule is added to a solution of a strontum salt. It is a colourless solid, which temperature, it is appreciably soluble in concentrated sulphuric acid
When boiled with alkaline carbonates, it is converted into strontum

carbonate

carbonate nutrade, Sr.Nn, is formed when strontium amalgam is heated to redness in a stream of introgen or by igniting the oxide with magnesium. It is readily decomposed by water, with hieration of ammonia Strontium nutrate, Sr(NOIn), is obtained by dissolving the acrbonate in disulte intin each if reystallizes from water (in which it is soluble) in monoclinic prisms which approximate in composition to  $Sr(NO_d)_3 4H_2O$  It is used in pyrotechny for the manutacture of red

Strontium carbide, SrCe, is obtained by heating strontium carbonate with carbon in the electric furnace II resembles calcium carbide, decomposing rapidly with water, giving acetylene Strontium carbonate, SrCO<sub>3</sub>, found in the mineral kingdom as strontianite, is formed when a

STCOs, found in the mineral kingdom as strontaints, is formed when a solution of a carbon dioxide when nested above constraints and the strong carbon dioxide when nested above constraints are solved to the strong carbon dioxide when nested above constraints are solved to the strong carbon dioxide when the strong carbon dioxide s

In the usual schemes of analysis, strontium is separated, along with In the usual scenes of analysis, stomatin is separated, adong war-calcium, barium, magnesum and the alkah metals, by making use of the fact that none of these ions is precipitated by sulphide ion in either an acidic or an alkaline solution. After the precipitation of all other positive ions by the sulphide ion, calcium, strontium and barium are precipitated as carbonates in the presence of ammonium ion precipitated as Carbonates in the presence of amountain or precipitate is then dissolved in acetic acid, and, in the usual procedure, barium is then separated by precipitation as the chromate, leaving

barum is then separated by precipitation as the chromasi, leaving structure and calcium ions in solution Strontium non can then be separated from calcium by the addition of a dilute solution of sulphate ion which, because of the considerably greater solution of sulphate ion which, because of the considerably greater solution of sulphate ion which possible of the sulphate in the sulphate in the sulphate is supported by the sulphate in the sulphate in the sulphate is supported by the supported by the sulphate is supported by the supported by the sulphate is supported by the sulphate is supported by the sulphate is supported by the supported by the supported by the supported by the sulphate is supported by the supported b

STROPHANTHUS, a genus of plants of the family Apocynaceae, deriving its name from the long twisted threadlike segments of the corolla, which in one species attain a length of 12 to 14 m. The genus comprises about 28 species, mainly tropical African, extending into South Africa, with a few species in Asia, from eastern India to the Philippines and China. Several of the African species furnish the natives with the principal ingredient in their arrow poisons—S. hispidus and S. kombe being probably most frequently employed.

Both S hispidus and S. kombe have hairy seeds with a slender threadlike appendage, terminating in a feathery tuft of long silken hairs, the seeds of the former being coated with short appressed brown hairs and those of the latter with white hairs; but in the species used at Delagoa bay and called umtsuli the threadlike appendage of the seed is absent. The natives pound the seeds into an oily mass, which assumes a red colour, portions of this mass being smeared on the arrow immediately behind the barb.

Under the name of strophanti semma, the dried ripe seeds of Strophanthus, freed from awns, are official in the British and many other pharmacopeias. The seeds must be mature. They are about in long, in broad, greenish fawn, covered with flattened silky hairs and oval-acuminate in shape. They are almost odourless but have an intensely bitter taste. The chief constituent is a white microcrystalline glucoside, known as strophanthin, freely soluble

in water and alcohol, but not in chloroform or ether, and melting at about 173° C It constitutes about 50% of the mature cotyledons of the mature seed. The resin is contained in the husk and occurs in the alcoholic tincture of strophanthus

Pharmacology -The drug has no external actions Taken interritarinacology—The drug has no even a actions from the instance and in the repetition of large doses, to produce some gastric unitation. As ordinarily administered, the drug acts on the heart before influencing any other organ or tissue. It is almost certain that strophanthus acts directly on no other cardiac structure than the muscle fibre. No action can certainly be demonstrated either upon the vagus nerves or upon the intracarduc nervous ganglia. The muscular force is increased in a very marked degree. A secondary consequence of this is that the diastole is prolonged, and the pulse thus rendered less frequent. If the heart is beating irregularly the drug tends to make it. more regular. In fatal cases of strophanthus possoning death is brought about by the airest of the heart in systole, ie in a state of tetanic spasm from overstimulation. Strophanthus markedly ruses the blood pressure, but this action is almost entirely the result of the increased force of

STROPHE, a term in versification which properly means a tuin, as from one foot to another, or from one side of a chorus to the other (Gr στροφή, "a turn") Hence, the song of a chorus during one turn or figure of a dance, and thus a collection of various prosodical periods combined into a structural unit When the strophe is answered by another unit of identical scansion (called an antistrophe) and accompanied by a third of some-

what different structure (epode), the three form a period STROSSMAYER, JOSEPH GEORGE (JOSEP JURAJ STROSSMAJER) (1815-1905), Croatian bishop and politician, was born at Esseg in Croatia-Slavonia on Feb 4, 1815. He became lecturer on theology at Djakovo, chaplain to the Austrian emperor and director of the Augustinian body at Rome. In 1840 he was consecrated bishop of Djakovo, with the official title bishop of Bosnia, Slavonia and Sirmium. He fostered the growth of Slavonic nationalism in Croatia-Slavonia, in Dalmatia and among the Slovenes of south Austria, aiding the Ban Jellacic in his campaigns against Hungary (1848-49) and subsequently becoming a recognized leader of the opposition to Hungarian predominance. (See Croatia-Slavonia) Besides being foremost among the founders of the South Slavonic academy in 1867, and of Agram university in 1874, he helped to reorganize the whole educational system of Dalmatia and Croatia-Slavonia He built a palace and cathedral at Djakovo, founded a seminary for the Bosman Croats, presented the South Slavonic academy with a gallery of valuable pictures and published collections of national songs and tales. He also aided Augustin Theiner, then librarian at the Vatican, to compile his Vetera monumenta Slavorum meridionalium historiam illustrantia (Rome, 1863) Strossmayer died on April 10, 1905. He was a count of the Holy Roman empire and a bishop of the pontifical throne.

STROUD, a town in the Stroud and Thornbury parliamentary division of Gloucestershire, England, 9 mm. S. of Gloucester by road. Pop. of urban district (1951) 15,977. Area 4 4 sq.mi The town hes in the Stroudwater valley, at the junction of several deep narrow valleys, near the Cotswolds It is on the disused Thames-Severn canal and has long been a centre for cloth manufacture, particularly broadcloth, and dyeing, but many former woollen mills are now used for the manufacture of other goods, and engineering has become important. The Elizabethan town hall has been restored

STROUDSBURG, a borough of eastern Pennsylvania, U.S., the county seat of Monroe county; on Broadhead creek, opposite East Stroudsburg (q.v.). It is on federal highways 200 and 611 and is served by the Lackawanna and the Pennsylvania railways. Pop. (1950) 6,361; (1940) 6,186; (1930) 5,961; federal census Stroudsburg is a summer resort 3 mi. W. of the Delaware water gap and 15 mi. from the heart of the Pocono mountains. It has various manufacturing industries. A number of colonial houses still stand, notably the Jacob Stroud mansion (1760) which served as a refuge at the time of the Wyoming massacre. The borough was laid out in 1806.

STROZZI, the name of an ancient and noble Florentine family, which was already famous in the 14th century. Palla Strozzi (1372-1462) founded the first public library in Florence in the monastery of Santa Trinita. Filippo Strozzi il Vecchio

(1436-1491), son of Mattee and of Alessandra Macnigh, began to build the beutiful Strozei place in Florence Another Flippo Stroze. (1488-1538), who, although marued to a Medict, opposed the hegemony of that house and was one of the leaders of the rising of 1527. On the final overthrow of the republic in 1530 Alessandro de' Medica attempted to win over Flippo Stroze, but Strozei had no faith in the tyrant and retired to Vennec After the murder of Alessandro he undertook the leadership of a band of republican eciles with the object of re-entering the city (1537), but third packed feated and captured and put to the torture, he committed succide. His son Leone (1515-1524) was a distinguished admiral in the service of Pracea and fought against a distinguished admiral in the service of Pracea and fought against The Strozei palace, which belonged to the family until 1907, was becouched for will to the Italian nation.

STRUCTURAL DRAWING: see Drawing, Engineering

STRUCTURAL ENGINEERING. The term structural engineering came nto accepted use in the United States duming the 19th century, in relation to the particular branch of evil engineering which was concerned with bridge building A ta later date the term came to be used more frequently in connection with the great development of steel-framed and reinforced concrete buildings in that country, and it is mainly in this connection that the term has been accepted and used throughout the world

From the brief survey in this article of the development of structural practice, it will be seen that the most fundamental change has not been in the use of mild steel, or, in fact, in the use of any relatively new material, but in the intelligent application in the design of structures of a rapidly extending knowledge good of mechanics and of the scientific use of construction materials. Hence there is a general tendency to give a wider significance to the term structural engineering and to set no arbitrary limits either to the materials employed or to the nature of the structures in which they are embodied.

Structural engineering embraces the design and construction of all those vital structural parts of buildings, and other substantial erections, in which a knowledge of the strength and nature of the materials used and of the relevant principles of the science of mechanics are the controlling factors. See also the articles on Accurractural and Burness.

Early Development of Structural Practice .-- While the more modern developments of structural engineering have been largely coincident with and dependent upon parallel developments in the production and use of iron, steel and Portland cement, the development of the science of mechanics and of the theory of elasticity have occupied a much longer period of time. Until the middle of the 18th century constructional practice of all kinds had been chiefly governed by the common traditions accepted in the various crafts. This practice was subject to the losses, faults and checks to which knowledge so acquired and held is peculiarly hable. The high state of development of the science of stereotomy or jointing of stone work should, however, be noted, particularly as applying to stone arches, vaults and domes. It arose out of the construction needs of the great cathedrals of the middle ages, The great era of bridge building, which may be said to have been initiated by the erection of the second bridge over the Thames at London by the French engineer Labelye in 1749, and by the successful completion of William Edwards' third bridge at Pontypridd in 1755, continued for the remainder of that century, and may be credited with the establishment of a new era in constructive ability and knowledge. At later dates notable bridges were erected by Robert Mylne, Thomas Telford and John Rennie, which carried this aspect of structural design to an advanced stage

Use of Cast Iron.—In England in 1755, the use of cast iron in construction had been advocated by John Smeaton, and by the end of the century much experience had been acquired in the production of a uniform and reliable material and in the possibilities of its use in buildings. "The most striking use of the metal probably occurred in the construction of arched bridges, where cast-iron voussoirs were employed in the place of stone: the first bridge of

this kind was completed at Coalbrookdale in 1776 (Much conidence was shown in this type of bridge construction and Renne prepared designs for a cast-iron bridge of 450 ft. span over the Menia straits) At a still later date the cast-iron units were made in longer sections and botted together, so that they were called upon to resist tensile forces and the sections of the ribs approximated to cast-iron beams of curved outline

Meanwhile, the use of cast-iron in the construction of factory buildings in the north of England was developed, first in columns to support timber beams, and later in the substitution of cast-iron beams for timber. At the commencement of the right century, a building was designed by Boulton and Watt and crected in Man-chester, in which cast-iron beams were supported on cast-iron columns, while the floors consisted of brick arches supported on be bottom flanges of the beams and brought to a level surface by rough concrete Buildings of this type were erected with little change for a long period. The principles underlying this form of construction were at first little understood, but such men as 5 in constitution which is the constitution of the constitution

Use of Wrought Iron and Steel.—The great improvements in the manufacture of wrought iron, which followed upon the introduction and development of the pudding furnace and the rolling mill by Henry Cort toward the end of the 18th century, let to its increased use in construction, while the investigations into the strength of acti-tron referred to above probably stimulated the more effective use of wrought iron, the nature of which approximated more closely to the ideal elastic material conceived by the mathematicians and physicists. Only the simplest sections were rolled in the solid, beams.

were rotted in the sount, beams.
In 1847 Ferdmand Zores produced a small rolled joist or I-section, the form being decided upon after consultation with French ton, the form being decided upon after consultation with French ton, the state of the sound to the sound at the Fars exhibition in 1854 and the sarry small rolled joint were largely used in France as the basis of fire-resisting floor construction, but while they were obviously of value in other forms of construction, the I-section came very slowly into general use The first steel-joint section to be produced in England was rolled by Dorman and Long in 1855. The Harper building in New York city built in 1854 was the first one to have wrought-iron beams set in masonry walls as lateral supports.

Cheap and reliable mild steel became available through the introduction of the Bessemer and Siemens-Martin processes of production but prejudice and early difficulties in manufacture delayed its use. As late as 1877 in England board of trade regulations prohibited the use of mild steel in bridge constitution. In the construction of the Forth bridge (1880-90) mild steel was, however, employed and the success of this venture constitutes a remarkable tribute to the skill of the structural engineers at that date and a testimony to the fitness and rehability of this material for bridge work and general constructional use. The extended use of steel for structural purposes was assisted and guided by the introduction of standard forms and dimensions, and by uniform specifications The American Society of Civil Engineers, founded in 1852, in co-operation with the steel manufacturers contributed immensely to the development of standard formulas. In 1894 the Carnegie-Phipps company of Pittsburgh, Pa, published a handbook of standard shapes with information and formulas as to their structural properties. These remained standard for years and were basic for many subsequent handbooks published American cities, where skyscraper construction started, building laws were passed giving effect to the conclusions of these early developments. In England specifications were issued by the British Engineering Standards association (formed in 1904), and the passing of the London County Council (General Powers) Act of 1909, provided the first authoritative regulations for the control of the design of steel-framed buildings

Development of Framed Construction.—In the construction of various kinds of framed structures iron was being used to

a considerable extent by the middle of the 19th century, thus the ings on city sites were rapidly recognized both by the land-owner technique of this form of construction was being steadily developed In some of the larger structures pin joints were used, but these were gradually discarded in England and the simpler riveted joint adopted. Of this latter type of construction Tuelier's lattice girder bridge (1868) consisting of 300 ft. spans over the Mersey at Runcorn is a good example

At a somewhat earlier period, similar developments in framed construction were taking place in America, where road bridges were being erected to meet a great demand. The majority of these were constructed in timber alone, or in timber and iron, but the well known forms of Howe truss (1830) and Pratt truss (1844) which were developed in this connection represented substantial progress in the design of framed structures. At a later date, the development of the wire rope by Robling, applied in the construction of the great suspension bridge at Brooklyn, indirectly influenced the introduction and perfection of the lift or elevator, which became, and is now, so vital an equipment of all tall build-

While a considerable amount of iron was used in the construction of buildings until well into the latter half of the 19th century, the construction of normal types was based on the assumption that the walls constituted the chief supports for transmitting structural loads to the foundation; also, since the thicknesses of these walls were regulated by building by-laws-which were based upon tradition and custom rather than upon scientific conclusion-the height to which buildings could be economically carried was limited, owing to the thick walls necessary to conform with the bylaws Moreover high building possessed no great advantage without lifts The first passenger elevator equipped with automatic safety devices was installed in 1856 by Elisha G Otis in a New York store In this the hoist tope was wound and unwound from a steam-driven drum to raise and lower the car

The Crystal Palace buildings, erected by Paxton for the 1851 Exhibition in Hyde Park, were not usually claimed as one of the early examples of iron-framed buildings, yet the structure was remarkable in having foreshadowed and established a principle adopted in the modern steel building, in which the walls do not transmit any important portion of the structural load to the foundation. It was, however, the developments which took place in America at a later date which were to influence most markedly the progress of this form of construction throughout the world In the year 1883, during a period of unusual building activity in Chicago and following an extensive fire in that city, W. L. B Jenney designed a building of 10 storeys that is the forerunner of all high buildings. Afterwards two storeys were added, making the building 12 storeys, proving the soundness of the original calculations This building, the Home Insurance building, is the first of all skyscrapers It was finished in x885. While it is true that L. S. Buffington, a young architect in Minneapolis, had thought of steel skeleton structures as early as 1880, it remained for Mr. Jenney to put the problem to practical test There is, however, some controversy regarding who should get credit for the first skeleton construction building

Skeleton Construction.-The Home Insurance building was designed with relatively thin outer walls, the dead load of which is placed on a framework of iron concealed inside the masonry and used to transmit the weight to the foundation. The framework was made of cast fron columns, and wrought fron I-beams, the beams being bolted to the columns with angle iron brackets. At the suggestion of the Carnegie-Phipps Steel company, rolled Bessemer steel beams, then being first produced, were used above the fifth floor. Cast-iron columns were used to the top since plates and angles of steel, of which the later steel columns were built up, had not yet been rolled. The term skeleton construction was later applied to all buildings of this type. Besides the development of the steel framework, the elevators, the use of Portland cement, another factor of great importance in the creating of skyscrapers was the invention of hollow tile in 1871 by Balthaser Kreisher, which solved both the dead-weight and the fire protection problem.

The advantages to be derived from the erection of high build-

and the building-owner; site values were enormously increased and much greater accommodation became available on a restricted area The adoption of skeleton construction also led to speedier erection, since, on the completion of the steel framing, the building of walls and the construction of the floors could proceed

simultaneously on several floor levels As confidence in the type of building increased, higher and yet higher structures were erected, and since most of them were relatively slender and were frequently built on sites that afforded poor foundations, the use of piles and of the caisson-already adopted by the bridge builder to ensure sound foundations-increased and developed Improved practice in the construction of foundations became fundamentally important in the further growth of this type of building, and many ingenious and effective developments occurred, including combined foundations for two or more columns, and also cantilevered foundations, by means of which the actual foundation construction for the external or boundary columns could be kept within the limits of the site. (See article on FOUNDATIONS )

Protection from Fire.-Early experience showed the very complete destruction by fire of iron and steel buildings in which the distortion of the framework, under the effects of excessive heat, resulted in the collapse of the metal framework and walls The importance of fire protection is now generally recognized and the vital parts of steel buildings are required to be protected by terra-cotta, hollow tile, cement concrete or other fire-resisting materials In America a definite limit of height is generally set by the building regulations for the control of non-fireproof buildings, but if adequate and ample fire-protection of the structural fabric is provided in the permanent construction, no arbitrary limit is set to the height in some American cities; in others there are height limitations It is necessary, however, to provide, for all high buildings efficient warning, fire-checking and fire-fighting equipment, such as stand-pipes and extinguishers, especially at heights beyond the scope of the local fire-fighting equipment. The work of the various Fire Assurance companies and, more recently, the effective research and investigations of the National Board of Fire Underwriters, has influenced fire-protection, assisted in the improvements of constructional methods, and helped to render these improvements rapidly effective. In Great Britain, structural practice and consequent building developments have been somewhat different from those of America Very high buildings have not been favoured for a variety of seasons which are referred to elsewhere in this article One of the arguments that was used in the past against high buildings was the difficulty of dealing with fires at great heights Experience in America, however, has proved that adequate provisions can be made to meet such emergencies.

Wind Pressure,-There are obvious dangers associated with tall structures, which arise chiefly from the effects of wind pressure upon the exposed elevated faces Stability of the structures as a whole is now generally obtained by a combination in the building of rigidity and weight. While the steel frame in itself is sufficiently rigid to reduce distortion under wind pressure to a negligible amount, in all calculations the rigidity of the walls is taken into consideration, as it is a considerable factor in resisting distortion. The necessity for maintaining a rigid form of frame which would resist distortion under side pressure has led to the development of the braced structure and of the structure with rigid connections. Both these types demand of the designer a knowledge of the most advanced sections of mechanics and structural engineering. Much experimental research upon problems associated with tall structures has been carried out in the universities of America and by American engineers, from which satisfactory bases of design have been developed or theories verified. The progress of framed construction in tall buildings has enabled such a high degree of achievement to be reached. that careful experiments upon one of the tallest buildings recently erected in America have fully demonstrated that, even in the strongest gales, the little vibration that occurs is of no consequence in such structures.

Electric welding, to replace riveting, is still in the experimental

is provided by the riveted structure, two objects are being sought. the elimination of noise and the saving in steel that would result from not needing such heavy angles at the connections

Corrosion .- During the later development of skeleton construction considerable attention was given to the dangers which might ause from the corrosion of important parts of these steel structures In the earlier days of steel construction applied to buildings, insufficient care was given to the protection of hidden and maccessible parts, and connections and members were often so designed and fabricated that protection was difficult to apply A few failures have occurred owing to corrosion, but the recent demolition of some of the earliest tall buildings in America has demonstrated that, with reasonable care, the life of the ordinary type of steel-framed building may be practically indefinite if the work is properly done. At the same time the investigation has led to the recognition of the value of concrete as a suitable and effective encasing material for the protection of steel Reliable and durable protective paints have been produced and are now in wide use for the treatment of steel framework to be enclosed in masonry They should be freely applied in at least two coats to all parts where actual encasing in solid concrete is not specified Some hopes are entertained that a solution of the problem of corrosion will be found in the production of non-corrosive steel. having the necessary structural properties and yet economical in

Building Regulations,-The extent to which the adoption of suitable building regulations has assisted in the development of efficient and economical methods of construction has varied in different countries. In Great Britain, the type of local by-law which has generally been in force has lagged seriously behind the best accepted modern practice and has often acted as a deterrent to such development. In relation to the construction of walls the regulations have had a restrictive effect since they have compelled the erection of exceptionally thick walls. In relation to other parts of buildings such as roofs, floors and columns these by-laws are usually madequate and arbitrary and, while they may be of a character to prevent the erection of unsafe structures, they have not tended to encourage the adoption of better forms of construction

The first and the most outstanding regulations to govern steel building construction in Great Britain were embodied in the London County Council (General Powers) Act of 1909, and are usually referred to as the L.C.C. Regulations for Steel-Framed Buildings. These regulations, while containing some peculiar features and restrictions, had a marked effect upon the development of this form of construction and there has since been a steady increase in the number of buildings erected in accordance with them At present, practically all large buildings erected in London, apart from reinforced concrete structures, are designed and erected as steel-framed buildings.

In consequence of the manner in which the L.C C. regulations were framed, they applied only to new buildings in which the main structure was to be of steel, while buildings in which steel was combined structurally with other materials were still subject to the older regulations. This lack of co-ordination has tended to discourage forms of composite construction which, for smaller buildings would often have produced more economical results. Under the London County Council (General Powers) Act 1926 eftorts are being made to remove these and other anomalies.

In the United States a much closer relation has been established between regulation's and practice, and many thorough revisions of local building codes, particularly in their effect on steel construction, have been undertaken during the last twenty years in American cities. The general methods of procedure and supervision adopted by authorities in the United States are more elastic in practice than in Great Britain, so that the regulations do not tend so much to discourage the best available methods offered by the engineers and contractors; the system in vogue is indeed equivalent to a continual revision of the regulations, thus encouraging constant progress and improvement,

In this connection the investigations carried out by the Bureau

state While no additional strength or rigidity is necessary than of Standards in Washington, D.C., and by various professional bodies have proved most valuable, the results of such investigations-conducted under practical and exhaustive conditions-being incorporated in the various building codes when approved and accepted by the responsible and representative professional institutions

Reinforced Concrete,-The adoption and development of construction in reinforced concrete has followed the lines common to steel work, since the theoretical basis is almost identical, and the production of suitable specifications and regulations has been the product of similar efforts. Reinforced concrete buildings are usually of the framed type of construction, consisting of pillars and beams, as in steel work, but with the wall and floor panels continuous between columns and beams, so that the concrete enclosing the reinforcing steel is continuous and the structure is monolithic in character. All the intersections of beams and columns are thus rigid connections and the rigidity of such structures is one of their main features. In recent years the study of elasticity has been closely followed in its application to reinforced work, where the straining of one member is definitely communicated through the rigid continuation to the adjoining members Hence the designer of reinforced concrete must have an unusually thorough structural training if he is to comprehend and provide successfully for all the variations of stress to which a reinforced structure is subject. The development of the theory of indeterminate structures involving rigid connections has been a natural consequence A later type of construction dispenses with beams and uses slabs and mushroom-headed piliars.

Reinforced concrete reached an established position as a constructional method in England when a joint committee, under the auspices of the Royal Institute of British Architects, considered and reported on the subject, first in 1907 and later in 1911. The report gave advice and guidance upon this form of construction in the absence of local regulations. As early as 1900 American engineers had developed the technique of reinforced concrete to a high degree

In 1915 the London County Council, using the authority vested in them under the clauses of the L.C C (General Powers) Act 1909, made regulations for the control of buildings erected in reinforced concrete While, in view of later developments and scientific investigation, these regulations are seen to be faulty, they were accepted at the time as a real help to the architect. builder and engineer, because at that time there was little general recognition of the more intricate problems involved in its use. The regulations include data for the practical design of beams, slabs, columns, foundations and walls, and a specification of materials and minimum strengths under test. These regulations now are in need of revision, because of the great advance in knowledge concerning this work. In the United States various changes have been made in the early rules with the result that more adequate requirements are in force

Owing to the experience gained in actual design and construction and to the greatly extended investigations which have been conducted into the properties of this new material, reinforced concrete appears not only low in maintenance cost, but is of satisfactory permanence. In addition it possesses fire-resisting qualities. Contradictory data, however, indicate that more knowledge of the action of concrete under various conditions is necessary before definite conclusions can be drawn. Owing mainly, perhaps, to the severely classical character of the normal architectural training, concrete cannot be said to have attained the same pre-eminence as a material for architectural expression as it has in construction However, some interesting, though perhaps exceptional, schemes have been produced by the so-called "modernist" architects and structural designers. (See also Con-CRETE and FERRO-CONCRETE.)

Structural Engineer and Architect.-It is recognized that structural engineering developed in its initial stages as a specialized branch of civil engineering, and its most prominent developments took place in connection with those pioneering ventures of mankind in the furtherance of which the skill and ability of the civil engineer is of paramount importance. Later developments, however, especially in countries where industrial and commercial carried out on April 28, Brandt suffering first conditions are now more stable, have resulted in establishing conditions in which the work of the structural engineer is, in nature and quality, much more closely related to that of the architect It follows, therefore, that as a knowledge of the theory and practice of structural engineering becomes more established and widespread, it will become more difficult to distinguish clearly between the work of the architect and that of the structural engineer in regard to the design and construction of tall fireproof buildings

There are at present, in all countries, numbers of architects who have prepared themselves to undertake responsibility both for architectural design and structural engineering in relation to all the forms of building in which they practise, the combination being most frequently found in continental countries. In Great Britain, where the private architectural practice still predominates. the employment of a structural engineer as a consultant, or as a specialist, appears to be the normal procedure. In view of the general recognition of the advantages of specialization, and of the difficulties inherent in scientific construction, there is little doubt that the structural specialist will remain a distinct and important person among those who are responsible for the design of future huldings

Building Skyscrapers in the United States.-The great demand for tall buildings that started at the end of the last century produced a new form of organization to handle their construction In the past the work was done on a divided contract where work was parcelled out to various contractors who worked under the supervision of the architect who had designed the Then, due to the magnitude and complication of the building work and the overburdening of the architect, the general contractor appeared, who was prepared to undertake the building of a skyscraper under a general contract in which he agreed to deliver the completed building on a given date. The contractor became a promoter, a financier, a buyer of materials, a large employer of labour, and principally an organizer who could combine all building trades and functions under a centralized management. The architect usually, therefore, became responsible only for architectural and structural design.

STRUENSEE, JOHAN FREDERICK, COUNT (1737-1772), Danish statesman, was born at Halle on Aug. 5. His father, subsequently superintendent general of Schleswig-Holstein, was a rigid pietist, but young Struensee, who settled down in the '60s as a doctor at Altona, revolted against his father's narrow creed and became a fanatical propagandist of the doctrines of the encyclopaedists. In 1768 he became court physican to Christian VII and rapidly gained authority in affaus.

For a time Struensee kept himself discreetly in the background, but he soon grew impatient of his puppets He dismissed the heads of departments, and abolished the Norwegian stadholderships. Henceforth the cabinet, with himself as its motive power, was to be the one supreme authority in the state. He then began to reform the administration and the law without regard to national customs and predilections Between March 29, 1771, and Jan 16, 1772-the ten months during which he held absolute sway-he issued no fewer than 1,069 cabinet orders, or more than three a day. In order to be sure of obedience he dismissed wholesale without pension or compensation the staffs of all the public departments, substituting nominees of his own.

The general ill will against Struensee, which had been smouldering all through the autumn of 1771, led to a conspiracy against him, headed by Rantzau-Ascheburg and others, in the name of the queen-dowager Juliana Maria. On Jan. 17, 1772 Struensee, E. Brandt, the unhappy king's keeper, and Queen Caroline were ar-rested, and "the liberation of the king," who was driven round Copenhagen by his deliverers in a gold carriage, was received with universal rejoicing The interrogation of Struensee began on Feb. 20, and on Feb. 22 he confessed that he had been Queen Caroline's lover On April 25 he and Brandt were condemned first to lose their right hands and then to be beheaded; their bodies were afterward to be drawn and quartered. The sentences were

STRUTHERS, a village of Mahoning county, Ohio, USA on the Mahoning river, 5 mi SE of Youngstown; served by the Pennsylvania and the Pittsburgh and Lake Erie railways (1950) 11,941 and was 11,739 in 1940 Struthers is a residential and industrial suburb of Youngstown, with large steel and iron works and various other manufacturing plants

STRUTHIONID AE: see OSTRICH

STRUTT, JEDEDIAH (1726-1797), British inventor and manufacturer, was born at South Normanton, Derbyshire, on July 28, 1726 He was educated at a country school, with a view to becoming a farmer, but he showed mechanical aptitude and in 1740 was apprenticed to a wheelwright at Findern near Derby During the time he was serving his apprenticeship, he inherited the stock on a farm at Blackwell near South Normanton While he was occupying the farm, his brother-in-law, William Woollatt, brought to his notice the unsuccessful efforts to produce ribbed as well as plain goods on the stocking frame, and he invented Strutt's Derby 1ibbing machine

Patents were taken out by Strutt and Woollatt in 1758 and 1750. Strutt then started a factory with Woollatt at Derby, and in 1762 took in Samuel Need as a partner. In 1768 Richard Arkwright (q v ) consulted Need as to the possibilities of his cotton-spinning frame Strutt at once realized its value, and was able to solve one or two minor difficulties which had interrupted the smooth working of the new mechanism. The firm of Arkwright, Strutt and Need started their first cotton mill at Nottingham with horse power.

Later works were erected at Cromford and, about 1780, after Strutt dissolved the partnership with Arkwhight, he built himself the mills at Belper and Milford. Shortly before this Strutt had made the discovery, which revolutionized the manufacture of calico, that cotton could be used throughout in its making. To house the machinery for this new invention the first fireproof mill in England was built at Derby In order to be near his work, Strutt built, from his own designs, Milford house, near Belper, where he lived until 1795, when ill health compelled him to return to Derby. He died there on May 6, 1797.

His eldest son, William Strutt (1756-1830), designed the calico factory at Derby He studied the house-heating problem and invented the Belper stove. He also devised a self-acting spinning mule, which, however, was not a great success. He was a fellow of the Royal society.

William Strutt's son, EDWARD STRUTT (1801-1880), was for some time M.P. for Derby, and in 1856 was raised to the peerage with the title of Baron Belper of Belper His political views were greatly influenced by Jeremy Bentham and James and John Stuart Mill. In later life he was considered an authority on such subjects as education, free trade and law reform. Like his father, he also was a fellow of the Royal society

STRUVE, FRIEDRICH GEORG WILHELM (1793-1864), German astronomer, made a systematic survey of the whole available sky for the discovery and measurement of visual double stars. Born at Altona on April 15, 1793, he attended the University of Dorpat, and was appointed to a professorship of astronomy and mathematics in 1813. He was summoned by Emperor Nicholas I of Russia in 1835 to superintend the building of the Pulkowa observatory, near St Petersburg; he became its director in 1839. He died on November 23, 1864.

Struve was a highly skillful observer. The catalogue in which his results were published, Mensurae Micrometricae, is one of the classics of double star astronomy. (W. W. M)

STRYCHNINE, an alkaloid discovered in 1818 in St. Ignatius's beans (Strychnos Ignatii); it also occurs in other species of Strychnos; e.g., S. Nur vomica, S. colubrina, S. Ticuté, and is from 1680 till 1724. He died at Hackney on Dec 11, 1737. He generally accompanied by brucine (dimethoxy strychnine) Strychnine crystallizes from alcohol in colourless prisms, practically insoluble in water, and with difficulty soluble in the common organic solvents Its taste is exceptionally bitter. It has an alkalme reaction, and is a tertiary monacid base

In Medicine.-The British Pharmacopoesa includes Easton's Syrup, syrupus ferri phosphatis cum quinina et strychnina, and Strychninae hydrochloridum which is much more soluble than strychnine. From it is prepared hquor strychnmae hydrochlorida The United States Pharmacopoeta contains strychmnae sulphas.

As regards its physiological action, strychnine enters the blood as such, being freely absorbed from mucous surfaces or when given hypodermically In small doses it acts as a bitter, increasing the secretion of gastric ruice. The specific effects of the drug, however, are upon the central nervous system. It excites the motor areas of the spinal cord and increases their reflex irritability Small doses increase the sensibility of touch, sight and hearing; large doses cause twitching of the muscles and difficulty in swallowing; while in overdoses violent convulsions are produced. The cerebral convolutions remain unaffected, but the important centres of the medulla oblongata are stimulated. Not only is the respiratory centre stimulated but the vasomotor centre is acted upon both directly by the drug and indirectly by the convulsion and asphyxia. Ordinary doses have no effect upon the temperature but in overdose the temperature rises during a convulsion. Strychnine is partly detoxified in the liver and partly excreted unchanged by the kidneys

In collapse following severe haemorrhage and arrest of the heart or respiration during chloroform narcosis an intramuscular injection of the hydrochloride may indirectly stimulate the cardiac action.

Toxicology.--/The symptoms of strychnine poisoning usually appear within twenty minutes of the ingestion of a poisonous dose, starting with stiffness at the back of the neck, twitching of the muscles and a feeling of impending suffocation. The patient is then seized with violent tetanic convulsions. After a minute the muscles relax, and the patient sinks back exhausted, consciousness being preserved throughout. Tetanus (q v.) resembles strychnine poisoning, but the development of the symptoms in tetanus is usually much slower, death rarely occurring within 24 hours.

In treating strychnine poisoning, antidotes such as charcoal or egg white should be administered promptly. Emetics should be avoided as they tend to precipitate convulsions. The patient should be kept quiet and protected from external stimuii. The convulsions can be best controlled by intravenous barbiturates or by ether. Artificial respiration may be necessary.

STRYJ, a town of U.S.S.R. formerly in the province of Stanislawow, Poland. Pop. (1930) 30,682. It is an important railway junction and a centre for the oil fields and the agricultural area of the province. Mineral gas is produced in the neighbourhood. The town is on the Stryj river. Soviet troops occupied Stryj in 1939; it was conquered by axis forces in 1941 and incorporated into U.S.S.R. in 1945.

STRYPE, JOHN (1643-1737), English historian and biographer, was born in Houndsditch, London, on Nov. 1, 1643. He was the son of John Strype, or van Stryp, a member of a Flemish family settled in Strype's Yard in Petticoat Lane, as a merchant and silk throwster. The younger John was educated at St. Paul's school, and at Jesus college, and Catherine Hall, Cambridge. In 1670 he became perpetual curate of Theydon Bois, Essex, and subsequently received the curacy of Leyton and a sinecure living in Sussex. He was lecturer at Hackney

torian, boin at Biala, near Bielsko, Teschen, Silesia, on March 7, 1862, became a professor at Graz in 1892 and was appointed professor of art history at the University of Vienna in 1909. He wrote numerous works on art, dealing especially with oriental influences on western art His works include. Byzantische Denkmaler, 1-3 (1891-93), Hellenistische und koptische Kunst in Alexandria (1902); Koptische Kunst (1903); Die bildende Kunst der Gegenwart (1907); Die Baukunst der Armemer und Europa (1918); Ursprung der christlichen Kirchenkunst (1920); Krisis der Geisteswissenschaften (1923); Der Norden in der bildenden Kunst Europas (1926); Die altslavische Kunst (1929); The Work of Clemens Holzmeister (1931); Assatische Miniaturmaleres (1932), Aufgang des Nordens (1936). He edited Early North European Church Art and Wood Architecture (1925). He was director of the first Institute for the History of Art in Vienna He died in Vienna on Feb. 2, 1941.

STUART, ARABELLA (1575-1615), daughter of Charles Stuart, earl of Lennox, younger brother of Lord Darnley and of Elizabeth, daughter of Sir William Cavendish and "Bess of Hardwick," was (by strict pedigree) next in succession to James VI. of Scotland to the thrones of England and Scotland, after Queen Elizabeth I. She became the centre of the intrigues of those who refused to accept James as Elizabeth's successor. Suitors for her hand included Henry IV. of France, the earl of Northumberland, and Esmé Stuart, duke of Lennox. In 1590 a scheme was formed of marrying her to Ranuccio, eldest son of the duke of Parma, who was descended from John of Gaunt, and of raising her with Spanish support to the throne She was regarded with suspicion by Elizabeth and closely guarded at Hardwick by the dowager countess of Shrewsbury. In 1602 the queen's suspicions were increased by the discovery of a plot to marry Arabella to Edward, eldest son of Lord Beauchamp, who as grandson of Edward Seymour, earl of Hertford, and of Lady Catherine Giey, was heir to the throne after Elizabeth according to Henry VIII.'s will. According to other accounts the intended husband was Thomas Seymour, a younger son of the earl of Hertford. Arabella planned an escape from Hardwick with the aid of her chaplain Starkey, who after its failure committed suicide In December she wrote secretly to Lord Hertford proposing her marriage with his grandson, but the latter immediately informed the council. In February 1603 another attempt at escape failed, and she was then transferred to the care of the earl of Kent at Wrest House. Arabella was received at the court of James I. and treated with favour, and she showed her fidelity to James by revealing a communication made to her by the conspirators in the Main and Bye Plots, in which her name had been used without her sanction. Every effort, however, was made to prevent her marriage. In December 1609 her plan to escape with Sir George Douglas to Scotland, apparently with a view of arranging a marriage with Stephen Bogdan, pretender to Moldavia, was discovered, and she was arrested. She was, however, granted a pension of £1,600 a year by James. In 1610 she was married secretly in despite of the King's prohibition to William Seymour, younger brother of Edward, and grandson of Lord Hertford. They were imprisoned, Arabella at Lambeth and her husband in the Tower. In 1611 she was placed in charge

of the bishop of Durham She escaped on June 3, 1611, and suc- Frankin's attack on "Stonewall" Jackson's Corps At Chancelceeded in boarding a ship bound for Calais. Her husband had also effected his escape and was sailing towards the French coast Arabella was captured and brought back to the Tower, where she spent the rest of her unhappy career She sank into melancholy, and, according to some accounts, insanity, and died on or about Sept 25, 1615 She was buried in the tomb of Mary Queen of Scots in Henry VII's chapel in Westminster Abbey

See also The Life and Letters of Arabella Stuart, by E T Bradley (1889), which supersedes the Life by E Cooper (1866); and Lives by M Letuse (1913), and B C. Bradley (1913).

STUART, GILBERT (1755-1828), American artist, was born at North Kingstown (RI) on Dec 3, 1755 He studied at Newport (RI) with Cosmo Alexander, and went with him to Scotland, but returned to America after Alexander's death, and obtained many portrait commissions. In 1775 he went to England, and became a pupil of Benjamin West in 1778. His work, however, shows none of the influence of West, and after four years Stuart set up a studio for himself in London. He painted George III and the future George IV, and in Paris he painted Louis XVI, and his success was no less great in Ireland After five years he left Iteland for his native land in order to paint Gen Washington, who was said to be the only person in whose presence Stuart found himself embairassed His first portrait Stuart felt was a failure; but Washington sat to him again, the result being the "Athenaeum" head on an unfinished canvas, showing the left side of the face. This remains the accepted likeness of Washington, of whom he also painted a full-length for Lord Lansdowne; of each of these portraits he executed many replicas Among his portraits are those of Presidents Washington, John Adams. Thomas Jefferson, James Madison, James Monroe and John Quincy Adams, and John Jay, Governor Winthrop, Generals Gates and Knox, Bishop White, Chief Justice Shippen, John Singleton Copley, Sir Joshua Reynolds, Benjamın West, Lords Clinton, Lyndhurst, and Inchiquin, Sir Edward Thointon, Mme. Patterson-Bonaparte and Horace Binney. Stuart's original colouring and technique, and his meight into character, make him not only one of the few great American artists, but one of the greatest portrait-painters of his time. He settled at Boston in 1805, and died there on July 9, 1828.

See George C. Muson, Life and Works of Gilbert Stuart (1879).

STUART, JAMES EWELL BROWN (1833-1864), American soldier, was born in Virginia on Feb 6, 1833 and entered West Point military academy in 1850 In 1859 Stuart, while staying in Washington on official business, was sent to assist Col R. E Lee in the suppression of the John Brown raid on Harper's ferry. Two years later when Virginia seceded from the Union Stuart resigned his commission in the United States army to share in the defence of his State. He had resigned as a ligutenant but he was at once made a colonel. With the scantiest of formal training his regiment was mustered into the Confederate army, and assigned to Joseph Johnston's force in the Shenandoah valley. At the first battle of Bull Run, Stuart distinguished himself by his personal bravery Later in the year 1861 he was promoted brigadier-general and placed in command of the cavalry brigade of the Army of Northern Virginia. Just before the Seven Days' battle (qv) he was sent out by Lee to locate the right flank of McClellan's army, and not only successfully achieved his mission, but rode right round McClellan's rear to deliver his report to Lee at Richmond. In the next campaign he had the good fortune, in his raid against Gen. Pope's communications, not only to burn a great quantity of stores, but also to bring off the headquarters' staff document of the enemy, from which Lee was able to discover the strength and positions of his opponents in detail. Stuart, now a majorgeneral and commander of the Cavalry Corps, was present at the second battle of Bull Run, and during the Maryland campaign he brilliantly defended one of the passes of South mountain (Crampton's gap), thus enabling Lee to concentrate his disseminated army in time to meet McClellan's attack At Fredericksburg Stuart's cavalry were as usual in the flank of the army, and his horse artillery rendered valuable service in checking

lorsville Stuart was specially appointed by Lee to take over command of the II Army Coips after Jackson had been wounded. The next campaign, Gettysburg, was preceded by the cavalry battle of Brandy station, in which for the first time the Federal Cavalry showed themselves worthy opponents for Stuart and his men. The march to the Potomac was screened by the Cavalry Corps, which held the various approaches on the right flank of the aimy, but at the crisis of the campaign Stuart was absent on a raid, and although he attempted to rejoin Lee during the battle, he was met and checked some miles from the field. Very shortly after the opening of the campaign of 1864 Stuart's corps was drawn away from Lee's army by the Union cavalry under Sheridan, and part of it was defeated at Vellow Tavein on May 10, and Stuart himself was killed

See Life by H. B. McClellan (1885).

STUART, JOHN McDOUALL (1815-1866), South Australian explorer, was born at Dysart in Fifeshine, Scotland, in 1815, and arrived in the colony about 1839 He accompanied (aptain Sturt's 1844-1845 expedition as draughtsman, and between 1858 and 1862 he made six expeditions into the interior, the last of which brought him on July 25 to the shores of the Indian ocean at Van Diemen's gulf, at the mouth of the Adelaide river He died June 5, 1866

STUBBS, WILLIAM (1825-1901), English historian and bishop of Oxford, son of William Morley Stubbs, solicitor, of Knareshorough, Yorkshire, was born on June 21, 1825, and was educated at the Ripon Grammar school and at Christ Chuich, Oxford, where he graduated in 1848, with a first class in classics and a third in mathematics He was elected a fellow of Trinity college in the same year, was ordained priest in 1850, and held the college living of Navestock, Essex, from 1850 to 1866. In 1862 he was appointed librarian at Lambeth, and in 1866 regius professor of modern history at Oxford. He held this chair tell 188.4 Many of his lectures were published in book form, including Seventeen Lectures on the Study of Mediaeval and Modern History, etc (1886, 3rd ed. 1900), Lectures on European History (1906), Germany in the Early Middle Ages (1908); and Germany in the later Middle Ages (1908) Stubbs aimed at the organization of a school of history in Oxford after the German model, but his lectures were thinly attended and he gave up the idea

As a historian Stubbs was eminent alike in ecclesiastical history, as an editor of texts and as the historian of the English Constitution In 1858 he published his Registrum sacrum anglicanum, which sets forth episcopal succession in England, and he edited with A. W. Haddan, vol iii. of Councils and Ecclesiastical Documents covering the History of the Anglo-Saxon Church (1878). He edited for the Rolls series 19 volumes of editions of the chronicles, among the most notable of which are the Gesta Regum of Wilham of Malmesbury (1867); the Gesta regis Henrici II. (1867); Roger Hoveden's Chronica (4 vols., 1868-71); the Memorials of St Dunstan (1874); The Historical Works of Ralph Diceto (1878) and The Historical Works of Gorvase of Canterbury (1879-90) The prefaces to these volumes contain some bulliant sketches of character.

His most famous work is his Constitutional History of England (3 vols., 1873, 75, 78, French trans. 1907), preceded by the Select Charters, and other Illustrations of English Constitutional History from the Earliest Times to the Reign of Edward I., in 1870. The appearance of the Constitutional History, which traces the development of the English Constitution from the Teutonic invasions of Britain till 1485, is a landmark in the study of mediaeval English history, and has not been superseded

In character Bishop Stubbs was modest, kind and sympathetic, ever ready to help and encourage serious students, generous in his judgment of the works of others, a most cheery companion, full of wit and humour. His wit was often used as a weapon of defence, for he did not suffer fools gladly. He died on April 22, 1901. In 1859 he had married Catherine, daughter of John Dollar, of Navestock, and had a numerous family.

Sec Letters of William Stubbs, Bishop of Oxford, edit. W. H. Hutton (1904).

purposes (See Plaster-Work )

STUCLEY (or STUKELY), THOMAS (c 1525-1578), English adventurer, son of Sir Hugh Stucley, of Affleton, near Ilfracombe, a knight of the body to King Henry VIII was supposed to have been an illegitimate son of the king. He was a standardbearer at Boulogne from 1547 to 1550, entered the service of the duke of Somerset, and after his master's arrest in 1551 a warrant was issued against him, but he escaped to France, and served in the French aimy. He was sent by Montmorency with a letter of recommendation from Henry II of France to Edward VI On ais airival he pioceeded on Sept 16, 1552, to reveal the French plans for the capture of Calais and for a descent upon England. which had, according to his account, been the object of his mission to England. Stucley was imprisoned in the Tower for some months A prosecution for debt on his release in Aug 1553 compelled him to become a soldier of fortune once more, but he returned to England in Dec 1554 in the train of Philibert, duke of Savoy. He mairied an heiress, Anne Curtis, but in a few months had to return to the duke of Savoy's service From 1558 onward he seems to have been engaged in buccaneering, and although Elizabeth was compelled to disavow Stucley, who surrendered in 1565, his prosecution was merely formal

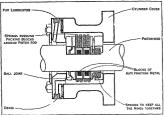

Stucley was then engaged by Sir Henry Sidney in Ireland, then by Bertrand de Salignac Fénelon, the French ambassador in London, and then by Philip II of Spain, but he fell into disgrace at Madrid. But he commanded three galleys, under Don John of Austria at the battle of Lepanto, and exploits restored him to favour at Madrid. On March 2, 1572, he was at Seville, offering to hold the narrow seas against the English with a fleet of 20 ships In four years (1570-74) he is said to have received more than 27,000 ducats from Philip II. Wearied by the Spanish king's delays he sought assistance from Gregory XIII, who aspired to make his illegitimate son, Giacomo Buoncompagno, king of Ireland He set sail from Civitavecchia in March 1578, but put into Lisbon, where he was to meet his confederate, James Fitzmaurice Fitzgerald, and to secure better ships before sailing for Ireland There he was turned from his purpose by King Sebastian, with whom he sailed for Morocco. He commanded the centre in the battle of Alcasar on Aug. 4, 1578, and was killed.

There is a detailed biography of Studey, based chiefly on the English, Venetian and Spanish state papers, in R. Simpson's edition of the 1605 play (School of Shakespeare, vol. 1 [1878]), where the Studey ballads are also printed.

STUDEBAKER CORPORATION, THE, incorporated under the laws of the state of New Jersey on Feb 14, 1911, at that time acquiring the assets of the Studebaker Brotheis Manufacturing company, formed in 1868, and the Everitt-Metzger-Flanders company, organized in 1908. The Studebaker Brothers Manufacturing company succeeded the firm of H and C. Stude-baker, established in 1852. In March 1935, a reorganization of the capital structure was effected and a new company bearing the same name (The Studebaker corporation) was organized under the laws of the state of Delaware. (H. E. DA)

STUFFING BOX is a device to prevent leakage by a piston or ram or spindle as it passes into a cylinder sustaining pressure, This applies to steam engines, air compressors, some kinds of pumps, hydraulic machinery, many stop valves, throttle valves, and water fittings. The main element in each instance is the gland, which is forced along by a thread, or by two or more screws pressing its flange. A chamber surrounding the rod or spindle contains the stuffing or packing, and this becomes compressed around the rod to form a nonleaking joint. Big glands have the nuts of the holts driven in unison by a gear to produce equable tightening all around the circle. A packing commonly used is hemp, though to withstand heat asbestos mixtures are chiefly employed, and are charged with graphite so as to give a constant lubicating effect. Metallic packings have largely superseded any kind of fabrics, the stuffing box containing an arrangement of white-metal

STUCCO, a kind of plaster used for the covering of walls, or pads, with spings to compress them around the rod, the steam pressure further assists in making a tight joint. The drawing etc, or for ceilings. The stucco used as an exterior covering for shows the Lancaster and Tonge packing, in which the encircling

STUFFINGS OR FORCEMEATS. These are used puncipally to give extra flavour to certain flesh foods and vegetables, to bring out the flavour of others, and as additions to some dish such as jugged hare, in the form of forcemeat balls or quenelles Bread, crumpled, moistened and seasoned, is the foundation of many forcemeats A simple US formula is 2 cups dry bread crumbs to 1/2 cup hot water, 1/2 teaspoon salt, 1/4 teaspoon pepper, sometimes varied by the substitution of milk or stock (especially chicken stock) for water A plain English recipe calls for 4 oz. bread scraps to half the amount of suet, one egg, salt, pepper and some form of seasoning, e g, parsley or mixed herbs. Either recipe may be elaborated by adding chopped onion, sage, nutmeg or ground nuts Chestnut, mushroom, oyster and potato forcemeats are good for poultry, minced giblets being often added Fruit stuffings are especially good for strong-flavoured birds like duck and goose.

STUKELEY, WILLIAM (1687-1765), English antiquary, was born at Holbeach, Lincolnshire, on Nov 7, 1687 His principal work, an elaborate account of Stonehenge, appeared in 1740, and he wrote conjously on other supposed Druid remains, becoming familiarly known as the "Arch-Druid" He died in London on March 3, 1765.

STUMPF, CARL (1848-1936), German psychologist and philosopher, was born at Wiesentheid, Bayaria, April 21, 1848, He studied first at Wurzburg under Franz Brentano, and later at Gottingen under Rudolf Lotze He was greatly influenced in his philosophy and psychology by these two men, and remained loyal to them He was appointed to the chair of philosophy at Wurzburg (1873), Prague (1879), Halle (1884), Munich (1889) and finally Berlin (1894) where he was professor of philosophy and director of the psychological laboratory. In 1900 he founded the phonogram-archivs, which consist of a collection of phonograph records of primitive music. In 1907-08 he was rector of Berlin university. In 1921 he reached the age limit, and retired from active teaching

In 1921 he reached the age limit, and retured from active teaching His chief publications included. Uebe den spychologische IUrjeung der Raumworstellung (1873), Tonhyschologise (1883-90); "Ueber den Begriff der mathematischen Wahleschenchkeit," 3th bayr Ak (1893); Ueber Leb und Seele (1867), Beiträge zur Akustia und Manheusen-Prychol. STUDA, in architecture, a specific type of Buddhist religious building, consisting of a solid mass of masonry, built above a receptacle containing a sacred relic. In India it is commonly called a tope (qv) Although the origin of the stupa was probably the more primitive tumulus, or mound of earth over a grave, its development in historic times was toward greater and greater height and richness of treatment Outside of Thète and China, a profile generally contical and of gieat height was developed, as in the famous gilded example in the centre of the Shwe Dagon, in Rangoon The Thietan from, developed to a great degree of beauty and richness in China, has a bulbous silhouette, wideen near the top than at the bottom.

STURDEE, SIR FREDERICK CHARLES DOVE-TON (1859-1925), Butish sailor, was born at Charlton, Kent, on June 9, 1859, and entered the navy in 1871. He was promoted heutenant (1880), commander (1893), captain (1899), real-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921) He saw service in Egypt (1882) and in Samoa (1899), when he was in command of the Anglo-American force He was assistant director of naval intelligence to the Admiralty (1000-02) and chief of staff, Mediterranean Fleet (1005-07) and Channel Fleet (1907) In 1910 he became rear-admiral of the first battle squadron, and commanded the 2nd cruiser squadron (1912-13) During the World War Sturdee was made chief of the war staff in Nov 1914 As commander-in-chief in the south Atlantic and Pacific, he led the squadron which won the battle of the Falkland islands (Dec 8, 1914), and he was in command of the 4th battle squadron when it took part in the battle of Tutland He was created KCB in 1913, KCMG in 1916, and a baronetcy was conferred on him in 1916, with the title "of the Falkland islands" From 1018-21 he was commander-in-chief at the Nore He died on May 7, 1925.

STURDZA or STURZA, the name of an ancient Rumanian family, of unknown origin, which probably came from Trebizond and settled in Moldava. The Sturdza family has been long and intunately associated with the Government first of Moldava and afterwards of Rumana Its members belong to two man divisions, which trace their descent respectively from John (Loan) or from Alexander (Sandu), the sons of Klück Sturdza, who lived in the ryth century, the founder of the family.

I. To the first division belongs Michael Strupza. (1795–184), prince of Moldsviar from 1844 to 1849. A man of liberal education, he established the first high school, a kind of university, in Jassy. He brought scholars from foreign countries to act as teachers, and gave a very powerful stimulus to the educational development of the country. In 1844, he decreed the enancipation of the gypaies. Until then the gypaies had been treated as slaves and owned by the Church or by private land-owners, they had been bought and sold in the open market. Michael Sturdan also attempted the secularization of monastic establishments, which their endowments for national purposes. Under his rule the internal development of Moldavia made immense progress; toads were built, industry developed, and Michael is still rariefully remembered by the people.

See Michel Stourdsa et son administration (Brussels, 1834), Michel Stourdsa, ancien prince regnant de Moldavie (1874); A. A. C. Sturdza, Règne de Michel Sturdza, prince de Moldavie 1834-1849 (1907).

2 GREGORY [Gigorie] STURDA (1821—1921), son of the above, we deducted in France and Germany, became a general in the Ostoman army under the name of Müklis Pasha, and afterwards attained the same rank in the Moldavan army. He was a candidate for the Moldavan throne in 1859, and subsequently a prominent member of the Russophil party in the Rumanian pailament. He worde Loss fondamentales de l'unwors (Paris 1891).

3. John [Ioan] Sturzza, prince of Moldava (182-1828), was the most famous descendant of Alexander Sturdza Immediately after the Greek revolution, Prince John Sturdza took an active part in subduing the 100mg bands of Greek Efetairists in Moldava, he transformed the Greek elementary schools into Rumainau schools and laid the foundation for that scientific antional development which Prince Michael Sturdza continued after 1834 In 1838 the Russians entered the country and took Prince Iohn prince The ded in exile

4 DFMFINITIS [Drumtine] STUREAR (1833-1914), Rumanian statesman, was born in 183 at Jassy, and educated there at the Academa Michaileana. He continued his studies in Germany, took part in the political movements of the time, and was private secretary to Prince Cuzz. Demetrius afterwards turned against Cuzz, joined John Bratlanu, and became a member of the so-called Liberal Government. In 1899 he was elected leader of the party in succession to Brathanu and was four times prime mimister He died at Buchailest on Oct 21, 1914. (M. G.)

STURE, STEN, commonly called the Younger (1492—1520), succeeded his father Svante (d. 1512) as regent of Sweden. His regency was wrecked by the feud between the Sture and Trolle families, and his own personal feud with Gustaf Trolle, who invoked the aid of Christian II of Demmark. The war with Denmark was begun in 1516 and resumed in 1518, and in 1520 cull-united in the battle near Borgerund on Lake Aarunden (Jan. 19) At the very beginning Sture was hit by a bullet and his peasant levels field to the wild mountainous regions of Trovelen where they made a last desperate but unsuccessful stand. The mortally-wounded regent took to his sledge and posted towards

STURGE, JOSEPH (1793-1789). English philanthropast and politicans, was the son of a farmer in Gloucestenbire, and settled in 13:2 in Birmingham, where he died on May 14, 1859. Its life was given to agitation for the abolition of slavery, into to the bettement of the conditions of the liberated slaves, and lastly to the cause of peace and arbitration. He was one of the founders in 1855 of the Morning Star, a paper established in the peace interest, a Quaker; and a friend of the Charitsts

Stockholm, but expired on the ice of Lake Malar two days later

STURGEON (Aciponser), a small group of fishes, of which some 20 species are known, from European, Assatic and North American rivers The distinguishing characters of this group are dealt with in the article Fishins Most of them pass a great part of the year in the sea, but pendically ascend large rivers, some in spring to deposit their spawn, others later in the season for some purpose unknown; a few are confined to fresh water. None occur in the tropics or the southern hemisphere By a decree of Edward II. Enclish sturesons are the property of the king.

Sturgeons are found in the greatest abundance in the rivers of southern Russia, more than 10,000 fish being sometimes caught at a single fishing station in the fortinght of the upstream migration, and in the fresh waters of North America In Russia the fisheries are of immense value. Early in summer the fish migrate into the rivers or towards the shores of fresh-water lakes in large shoals for breeding purposes. The own are small and numerous The growth of the young is rapid. After the sturgeon attains the growth of the young is rapid. After the sturgeon attains attain great age, and won Buer claimed that observations made in Russia indicate that the Hausen (A. hao), may attain an age of between 200 and 200 years. Sturgeons ranging from \$6 to 1 it it in length are by no means searce, and some species grow to a much larger size. Sturgeons are ground-feeders. The more important species are.

1. The common sturgeon of Europe (A sturio) occurs on all

the coasts of Europe, but is absent from the Black sea. It is not rare on the coasts of North America. It reaches a length of 12 of t., and is always caught singly, or in pairs. The four of its snout varies with age (as in the other species), being much more blunt and abbreviated in oid than in young examples. There are

11-13 bony shields along the back and 29-31 along the body.

2. A. guldenstadtis is one of the most valuable species of the rivers of Russia; it inhabits the Siberian rivers also, eastwards

as far as Lake Baikal. It attains the same size as the common sturgeon, and abounds in the rivers of the Black and Caspian seas.

ers of the Black and Caspian seas, 3 A stellatus occurs in abundance in the rivers of the Black sea and of the Sea of Azov. It has a long and pointed snout, like seatch that the sterlet, but simple barbels THE of the sterlet in the

the sterlet, but simple barbels The common sturgeon (acipenwithout fringes. Though growing SER STURIO)

only to about half the size of the preceding species it is of no less value, its flesh being more highly esteemed and its caviare and isinglass fetching a higher price.

4. The sturgeon of the great lakes of North America (A. rubicundus) has been made the object of a large industry at various places on Lakes Michigan and Erlo. The sturgeons of the lakes are unable to migrate to the sea, but those below the Falls of Nigarar are great wanderers.

5. A. have is recognized by the absence of osseous scutes on the mout and by its flattened, tape-like barbels. It is one of the largest species, reaching the length of 24 ft., and a weight of 2000 Ib. It inabilist the Caspian and Black easa, and the of Azov, Its flesh, caviare and air bladder are of less value than those of the smaller kinds.

The steriet (A. ruthenus) is one of the smaller species, which inhabits both the Black and Caspian seas.

The family Acienseridae includes one other genus, Scaphirhynchus, the shovelhead or shovel-need sturgeon, distinguished by the long, broad and flat snout, the suppression of the spiracles, and the union of the longitudinal rows of scales posteroriy. All the species are confined to fresh water. One of them is common in the Mississippi and other rivers of North America, the other three occur in the larger tures of eastern 42.

three occur in the larger nvers of eastern Asia.

STURGEON BAY, a city of northeastern Wisconsin,
U.S.A, on the narrow peninsula (there 8 ml. wide) between
Green bay and the main body of Lake Michigan. The county
seat of Door county. It lies on Stutgeon bay (an inlet of Green
bay, connected with Lake Michigan by a ship canal) and is served
by the Ahnapee & Western railroad (freight only) and lake
steamers. Pop. (1950) 7/654; (1940) 5/439. The peninsula is a
region of great natural beauty, and the city is a summer resort and
trading centre. The annual cherry crop amounts to about 3,000,
tating the control of the county of the county of the county
start fish batchery in the city and other industries. The city was
incorporated in \$83.

STURGIS, RUSSELL (1836-1909), American architect and art critic, was born in Baltimore county, Maryland, on Oct. 16, 1836. He graduated from the Free Academy in New York (now the College of the City of New York) in 1856. He studied architecture under Leopold Eidlitz and then for two years in Munich. In 1862 he returned to the United States. He designed the Yale University chapel and the Farnham and Durfee dormitories at Yale, the Flower Hospital, New York, the Farmers' and Mechanics' Bank, Albany, and many other buildings. After 1880 he did comparatively little professional work. He was in Europe in 1880-84. For a short time after his return he was secretary of the New York municipal civil service board. He was president of the Architectural League of New York in 1889-03. was first president of the Fine Arts Federation in 1895-97, and was a member of the National Society of Mural Painters, the National Sculpture Society, the National Academy of Design, and the New York chapter of the American Institute of Architects. He lectured on art at Columbia University, the Metropolitan Museum of Art in New York, the Peabody Institute of Baltimore and the

Art Institute of Chicago. He edited A Dictionary of Architecture and Building (3 vols, 1501-02) and the English version of Wilhelm Luckke's Outlines of the History of Art (2 vols, 1594), and he wrote European Achitecture (1595), How to Indige Architecture (1595), The Appleatation of Sculptine (1594), The Appleatation of Sculptine (1595), A Study of the Artist's Way of Working in the Various Handleroffst and Arts of Design (2 vols, 1595) and an unfinished History of Architecture (1596 et seq.). He died in New York Feb. 11, 1594

STURGIS, a city of Michigan, U.S.A. The population was 7,786 in 1950, 7,214 in 1940 and 6,950 in 1930.

It is in a nich agricultural region, and has a large number of diversified manufacturing industries. The city has a commissionmanagement.

STURGKH, CARL, COUNT (1859-1916), Austrian politician, was born at Graz on Oct. 30, 1859, of an ancient Styrian family. In 1891, he entered the Reichsrat as representative of the constitutional landed proprietors, achieving some prominence as a keen opponent of universal suffrage. He was from Feb. 10, 1909 to Nov. 3, 1911 minister of education, and a zealous advocate of the humanistic education traditional in the gymnasia. On Nov. 3 he became prime minister, and formed a cabinet with-out regard to nationality. Owing to the incessant parliamentary obstruction, however, Sturgkh prorogued parliament indefinitely on March 16, 1914, with an announcement that "Parliaments were only means to an end, and where they failed, other means must be employed," So on the outbreak of World War I, Austria was without a parliament, and the decisions lay with its few rulers alone. Sturgkh was one of the committee of five ministers who decided on the ultimatum to Serbia. He refused to convoke parliament, and as a protest against this the Social Democrat, Friedrich Adler, assassinated him in a Viennese restaurant on Oct. 21, 1916 (see Austria, Empire of)

STURM, JACQUES CHARLES FRANÇOIS (1802-1851), French mathematician, of German extraction, was born at Geneva on Sept. 29, 1803, and spent most of his life in Paris. In 1839 he discovered the theorem regarding the determination of the number of real roots of a numerical equation included between given limits, which bears his name. (See Equatrons, Tracory or.) He was elected to the Académie des Sciences in 1836, was professor in the Ecole Polytechnique in 1849, and finally succeeded Poisson in the chair of mechanics in the Faculté des Sciences in Paris. He ded in Paris on Doc. 18, 1855.

His works, Cours d'analyse de l'école polytechnique (1857-68) and Cours de Mécanque de l'école polytechnique (1861), were published posthumously.

STURMER, BORIS VLADIMIROVICH (1849-1917), Russian politician, was of German origin. His father was captain of a fire brigade at Tula. He studied at the University of St. Petersburg (Leningrad). He started his career in the chamberlain's department of the imperial court. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver zemstvo, Sturmer, whose name was on the list of the Tver gentry, was appointed to this office. It was the first case of a president being appointed instead of elected. In 1804 Sturmer was appointed governor of the Novgored, and later of the Yaroslavl province. In Jan. 1916, he was made prime minister. He was opposed in liberal and patriotic circles. Accusations of connections with Germany were brought to the Duma by Milyukov and resulted in Sturmer's resignation in Nov. 1916. After Sazonov's dismissal Stürmer took the portfolio of foreign affairs. He was arrested after the revolution, and

died in prison in Sept. 1927.

STURM VON STURMECK, JACOB (1489-1553), German statesman and reformer, was born at Strasbourg on Aug. 70.

489. He was educated at the universities of Heddelberg and Freiburg, and about 1517 he entered the service of Henry of Withelbach, provost of Strasbourg (d. 1552). He soon became an adherent of the reformed electrines, and a member of the town council in 1524. He was responsible for the policy of Strasbourg during the Peasants' War; represented the city at the diet of Speyer in 1526 and at subsequent diets. He took part in the con-

ference at Marburg in 1529; but when the attempts to close the breach between Lutherans and Zwinglians failed, he presented the Confessio tetrapolstana to the Augsburg duet of 1530. As the representative of Strasbourg Sturm signed the "protest" which was presented to the diet of Spires in 1529, being thus one of the original "Protestants" Owing largely to his influence Strasbourg toined the league of Schmalkalden in 1531. In Feb. 1547 the citizens were compelled to submit to Charles V Sturm obtained for his native city some modification of the Interim issued from Augsburg in May 1548. He died at Strasbourg on Oct. 30, 1553. See H. Baumgarten, Jakob Sturm (Strasbourg, 1876), A. Baum, Magistrat und Reformation in Strassburg bis 1529 (Strasbourg, 1887). STURNIDAE: see Starling

ŠTURSA, JAN (1880-1925), the leader of the modern school of Czech sculpture, was born at Nové Město in Moravia. In 1899 he entered the Academy of Fine Arts at Prague as a pupil of Myslbek His early works manifest the influence of the symbolic literature of that period, but by 1905-7 he had already attained an individual expression in such works as "Puberty (1905), "The Melancholy Girl" (1906) and "Primaveia" (1907). A journey to Italy in 1907 was the opening of a new epoch in his creative work. His admiration for femininity is manifested in "Eve" (1908, State Gallery, Munich), "Hetaira" (1909), "Messalina" and the monumental representation of the dancer "Sulamith Rahu" (1911), now in the gallery at Venice. He interpreted the opposite feminine type of intellectuality in the monument to Hana Kvapilova (1912), the Czech actress. During the same period Stursa produced the group of statuary for the pylons of the Hlavka Bridge at Prague. In 1916 he was appointed professor at the Academy of Fine Arts in Prague, and in this period of his artistic maturity he created the "Wounded Man," He produced a number of portrait busts, the most noteworthy being "President Masaryk." He died in Prague on April 28, 1925 STURT, CHARLES (1795-1869), English explorer, born in

Bengal Having landed in Australia with his regiment (the 39th), he started on a first expedition (1828) discovering the Darling river, while a second made known the existence of Lake Alexandrina. From his third journey (1844-1845), in which terrible hardships had to be endured, he returned quite blind, and he never altogether recovered his sight. He was appointed surveyor-general of South Australia in 1833, and subsequently chief secretary until 1856 when responsible government was introduced. Sturt died at

Cheltenham, England, on June 16, 1869

STURZO, LUIGI (1871-), Italian priest and political organizer, promoter of the Christian Democratic movement in Italy. Born at Caltagirone, Sic, on Nov. 26, 1871, he studied at the Gregorian university, Rome, and became professor of philosophy and sociology in his native town. On the outbreak of World War I he went to Rome as secretary of Azione Cattolica (Catholic Action) In 1919 he founded the Partito Popolare and became its first political secretary. Sturzo and his party based themselves on papal encyclicals concerning the social order and advocated reforms of a radical nature, especially in agriculture; the majority of the party's adherents were peasants.

At the elections of Nov. 1919 the newly founded Partito Popolare secured for seats and became a dominant force in politics, if not with the Giolitti cabinet certainly during the subsequent Bonomi cabinet After the Fascist "march on Rome" several Popolari entered the first Mussolini cabinet, but soon he and his party joined the opposition. In 1923, however, the Vatican, subjected to pressure from Mussolini, withdrew its support from Sturzo in an attempt to reach some understanding with the Fascists Sturzo's party had by now much shrunk as an outcome of Fascist electoral methods. He resigned the leadership in 1923 and left Italy in Oct. 1924. Sturzo spent his 20 years of exile first in London and after the outbreak of World War II in the U.S. His party in Italy was driven underground, but after the overthrow of Fascism many of his ideas re-emerged in the Christian Democratic party, headed by Alcide de Gasperi and other followers of Sturzo's who revered him as the father of their ideas. He returned to Italy after the war and was made a senator for life in 1952.

(1939), Italy and the Coming World (1945) and numerous other work not translated into English

STUTTGART, capital of Wurttemberg-Baden, Germany Pop including suburbs (1950) 497,677. Stuttgart seems to have originated in a stud (Stuten Garten) of the early counts of Wurttemberg, and is first mentioned in a document of 1229 In its early history it was overshadowed by Cannstatt. Ever at the beginning of the 19th century it did not contain 20, 000 inhabitants, and its real advance began with Kings Frederick and William I. Few of its principal buildings are older than the 19th century They illustrate the revival of the Renaissance style Of the churches in the city the most interesting are the Stiftskirche, with two towers, a fine specimen of 15th-century Gothic: the Leonhardskirche, also a Gothic building of the 15th century; and the Hospitalkırche, restored in 1841, the clossters of which contain the tomb of Johann Reuchlin. A large proportion of the most prominent buildings are clustered round the Schlossplatz. Among these are the new palace, a structure of the 18th century, finished in 1807; the old palace, a 16th-century building, and the so-called Akademic, formerly the seat of the Karlschule, where Schiller received part of his education, and now containing a library. On or near the Schlossplatz also are the new courts of justice; and the central railway station

The art collections of Stuttgart are numerous and valuable. The museum of art comprises a picture gallery, a collection of casts of Thorvaldsen's works and a cabinet of engravings. The library contains many thousands of printed volumes and manuscripts, including one of the largest collections of Bibles in the world. The technical high school, which after 1899 possessed the right to confer the degree of doctor of engineering, practically enjoys academic status and so does the veterinary high school.

Stuttgart is the centre of the publishing trade of south Germany. Its other manufactures include machinery, pianos and other musical instruments, cotton goods, linen, gloves, rubber, jewellery, chocolate, lamps, cigars, furniture, leather, paper, colours and chemicals. The Daimler-Benz factory for aircraft engines, trucks, and tanks, the Bosch plant for electrical equipment, and the important railway yards made Stuttgart an object of air raids during World War II.

STUYVESANT, PETER (1592-1672), Dutch colonial governor, was born in Scherpenzeel, in Southern Friesland, in 1502. He studied at Francker, entered the military service in the West Indies about 1625, and was director of the West India Company's colony of Curação 1634-44. In April, 1644 he attacked the Por-tuguese island of Saint Martin and was wounded; he had to return to Holland, and there one of his legs was amoutated Thereafter he wore a wooden leg ornamented with silver bands. In May, 1645, he was selected by the West India Company to supersede William Kieft as director of New Netherland. He arrived in New Amsterdam (later New York) on May 11, 1647, and was received with great enthusiasm. In response to the demand for self-government, in Sept , 1647, he and the council appointed-after the manner then followed in Holland-from 18 representatives chosen by the people a board of 9 to confer with him and the council whenever he thought it expedient to ask their advice.

The leading burghers were, however, soon alienated by his violent and despotic methods, by his defence of Kieft, and by his devotion to the interests of the company; the nine men became the centre of municipal discontent, and a bitter quarrel ensued. In 1650 the states-general suggested a representative government to go into effect in 1653, but the company opposed it; in 1653, however, there was established the first municipal government for the city of New Amsterdam modelled after that of the cities of Holland. Stuyvesant also aroused opposition through his efforts to increase the revenues of the company, to improve the system of defence, and to prevent the sale of liquor and firearms to the Indians, and through his persecution of Lutherans and Quakers. to which the company finally put an end. In 1650, he came to an agreement with the commissioners of the united colonies of New England at Hartford upon the boundary between New Netherland fter the war and was made a senator for life in 1952.

and Connecticut, involving the sacrifice of a large amount of

territory. On Long Island, during Stuyvesant's rule, Dutch in4.88 STYLE

fluence was gradually undermined by John Underhill Stuyve- mental brain-work" must always have a leading place sant's dealings with the Swedes were more successful. With a force of 700 men he sailed into the Delaware in 1655, captured Ft Casimir (Newcastle)-which Stuyvesant had built in 1651 and which the Swedes had taken in 1651-and overthrew the Swedish authority in that region. He also vigorously suppressed Indian uprisings in 1655, 1658 and 1663

In March, 1664, Charles II granted to his brother, the duke of York, the territory between the Connecticut river and Delaware bay, and Col Richard Nicolls with a fleet of 4 ships and about 300 or 400 men was sent out to take possession. Misled by instructions from Holland that the expedition was directed wholly against New England, Stuyvesant made no preparation for defence until just before the fleet arrived. As the burghers refused to support him, Stuyvesant was compelled to surrender the town and fort on Sept 8 He returned to Holland in 1665 and was made a scapegoat by the West India Company for all its failings in New Amsterdam, he went back to New York again after the treaty of Breda in 1667, having secured the right of free trade between Holland and New York He spent the remainder of his life on his farm called the Bouwerie, from which the present "Bowery" in New York city takes its name He died in Feb 1672, and was buried in a chapel, on the site of which in 1799 was erected St Mark's church.

See Bayard Tuckerman, Peter Stuyvesant (1893), in the "Makers of America" Series, and Mrs Schuyler Van Rensselaer, History of the City of New York in the Seventeenth Century (1909)

STYLE. It is desirable to insist at the outset on the dangers of a heresy which found audacious expression towards the close of the 19th century, namely, that style is superior to thought and independent of it Against this may be set at once one of the splendid apophthegms of Buffon, "Les idées seules forment le fond du style." Before there can be style there must be thought, clearness of knowledge, precise experience, sanity of reasoning power. A confusion between form and matter has often confused this branch of our theme. Even Flaubert, than whom no man ever gave closer attention to the question of style, seems to dislocate them For him the form was the work itself "As in living creatures, the blood, nourishing the body, determines its very contour and external aspect, just so the matter, the basis, of a work of art imposes, necessarily, the unique, the just expression, the measure, the rhythm, the form in all its characteristics" This ingenious definition seems to strain language beyond its natural limits If the adventures of an ordinary young man in Paris be the matter of L'Education sentimentale it is not easy to admit that they "imposed, necessarily," such a "unique" treatment of them as Flaubert so superlatively gave. They might have been recounted with feebler rhythm by an inferior novelist, with bad rhythm by a bad novelist and with no rhythm at all by a police-news reporter What makes that book a masterpiece is not the basis of adventure, but the superstructure of expression. The expression, however, could not have been built up on no basis at all, and would have fallen short of Flaubert's aim if it had risen on an madequate basis. The perfect umon is that between adequate matter and an adequate form. We will borrow from the history of English literature an example which may serve to illuminate this point. Locke has no appreciable style; he has only thoughts. Berkeley has thoughts which are as valuable as those of Locke, and he has an exquisite style as well. From the artist's point of view, therefore, we are justified in giving the higher place to Berkeley, but in doing this we must not deny the importance of Locke. If we compare him with some pseudo-philosopher, whose style is highly ornamental but whose thoughts are valueless, we see that Locke greatly prevails. Yet we need not pretend that he rises to an equal height with Berkeley, in whom the basis is no less solid, and where the superstructure of style adds an emotional and aesthetic importance to which Locke's plain speech is a stranger. At the same time, an abstract style, such as that of Pascal, may often give extreme pleasure, in spite of its absence of ornament, by its precise and pure definition of ideas and by the just mental impression it supplies of its writer's power and placidity of mind. But whether in the abstract or concrete style, what Rossetti called "funda-

When full justice has been done to the necessity of thought as the basis of style, it remains true that what is visible, so to speak, to the naked eye, what can be analysed and described, is an artistic arrangement of words. Language is so used as to awaken impressions, and these are roused in a way peculiar to the genius of the individual who brings them forth. The personal aspect of style is therefore indispensable, and is not to be ignored even by those who are most rigid in their objection to mere ornament Ornament in itself is no more style than facts, as such, are thought In an excellent style there is an effect upon our senses of the mental force of the man who employs it D'Alembert said of Fontenelle that he had the style of his thought, like all good authors In the words of Schopenhauer, style is the physiognomy of the soul in the Renaissance phrase, it is mentis character All these attempts at epigrammatic definition tend to show the sense that language ought to be, and even unconsciously is, the mental picture of the man who writes

To attain this, however, the writer must be sincere, original and highly trained. He must be highly trained, because, without the exercise of clearness of knowledge, precise experience and the habit of expression, he will not be able to produce his soul in language. Nor can anyone who desires to write consistently and well, aftord to neglect the laborious discipline which excellence entails. He must never rest until he has attained a consummate adaptation of his language to his subject, of his words to his emotion. This is the most difficult aim which the writer can put before him Perfection is impossible, and yet he must never desist from pursuing perfection

> "If all the pens that ever poets held Had fed the feeling of their masters' thoughts, And every sweetness that inspired their hearts, Their minds, and muses, on admired themes If all the heavenly quintessence they 'still From their immortal flowers of poesy, Wherein, as in a mirror, we perceive The highest reaches of a human wit-If these had made one poem's period, And all combined in beauty's worthiness Yet should there hover in their restless heads One thought, one grace, one wonder, at the least Which into words no virtue can digest."
>
> —Marlowe, Tamburlaine the Great

Flaubert believed that every thought or grace or wonder had one word or phrase exactly adapted to express it, and could be "digested" by no other without loss of clearness and beauty It was the passion of his life, and the despair of it, to search for this unique phrase in each individual case Perhaps in this research after style he went too far, losing something of that simplicity and inevitability which is the charm of natural writing. The greatest writing is that which in its magnificent spontaneity carries the reader with it in its flight; that which detains him to admire itself can never rise above the second place Forgetfulness of self, absence of conceit and affectation, simplicity in the sense not of thinness or poorness but of genumeness-these are elements essential to the cultivation of a noble style. Here again, thought must be the basis, not vanity or the desire to astonish. We do not escape by our ingenuities from the firm principle of Horace, "scribendi recte sapere est et principium et fons.

Of the errors of style which are the consequences of bad taste, it is difficult to speak except in an entirely empirical spirit, because of the absence of any absolute standard of beauty by which artistic products can be judged. That kind of writing which in its own age is extravagantly cultivated and admired may, in the next age, be as violently repudiated; this does not preclude the possibility of its recovering critical if not popular favour. Pethaps the most remarkable instance of this is the revolt against Ciceronian prose which occurred almost simultaneously in several nations toward the middle of the 16th century and in England is best represented by Lyly in his celebrated Euphues. Montaigne in France and Castiglione in Italy, by their easiness and brightness, their use of vivid imagery and their graceful illumination, marked the universal revulsion against the Ciceronian stiffness. Each of these new manners of writing fell almost immediately into desuecame into vogue (Joseph Addison, Jacques Bossuet, Giovanni Vico, Samuel Johnson) In the 19th century admiration of the ornamental writers of the 16th and 17th centuries revived A facility in bringing up before the memory incessant analogous metaphors is the property, not merely of certain men, but of certain ages, it flourished in the age of Giovanni Marini and was welcomed again in that of George Meredith A vivid concrete style, full of colour and images, is not to be condemned because it is not an abstract style, scholastic and systematic. It is to be judged on its own ments and by its own laws. It may be good or bad, it is not bad merely because it is metaphorical and ornate The amazing errors which lie strewn along the shore of criticism bear witness to the lack of sympathy which has not perceived this axiom and has wrecked the credit of dogmatists. Yet that particular species of affectation which encourages untruth, affectation, parade for the mere purpose of producing an effect, must be wrong, even though Cicero be guilty of it

be wrong, even inougn Licero ne guilty of a See Walter Pater, An Evroy on Style (1889); Walter Raleigh, Style (1897). Fowlet, A Dictionary of Modern English Unage (1926)

For style in architecture, etc , see Periods of Art

STYLOBATE, in architecture, the upper step of a Greek temple on which the columns test, also applied to all three steps STYLOPS, the name of a genus of insects belonging to the order Strepsiptera allied to the beetles. The order is distributed over most parts of the world, but numbers less than 200 species. The males are minute, black or brown insects with branched antennae and vestigial mouth parts the forewings are reduced to clublike scales but the hind wings are large and fanlike. They are seldom seen and lead a very brief life. The females are mostly degenerate sachke parasites that live partly protruding from the bodies of bees, wasps or leafhoppers and other insects. The young larvae are minute and known as triungulins, which hatch within the parent and probably escape on to flowers, etc., where they await the presence of a host. On finding the latter they bore their way into the body, change into legless maggots and pupate there, in most species, the males alone subsequently emerge. The presence of these parasites frequently induces structural and other changes in their hosts including the acquisition of characters pertaining to the opposite sex (parasitic castration),

STYRENE, also known as vnyl benzene or phenyl ethylene is a hydrocrabon known to sedence from 1839 and occurring to a limited extent naturally in crude xylene and in storax balsam (onental sweet gum). Styrene produced synthetically was introduced commercially in the United States in 1937. It is now produced in greater quantities than any other synthetic aromatic hydrocarbon, the 1945 production being about 400,000,000 lb. The raw materials used for the production of styrene are ethylene derived from crude oil (or natural gas) and benzene obtained from coal. These products are combined to form ethyl benzene from which the styrene is obtained by catalytic dehydrogenation. The crude product is purified by distillation.

Styrene has the structure CoH5.CH.CH2. It is a water-white hauid having a molecular weight of 104 14, a specific gravity of 0.904+, a refractive index of 1.5439, a boiling point of 145.20 C, and a freezing point of -30.63°C. Styrene has a sweet, penetrating aromatic odour that makes it desirable for certain types of perfume Chemically its reactive double bond permits polymerization reactions (see POLYMERIZATION) which are utilized in the manufacture of plastics and of synthetic rubber. It is chemically reactive with halogens, hydrogen halides and many other compounds Polymerized styrene (polystyrene) is one of the major mexpensive thermoplastics. It is a rigid plastic having excellent electrical and optical properties, good water and chemical resistance and good mechanical strength. It can be produced in a wide range of colours. Styrene is a major ingredient of GR-S synthetic rubber. Along with butadiene it had to share the tremendous burden of the demand for synthetic rubber during World War II

STYRIA, a province of Austria, seized by Germany during the

tude, and the precise and classic mode of writing m another form are chilors of 1938, covering 6,716 sq ml, is distinguished for its came into voque (Joseph Addison, Jacques Bessuet, Giovania scenery and muneral wealth It is divided into Upper Styna, Voq. Samuel Johnson). In the right century admiration of the temperatures of the right and right centures revived A and Min-Mul, and Lower Styna, the region of the middle Mur affacility in bringing up before the memory incessant analogous and the headwaters of the Raab Upper Styna north of the Eans metaphors is the property, not merely of certain me, but of ter, tam ages, it flourished in the age of Giovanni Marini and was welter the property of the state of the st

Despite the mountainous character little of the soil is unpoductive, only 8% of the area long classed as harren land Forests cover 45% of at sproductive area, cultivated land 20% and the remainder is good grassland. In Upper Styra cultivation favours the fertile glacul moranes and alluvial fens of the stream terraces and haims, rye, oats and buckwheat being the most common cereals though wheat, barley and make are also grown. In addition potatoes, flax, hemp and ioot crops are important. Dow-Styria under more favourable conditions of soil and climate produces wine, fruit and hops. Calle bueding is a flourishing activity supported by the breeding of draught horses in the marshy basins, pigs and poulity thrive in Lower Styra while sheep are on the increase everywhere, large numbers of game of vanous kinds are also to be found on the highlands of

The Erzberg iron mines have been worked from the Roman period and yeld nearly the whole of the Austran production Signal supplies about 50% of Austran lignite production. In addition there are important deposits of magneste, e.g., at Trieben, while other mineral resources include graphite, aluminium, salt, marble and building stone The Tertiary basin of Lochen and Dinauki, near coal and iron supplies, is the centre of the iron and steel undusty, Graz (q v), the administrative, religious and intellectual capital, is also the commercial centre of the province. In the Styram Salckammegut around Aussee, near Giava at the spas of Gleichenberg and Tobelhad and in the Semmening district of Mutzauschlag, an increasing revenue is derived from tourists. Styria is richly endowed with water power, notably in the valleys of the Enns. Mur and Murz.

The population in 1939 was 1,120,146, equivalent to 167 persons per sq m1, but it is very unevenly distributed. In the more remote highland region of Upper Styria isolated houses or small villages are the rule, the inhabitants of villages and districts having often united in co-operative agricultural groups. Settlements in the valleys are small and strung like beads along the river courses They are markets for the neighbouring mountain valleys and often busy manufacturing centres, but apart from Graz few towns exceed 10,000 inhabitants. The population is mainly German in speech with Slovene intermixture in the southeast, and Roman Catholic in faith Despite a mountainous situation, the early fame of its metallic wealth attracted notice, from Roman times onward, and it has been traversed by most of the migratory peoples of whom the Slavs left the strongest imprint. Under Charlemagne it became part of the duchy of Carinthia, obtained separate existence as the mark of Styria in 1056, passed to the Habsburgs in the late 13th century and was annexed by Adolf Hitler in 1938

See also Austria and K Kochl, Steirisch Land und Leute (Graz, 1923); Otto Reicher, Die Steiermaik (Beilin, 1938).

STYX, a stream near Nonacris in Arcadia, Paus , viii, 17, 6 ff, where see Frazer's commentary, the modern Mavro Nero (Black Water). It was thought to be virulently poisonous and capable of dissolving any vessel it was put in, save one made from the hoof of a horse. From the time of Homer, Styx (The Hateful) is one of the rivers of the underworld, generally its boundary, and the gods, if they swear by it, dare not break their oath In Hesiod (Theogonia, 383 ff.) the nymph Styx, daughter of Ocean. with her children (Power, Might, Victory and other abstractions) helps Zeus against the Titans, and is therefore honoured by him. If a god does break the oath, he is insensible for a year and then banished for nine years; mortals on occasion might take this oath, and in either case it would seem to have involved dinking the water (Hestod, op. cit., 783 ff.; Herodotus, vi, 74) We may suppose that the oath was really an ordeal; the water was a magical poison, perhaps originally fatal only to perjurers.

SUAKIN, a seaport of the Anglo-Egyptian Sudan on the Red sea. It is a coraline islet connected with the suburb of El-Kef on the mainland by a causeway and a viaduct. Access is gained to the harbour by a winding and dangerous passage more than 2 mi, long, terminating in a deep oval-shaped basin several acres in extent, and completely sheltered from all winds. Suakin is superseded by Port Sudan (qv), a harbout 36 mt to the north At Suakin, as at Massawa, traders were attracted by an island site which protected them from the Arabs The mainland belonged in the middle ages to the Beja (q v ), but in 1330 Ibn Batuta found a son of the amir of Mecca reigning in Suakin over the Beja, who were his mother's kin. Makrızi says that the chief inhabitants were nominal Moslems and were called Hadarib The amir of the Hadaub was still sovereign of the mainland at the time of J. L. Burckhardt's visit (1814), though the island had been seized in 1517 by the Turks under Selim the Great. Mohammed Ali after the conquest of the Sudan leased Suakin from Turkey. This lease lapsed with the pasha's death, but in 1865 Ismail Pasha 1eacquired the post for Egypt It has always been the place of embarkation for Sudan pilgrims to Mecca Legitimate commerce, rapidly growing before the revolt of the Mahdi (1881), was greatly crippled during the continuance of the dervish power, though the town itself never fell into their hands. The port is connected by railway with the Nile valley joining that route at Atbara 300 mi. west of Port Sudan.

SUARDI, BARTOLOMMEO (c. 1455-c. 1536), Italian painter and architect, frequently called Bramanton, was burn in Milan, the son of Alberta Suarch. He executed paintings containing portrats of celebrated personages for the Vatican. In 1508 he was engaged in Rome. Bramante d'Urbino taught him architecture, and had his assistance in the execution of the interior of the church of San Satiro, Milan. In 1525 Bramantino was appointed architect to the court by Duke Francis (II) Sforza

Bartolommeo Suardi has been confused with a certain Bramantino da Milano, of whom Vasari makes frequent mention. The Bramantino of Vasari, if he existed at all, worked for Pope Nicolas V between 1450 and 1455.

See A della Croce, Le Rovine di Roma (Milan, 1875) (from the sketch book of Suardi in the Ambrosiana Library at Milan).

SUAREZ, FRANCISCO (1548-1617), Spanish theologian and philosopher, was born at Granada on Jan 5, 1548, and educated at Salamanca. Influenced by the Jesuit John Ramirez he entered the Society of Jesus in 1564, and after teaching philosophy at Segovia, taught theology at Valladolid, at Alcala, at Salamanca and at Rome successively. After taking his doctorate at Evora, he was named by Philip II principal professor of theology at Coimbra. Suarez may be considered almost the last eminent representative of scholasticism. In philosophical doctrine he adhered to a moderate Thomism. On the question of universals he endeavoured to steer a middle course between the pantheistically inclined realism of Duns Scotus and the extreme nominalism of William of Occam. In theology, Suarez attached himself to the doctrine of Luis Molina, the celebrated Jesuit professor of Evora, and endeavoured to reconcile his view with the more orthodox doctrines of the efficacy of grace and special election. This mediatizing system was known by the name of "congruism."

Suiace is probably more important, however, as a philosophical jurist than as a theologian or metaphysical. In his extensive work Tractatus de legibus ac deo legislatore (reprinted, London, 1679) he is to some extent the precursor of Grotius and Samuel Putendorf. Grotius spakes of him in terms of high respect. Suarerefutes the divine right of kings—doctrines popular in England

and to some extent on the continent.

In 162, at the instigation of Pope Paul V, Suares wrote a treatise dedicated to the Christian princes of Europe, entitled Defensio catholicae fide centra anglicance sectae errores. This was directed against the each of allegiance which james! a trancied from his subjects. James caused it to be burned by the common hangman, and forbade its perusal under the severest penalties, complaining bitterly at the same time to Philip III that he should harbour in his dominions a declared enemy of the throne and majesty of kings. Suares lived a very humble and simple life.

He died after a few days' illness on Sept 25, 1617, at Lisbon
The collected works of Suarez have been printed at Maina and
Lyons (1630), at Venuc (1740-517), at Besançon (1856-63) and
in the collection of the Abbé Migne His life has been written
by Emile Deschamps (Vita Pr. Suaresis, Perpugan, 1671). The
helf modern authorities are K Wenner's Prina Suarez u dae
Scholastik der letten Jahrhunderte (Regensburg, 1861) and
Stockt's Geschichte der Philosophia des Mittellaters, in, 631 sea

SUBCONSCIOUS, in psychology, means anything that is neither in the focus nor in the margin of consciousness (that is, does not receive attention, and so cannot be recognized in the actual experience of the moment), but which nevertheless must be assumed to be influencing us in some way, as a disposition, etc See Abnormal Psychology, Psychology, Unconscious, with bibliographies

SUB-DOMINANT, in music, the 4th degree of the diatonic scale, as F in the scale of C. (See Harmony)

SUBIACO (anc Sublaqueum), a town of Italy, picturesquely situated on the Anio, 1,339 ft. above sea level. Pop (1951) 9,201 (commune). It was so called from its position under the three artificial lakes constructed in the gorge of the Anio in connection with the aqueduct of the Anio Novus, which had its intake at the lower end of the lowest of them (the Simbruina stagna of Tacitus) On the banks of this lake Nero constructed a villa, in the remains of which was found the beautiful headless statue of a youth kneeling, now in the Museo delle Terme at Rome The lakes ceased to exist, the last dam being washed away in 1305 In 494 St Benedict retired as a hermit to a cave (Sacro Speco) above the lakes of the Anio In 505, probably, he founded the first of his 12 monasteries The church dedicated to Ste. Scholastica, St Benedict's sister, was erected in 981 In 1053 it was restored and a campanile built, which still exists, and in the middle of the 13th century the church was rebuilt in the Gothic style Other buildings grew up round it. the closster on the right is a fine Romanesque arcaded court with twisted columns and Cosmatesque (13th cent ) mosaics, the south side by Lorenzo Cosmati, the other three sides by his sons (c 1227-1243) See BENEDICTINES.

Arnold Pannartz and Conrad Schweinheim, two German ecclesastics, set up here the first printing press in Italy, issuing an edition of Donatus (1464), followed by one of Cicero (1465) and of Lactantius (1465). Copies of the Lactantius, of the Augustine of 1467, printed not here but in Rome, and of other rare incunabula are preserved here. Still more interesting is the monastery of the Sacro Speco, higher up the hill. The Grotta des Pastori has frescoes of the 9th century, while the Sacro Speco, or cave of St Benedict, contains frescoes of the 13th, and so does the lower church, the latter having been in part repainted in the latter half of that century by an unknown master Conxolus The upper church contains scenes from the life of Christ by a Sienese master of the end of the 14th century, to whom is also attributable a remarkable fresco of the triumph of death and some 15th-century work, and in the chapel of St. Gregory a portrait of St. Francis of Assisi (who was perhaps here in 1218), probably painted before 1228, as it lacks the halo and the stigmata. The whole group of buildings is constructed against the rocky sides of the gorge, part of it on massive substructions

The town contains various buildings constructed by Pius VI, who as cardinal was commendatory abbot of Subiaco II is crowned by a mediaeval castle constructed originally by Gregory VII. (T. A)

SUBJECT: see TERM; JUDGMENT; LOGIC.

SUBJECTIVISM, a philosophical term, applied in general to all theories which hay stress on the purely mental sides of experience, opposed to objectivism. In the narrowest sense subjectivism goes to the logical extreme of denying that mind can know objects at all (cf. SOLTESIM, IDEALISM)

SUBLEYRAS, PIERRE (1699-1749), French painter, was born at Uzès (Gard) in 1699 He gained the grand prix and west to Italy in 1792. His first important work was "Christ's Visit to the House of Simon the Pharisee" (Louvre, engraved by Subleyras himself), ordered by the canons of Ast, which made his repu-

Cardinal Valenti Gonzaga next obtained for him the order for "Saint Basil and the Emperor Valens" (small study in Louvre), which was executed in mosaic for St. Peter's Benedict XIV and all the princes of Rome sat to him, and the pope himself commanded two great paintings-the "Marriage of St. Catherine" and the "Ecstasy of St Camilla"-which he placed in his private apartments. Subleyias shows greater individuality in his curious genre pictures, which he produced in considerable numbers (Louvre) In his illustrations of La Fontaine and Boccaccio his true relation to the modern era comes out; and his drawings from nature are often admirable (See one of a man draped in a heavy cloak in the British Museum ) He died in Rome on May 28, 1749 His wife was a celebrated miniature painter, Maria Felice Thibaldi

SUBLIMINAL SELF. The phrase owes its wide currency to the writings of F W H. Myers, especially to his posthumous work Human Personality and its survival of Bodily Death. In the stricter usage the phrase stands for an hypothesis which seemed to its author to bring almost all the strange facts he observed under one scheme of explanation. But the phrase "Subliminal Self" is now often used by those who do not fully accept Myers's hypothesis, as a convenient heading to which to refer all the facts of many different kinds that seem to imply subconscious or unconscious mental operations. It is the stricter sense that here concerns us

In the speculations of Schopenhauer and of Eduard von Hartmann, the "Unconscious" played a great part as a metaphysical punciple explanatory of the phenomena of the life and mind of both men and animals. But with these exceptions, the philosophers and psychologists of the 19th century showed themselves in the main reluctant to admit the propriety of any conception of unconscious or subconscious mental states or operations. The predominant tendency was to regard as the issue of "automatic" nervous action or of "unconscious cerebration" whatever bodily movements seemed to take place independently of the consciousness and volition of the subject, even if those movements seemed to be of an intelligent and purposeful character. This attitude towards the subconscious is still maintained by some of the more strictly orthodox scientists; but it is now very widely accepted that we must recognize in some sense the reality of subconsciousness or of subliminal pyschical process. The conception of a limen (threshold) of consciousness, separating subconscious or subliminal psychical process from supraliminal or conscious psychical process, figured prominently in the works of G. T. Fechner, the father of psycho-physics, and by him was made widely familiar. In the last half century, there has been accumulated a mass of observations which establish the reality of processes which express themselves in purposeful actions and which bear all the marks from which we are accustomed to infer conscious cognition and volition, but of which nevertheless the subject or normal personality has no personal knowledge.

Among the commonest and most striking of such manifestations is the "automatic writing" which a considerable proportion of normal persons are capable of producing. A person who has this power may sit absorbed in reading or in conversation, while his hand produces written words or sentences, of which he knows nothing until he afterwards reads them. In some cases the matter so written states facts previously known to the subject but which he is unable to recollect by any voluntary effort. And in rare cases the matter written seems to imply knowledge or capacities which the subject was not believed to possess either by himself or by his friends Other actions, including connected speech, may be produced in a similar fashion, and in the last case the subject hears and understands the words uttered from his own mouth in the same way only as those from the mouth of another person. "Tabletilting," "planchette-writing," and the various similar modes of spelling out by the aid of a code intelligible replies to questions, which have long been current in spiritistic circles and which, by those who practise them, are often regarded as the operations of disembodied intelligences, seem to belong to the same class of process. In extreme cases the manifestations of such subconscious or (better) co-conscious operations are so fre-

tation and procured his admission into the Academy of St. Luke. quent, exhibit so much continuity and express so clearly a train of thought, purpose and memory, that they compel us to infer an organized personality of which they are the expression; such are the cases of double or multiple consciousness or personality. Very similar manifestations of a "co-consciousness" may be produced in a considerable proportion of apparently normal persons by means of post-hypnotic suggestion; as when suggestions are made during hypnosis, which afterwards the subject carries out without being aware of the actions, or of the signals in response to which he acts, and without any awareness or remembrance of the nature of the suggestions made to him. The more sober-minded of the investigators of these phenomena have sought to display all such cases as instances of division of the normal personality, and as explicable by the principle of terebral dissociation (see HYPNO-11SM), the more adventurous, concentrating their attention on the more extreme instances, regard all such manifestations as instances of the possession and control (partial or complete) of the organism of one person by the spirit or soul of another, generally a deceased person. Myers's hypothesis of the subliminal self was a brilliant attempt to follow a middle way in the explanation of these strange cases, to reconcile the two kinds of explanation with one another, and at the same time to bring into line with these other alleged facts of perplexing character, especially veridical hallucinations (q v), various types of communication at a distance (see Telepathy), and all the more striking instances of the operation of suggestion and of hypnosis, including the exaltation of the powers of the senses, of the memory and of control over the organic processes.

Myers conceived the soul of man as capable of existing independently of the body in some super-terrestrial or extra-terrene realm He regarded our normal mental life as only a very partial expression of the capacities of the soul, so much only as can manifest itself through the human brain. He regarded the brain as still at a comparatively early stage of its evolution as an instrument through which the soul operates in the material world So much of the life of the soul as fails to find expression in our conscious and organic life through its interactions with this very inadequate material mechanism remains beneath the threshold of consciousness and is said to constitute the subliminal self. It is held to be in touch with a realm of psychical forces from which it is able to draw supplies of energy which it infuses into the organism, normally in limited quantities, but, in exceptionally favourable circumstances, in great floods, which for the time being raise the mental operations and the powers of the mind over the

body to an abnormally high level. Abnormal mental manifestations that have commonly been regarded as symptoms of mental or nervous disease or degeneration are by its aid brought into line with mental processes that are by common consent of an unusually high type, the intuitions of genius, the outbursts of inspired poesy, the emotional fervour or the ecstasy that carries the martyr trumphantly through the severest trials, the enthusiasm that enables the human organism to carry through incredible labours Myers's hypothesis thus boldly inverts the dominant view, which sees in all departures from the normal symptoms of weakness and degeneracy and which seeks to bring genius and ecstasy down to the level of madness and hysteria, the hypothesis of the subliminal self seeks to level up, rather than to level down and to display many departures from normal mental life as being of the same order as

the operations of genius. This bold and far-reaching hypothesis has not up to the present time been accepted by any considerable number of professional psychologists, though its author's great literary power has secured for him a respectful hearing.

10 n lm a respectful hearing.

SUBMARINE. The submarine first became a major factor in naval warfare during World War I, when Germany demonstrated its full potentialities However, its advent at that time, marked by wholesale sinkings of Allied shipping, was in reality the culimation of a long process of development

Ancient history includes occasional records of attempts at underwater operations in wai fare. The Athenians are said to have under objective to clear the entrance to the harbour of Syracuse during the sage of that city. In his operations against Tyre, Alexander the Great ordered divers to impede or destroy any submarine defenses the city might undertake to build. But in none of these records there a direct reference to the use of submersible apparatus of any kind. There is, howeve, a legend that Alexander the Great himself made a descent into the sea in a device which kept its occumants dry and admitted light.

Not until 1580 does any record appear of a craft designed to be navigated under water. In that year William Bourne, a British naval officer, made designs of a completely enclosed boat which could be submerged and rowed under the surface. It consisted of to be submerged by reducing its volume by contracting the sides through the use of hand vises Although Bourne never built this boat, a similar construction, sponsored by one Magnus Pegelius, was launched in 1605 But the designers made one serious oversight. They failed to consider the tenacity of underwater mud and the craft was buried at the bottom of a river during initial underwater trials. It is to Cornelius van Drebel, a Dutch physician, that credit is usually given for building the first submarine To him is conceded the honour of successfully manoeuvring his craft during repeated trials in the Thames river, at depths of 12 to 15 ft beneath the surface

Van Drebel's craft resembled those of Bourne and Pegelius in that its outer bull consisted of greased leather over a wooden framework. Oars, extending through the sides and sealed with thigh-fitting leather flaps, provided propulsion either on the surface or when submerged. Van Drebel built his first boat in 1620 and followed it later with two others, both larger but emboding the same principles. It is reported that after repeated tests, James I took a trup in one of the larger models and demonstrated its safety. But despite this evidence of royal favour, the craft failed to arouse the interest of the navy in an age when all conception of the possibilities of submanne warrare was still far in the

Submarine boats seem to have been numerous in the early years of the 18th century. By 1727 no fewer than 14 types had been patented in England alone An unidentified inventor, whose work is described in the Gentleman's Magazine of 1747, introduced an ingenious method of submerging and surfacing his submarine. His craft was to have had a number of goatskins built into the hull. each of which was to be connected to an aperture in the bottom He planned to submerge the vessel by filling the skins with water and to bring it to the surface again by forcing the water out of the skins with a "twisting rod." This was the first approach to the modern ballast tank. By that time, ideas were plentiful, some of them fanciful and grotesque but some containing certain practical elements. Lack of full understanding of the physical and mechanical principles involved, coupled with the universal conviction that underwater navigation was impossible and of no practical value, postponed for more than another hundred years the attempt to include a submarine in naval warfare.

In the American Revolutionary War, a submarine was first used as an offensive weapon in naval warfare. The "Turtle," a one-man submersible invented by David Bushnell and hand-operated by a screw propeller, attempted to sink a British man-of-war in New York harbour. The plain was to attach a charge of gunpowder to the ships bottom with a screw and explode it with a tume fuse. After repeated failures to force the screws through the copper sheathing on the hull of H.M.S. "Eagle," the submarine gave up, released the charge and withdrew. The powder exploded without result, except that the "Eagle" at once decided to shift to a berth fatther out to see

Although his name is most often associated with the invention

of the steamboat, Robert Fulton experimented with submarine at least a decade before he sailed the "Clermont" up the Hudson Fulton's "Nauthus" was built of steel, in the shape of an elongated oval It was somewhat smillar in structure to the modern submarine. A sail was employed for surface propulsion and a hand-driven screw propeller drove the boat when submerged A modified form of coming tower was equipped with a porthole for underwater observation since the persocope had not yet been invented. In 1801 Fulton tried to interest France, Britain and the US in his idea, but no nation ventured to spossor the development of the caft, even though his model was superior to any submarine designed up to that time

Development of the submarine boat was held back during all of this period by lack of any adequate means of propulsion Nevertheless, inventors continued resolutely with experiments upon small, hand-propelled submersibles, carrying a ciew of not more than six or eight men On Feb 17, 1864, a Confederate vessel of this type, the "Hunley," sank the "Housatonic," a Federal corvette that was blockading Charleston harbour. This is the first recorded instance of a submarine sinking a warship The "Hunley" accomplished the feat by using a torpedo suspended ahead of her how as she rammed the corvette Interest in improvement of the submaine was active during the period of the American Civil War, but the problem of a suitable means of propulsion continued to limit progress. Steam was tried and finally in 1880 an English clergyman, Garrett, successfully operated a submarine with steam from a coal-fired hoiler which featured a retractable smokestack. During the same period, a Swedish gun designer, Nordenfelt, also constructed a submarine using steam and driven by twin screws His ciaft, which could submerge to a depth of 50 ft, was fitted with one of the first practical tornedo tubes

Meanwhile, electric propulsion machinery had proved its utility in many fields In 1886 an all-electric submarine was built by two Englishmen, Campbell and Ash Their boat was propelled at a surface speed of six Roits by two 50-bp electric motors operated from a roo-cell storage battery. However, this craft suffered one major handricap—its batteries had to be recharged and overhauled at such short intervals that its effective range never exceeded 86 mit.

Antedating the efforts of Nordenfelt were the experiments of J. P. Holland of New Jersey, who launched his first boat in 1875. Although his early models embodied features that were discontinued as development progressed, many of his initial idea, perfected in practice, came into later use. Outstanding in importance was the principle of submergence by water ballast and the use of horizontal rudders to dive the boat

Not until 1895, however, did Holland, in competition with Nor-denfelt, finally receive an order for a submarine from the United States government. The vessel, named the "Plunger," was propiled by steam on the surface and by electricity when submerged. The original craft was redesigned frequently during construction and was finally abandoned altogether in favour of a newer model then building in the Holland shippard. This was Holland's ninth submersible, but it was the first to be delivered to the U.S. government. It was delivered in 1900 and was the basic design of all submarines to follow.

Simon Lake, who began building submarines in 1894, designed them primarily with peacetume uses in mind. His vessels could travel about the sea bottom and had an air lock which permitted a passenger in a diving helmet to emerge from the hull to walk about and explore In fact, Lake used his extensively in commercial salvaging operations. His first model, the "Argonaut, Jr." was solely an experimental one. It was built of two layers of yellow pine with a sheet of canvas between them and was operated by band

It was followed in 1807 by the "Argonaut," a cigar-shaped hull of ft long and powered by a 30-h p, gasoline engine This craft could submerge to the bottom of a lake or river and roll along the bottom on three wheels. For navigating, the wheels could be raised and carried in packets in the keel. In 1898 the "Argonaut" travelled under its own power through heavy November storms from Norfolk to New York and was thus the first submarine to

navgate extensively in the open sea. In 1006 Lake built the "Protector" and sold it to Russa. After it had successfully passed various severe tests there, Lake built a number of submerables on contract for the Russang sovenment. Thus, the fundamental principles of construction and operation of submarine boats had been determined and demonstrated before the outbreak of World War I. By that time, too, internal-combustion engines, both gasoline and diesel, were available for use as practical power plants. The invention of the peiscope had maternally increased the feasibility of underwater navigation. And the primary weepon of the publication of the peiscope had maternally increased the feasibility of the desired for use. Thus, the publication of t

Construction.—When the submarine rests on the surface, so thit of it is seen above the water that it has the appearance of being longer and more slender than it really is Actually, the modern fleet-type submarine is approximately 1:2 ft long with a superstructure deck tapering almost to a point, both fore and aft, from its greatest width of approximately is ft amidship

The personnel aboard the fleet-type submarme ranges in number from 66 to 76 Officers number from 6 to 8 and men from 60 to 70 Beneath the superstructure deck as the all-welded hull (actually two hulls). To understand the construction of a submarine, the conditions under which the vessel operates below the surface must first be appreciated. The submarine must at all times be water-tight, otherwise, self-destruction would deault. Construction as therefore on the basis of the fabrication of a series of watertight containers into one large watertight cylinder by means of water-tight points. The containers must be pressure vessels, that is, watering. The pressure vessels, being subject to mechanical actions (leverage), must be secured to each other by one common strength member (the keel) as well as by watertight connections foulkheads).

In the double-hull type of submarine, the pressure hull is haside the outer hull; between the two hulls are the water and the fuel oil tanks. On US submarines the double-hull construction extends from the after bulkhead of the forward torpedo room to the forward bulkhead of the after torpedo room. The pressure or mner hull extends from the forward bulkhead of the forward turn tank to the after bulkhead of the after trum tank. Above the hull is buult a nonwatertight superstructure which forms the main deck, for use when surfaced

The topside nonwatertight superstructure deck extends the length of the ship The space between this deck and the pressure hull is used as locker space for stowing anchor gear, lines and other equipment that is not damaged by immersion in water Ready ammunition in watertight boxes easily accessible to gun crews is also kept in the superstructure. The ship's small boat is stowed in the superstructure on special cradles. The deck is perforated on either side with circular holes along the entire length to prevent air pockets from forming within the superstructure when it becomes flooded. A watertight tower, known as the conning tower, extends upward through the superstructure amidships. The top of the conning tower is used as a bridge when on the surface, but when submerged the control of the boat is maintained either from the conning tower or from a compartment directly below it known as the control room. Periscopes operated from the conning tower extend above the bridge and are used for making observations when submerged

The modern feet-type submarine is built to withstand the pressure of a head of sea water, consistent with requirements as pressure by battle experience and with naval specifications. The pressure is measured in actual submergence tests from the surface of the water to the axis of the vessel through its pressure hull.

Individual compartments are air tested for tightness only, to a pressure of 15 lb per square inch Wateright bulkheads are designed structurally and strengthened through reinforcements to withstand the pressure at the previously mentioned test depths.

The total pressure that the hull must withstand is actually the

navigate extensively in the open sea. In 1906 Lake built the differential piessure between the interior hull pressure and the "Protector" and sold it to Russia. After it had successfully passed external head of water at a given depth

Armaments.—To pedo tubes are the main oftensive and deiensive aimament of the submarine. A total of ten 2x-in tubes is usually carried, six forward and four aft. The tubes can be fired electrically or by hand when surfaced or submerged. The condition of the tube is indicated by the topredo ready lightly

The 5-IN 25-cal deck gun is a dual-purpose gun. It is so mounted as to be used effectively against surface craft and arcraft. Two guns may be carried, if one gun is carried it is located abact of the conning tower. However, this is used only in emergency or when the taget is not considered worthy of expending a torpedo. Light anti-aircraft guns (40 mm and 20 mm) are mounted forward and aft of the conning tower. They are principally anti-aircraft weapons, but may be used against surface craft. In addition to the armament described above, the fleet-type submarine carries other small arms and pyrotechnics. Chief among these are machine guns and submachine guns. During World War II submarines also carried mines which could be discharged from the torredo tubes.

The submanne is essentially a torpedo vessel, launching its torpedoes while submerged or surfaced. The size of its torpedo and the number of tubes gradually increased, until by mid-soft century the 11-in. torpedo was being launched from 6 torpedo tubes forward and 4 aft, the submarine carrying 24 torpedoes. The tubes are horizontal fore and aft and can be loaded from within the submarine The tube is fitted with doors at either end so that the inner door can be opened when the outer door is closed and vice versa. The torpedoes are dischaged by air pressure either by remote control from the conning tower or at the tubes by operating personnel.

Subdivision.—A modern submarine contains, in addition to the mechanisms required to operate it on the surface, a multitude not operating machinery and tanks which enable it to drive, surface and proceed submerged. Although it so not of the most compared to the most compared to the submarine and proceed submerged. Although its one of the most compared vessels afloat, it is designed and arranged along simple and logical lines, and in spite of the seeming confusion of valves, lines and apparatus, everything in the submarine is situated to ensure the maximum of speed and efficient such as the submarine is situated to ensure the maximum of speed and efficient speed and efficient such as the submarine is situated to ensure the maximum of speed and efficient speed speed efficient speed and efficient speed speed and efficient speed speed speed and efficient speed efficient speed sp

The modern fleet-type submatrne consists of a superstructure and a hull surrounded for the most part by varrous fuel and water ballast tanks The pressure hull, designed to withstand the sea pressure, houses most of the ship's machinery and provides the living quarters for the officers and the crew. It is divided into eight watertight compartments, separated by pressure builkheads provided with waterlight pressure-ressing doors. The minth compartment, the coming tower, in the shape of a cylinder placed on its side, is located above the control room and connects with the control room through the access hatch

The compartments in turn are divided by means of the platform deck into upper and lower sections which contain the spaces housing the vanous equipment and providing the necessary facilities for the submarine's officers and crew.

Exterior.—The exterior view of the submarine presents a very low silhouette, primarily because the vessel is designed to have a low positive buoyancy to permit quick submergence and normally is two-thirds submerged as it rides on the surface

The extenor hull has a cylindrical shape which gradually tapers of from the middle both forward and sit, giving a cigar-shaped appearance. The superstructure deck, called the main deck, excels virtually from the tip of the bow to near the stern. The deck is generally level. Beginning about the midship section it rises gradually in the direction of the bow to a height of approximately 12 ft. above the water line. The freeboard of the after end of the man deck is about four feet.

The main deck is attached to the exterior hull by means of the framing and rounded sides. Limber holes in the sides allow sea water to enter all hollow spares in the superstructure and the deck when diving, and drain off when the submarine is surfacing. The midship section of the main deck is occupied by the conning tower, which is surmounted by the bridge deck, with perscope shears, periscope, radio compass loon and madra gear.

The after section of the bridge deck contains the ship's pelorus, one anti-aircraft gun and ammunition ready lockers. The forward part of the bridge is similarly equipped with anti-aircraft guns and ammunition lockers

The forward section of the main deck houses the capstan, marker buoy, forward escape and rescue hatch, cleats, hydrophone, forward torpedo loading hatch and radio antenna The after section of the deck contains the 5-in 25-cal gun, galley access hatch, after engine 100m access hatch, after torpedo loading hatch, and escape hatch, marker buoy and capstan

The bow is equipped with six torpedo tube shutters, three on the port and three on the starboard side, and also the bow diving planes. The underside of the hull contains ballast tanks, flooding ports and underwater sound heads

The after end of the ship on the underside is equipped with the four stern torpedo tubes two to a side, port and starboard screws, the diving planes and the rudder

Tanks.-In a submarine, the principal ballast is water. Therefore, the arrangement of the tanks built into the ship establishes the points at which water ballast may be concentrated It is the arrangement of these tanks that makes possible controlled diving and surfacing and the maintenance of diving trim at any depth The arrangement of the tanks with respect to the centre of buoyancy establishes the lever arm for maintaining fore-and-aft balance and athwartship stability.

The water ballast tank groups consist of four groups, which are further subdivided into ten tanks. There are three fuel ballast tanks divided into A and B sections which are connected through limber holes in the vertical keel plating. The fuel ballast tanks normally carry fuel oil. When not being used as fuel ballast tanks

they may be used as main ballast tanks

In addition to the above-named water ballast tanks, there are the normal fuel oil tanks, collecting tank, expansion tank, clean fuel oil tank, main sump tanks, reduction gear sump tanks, freshwater tanks, emergency fresh-water tanks, battery fresh-water tanks and sanitary tanks The main ballast tanks are water ballast tanks They are designated as main ballast tanks because they account for the greater percentage of the water ballast normally carried. They have as their primary function the destroying or

restoring of positive buoyancy The main ballast tanks are located between the pressure and outer hull and are separated by light athwartship bulkheads. These tanks are provided with flood openings located at the lowest point

possible on the outer hull.

All main ballast tanks have hydraulically operated vent valves. Sea water is admitted to each ballast tank through flood ports, located in the bottom of the tank near the keel. Air is vented out of the tank as the water is admitted through the vent valves located on top of the tank To force water out of the tank when it is desired to surface the submarine, high-pressure air is admitted into the tank, forcing the water back out of the flood valves

For correcting any alteration in the longitudinal distribution of weight, a "trim tank" is fitted at either end of the submarine. They are partially filled in the normal diving condition and connected by a pipe through which water is forced from one to the

other as required.

"Water around torpedo" tanks are fitted below the centre of length of the torpedo tubes and contain sufficient water to fill the spaces around the torpedoes when in the tubes. By their use the torpedoes can be left dry in the tubes and withdrawn for examination. If it is desired to fire a torpedo the tube is closed, the water from around the torpedo tanks is blown into the tube and when the door of the tube is opened no water enters and the weight of the submarine is unaltered. It is necessary to keep a constant check of variations in weight on the submarine to maintain a good "diving trim" at all times.

The fuel oil is the main item for which compensation is needed. The fuel is stored in the normal fuel oil tanks or in the fuel ballast tanks. The fuel tanks are completely filled with oil and are positioned symmetrically transversely and longitudinally. When fuel from a tank is required it is forced to the clean fuel oil tanks and thence to the engines by pumping sea water into the bottom of the tank. The oil passes out through a line at the top of the tank

Air Systems .- The importance of the air systems to a submarine cannot be overemphasized, for virtually every function in the diving and surfacing procedure stems initially from air provided by one or more of the air systems. The main hydraulic system, for example, operates because of the air pressure maintained in the air-accumulator flask, toipedoes are discharged by air; and the main propulsion engines are started by air Air or, more specifically, compressed air, is necessary to surface, submerge, attack and cruise Compressed air together with oxygen is used to revitalize the air in the ship after long periods of submergence Pressure in the boat, a test for tightness, utilizes air,

Compressed air is stored in banks consisting of seven or more flasks with a total capacity of 560 cu ft at 3,000 lb per square inch. It is supplied by two high-pressure air compressors located in the pump room, a cellarlike compartment located directly beneath the control room. Compressed air can be obtained also

from a tender ship from outside connections.

Trim and Drain Systems .- A submarine is designed to dive or surface rapidly under complete control, it must be able to proceed on the surface and to submerge at the desired rate of speed to the depths required. To do so quickly and efficiently, it must maintain fore-and-aft balance and athwartship stability. The chief function of the trim and drain systems is to maintain this fore-and-aft balance by controlling the amount and distribution of water in the various tanks used for this purpose Two motordriven pumps are provided for pumping out the submarine's tanks or bilges, they are capable of pumping against any depth pressure at which the vessel is designed to operate Both deliver or discharge overboard or from one tank to another, as desired They are also capable of pumping certain ballast tanks in case of compressed-air failure

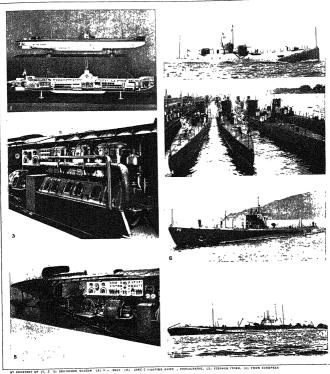

The rudder of the submarine is similar to that of any surface vessel. Under normal operation the steering system has its own source of electrohydraulic power The principal control units are assembled in the steering stand, located in the control room, However, since there is a steering wheel in the conning tower, to allow for every contingency the steering system is so planned that three different methods of steering are available, based on three different sources of hydraulic power-normally used power, hand and emergency. The rudder itself is moved by hydraulic power in all three cases, the only difference between these methods is

in the manner in which the power is developed

Bow and Stern Planes.-The hydroplanes or bow and stern planes, which are actually horizontal rudders, are used for depth and angle control of the submarine when operating submerged They are rectangular in shape and can be turned through 35° sither way. They also are controlled electrohydraulically The after pair when in a neutral position give the submarine a certain stability. The forward pair can be folded into the side of the superstructure which is called the housing. This decreases water resistance and the planes are not subject to additional strain when on the surface The bow planes also assist in submerging the vessel as they overcome the slight amount of buoyancy carried by the submarine, present even in a submerged condition. Hydraulic power is used to tilt the bow and stern planes. Each system (bow and stern planes) has its own power supply system. The control units for diving and rising are assembled in a diving control stand located in the control room. There is a set of controls for stern plane tilting, a set for bow plane tilting and control valves for bow plane rigging. The control panel has diving indicator gauges and motor switches. The planes are operated by enlisted crew members

Periscopes .- The periscope is the eye of the submarine It was invented and developed solely for the purpose of providing a means to view the surface without detection by surface craft While it is primarily simple in principle, actually it is a complicated piece of apparatus. It is probable that all navies of the world have similar instruments with only minor variations

The earliest submarines were built without provision for periscopes and when submerged were forced to grope their way blindly. In 1854 E. M. Marié-Davy, a Frenchman, designed a submarine

# INTERIOR AND EXTERIOR VIEWS OF VARIOUS TYPES OF SUBMARINES AND SUBMARINE MODELS

- 1 Exterior view and longitudinal section of the U-1, the first German U-boat Displacement on surface, 240 tons. Armament one bow torpedo tube; carrying capacity, three torpedos Exped on surface, 11 knots, submerged, 9 knots Built at the Germania Works, Kiel,
- in 1906
- in 1906
  IM S. "Y!" Displacement on surface, 2.525 loss, submerged, 3,600 tons. Armanest four Scin and Scin are typed tube. Seed 5. March 1906
  S. Munich Museum model of the U-1, showing that portion of the engine room containing the 450-hp. patroleum motors used to drive the twin screw which propil the submarine on the surface.
- 4 Fleet of Nazi submarines at home port. The three at the left in the
- first row are occangoing (740 tons, six 21 in torpedo tubes, speed 18% knots) U-45, right, is seagoing (517 tons)
- Munich Museum model of the U-1, showing the aft section of the sub-marine and the electric drive, including one of the 200-h p motors used for propulsion
- USS "Pompano" of the Perch class, launched in 1937 Displacement, 1,330 tons on surface Armament one 3-in, gun and six 21-in, tornedo tubes
- 7. Japanese first class submarine "155" Displacement on surface, 1,650 tons, submerged, 2,100 tons Armament one 4,7-in gun and sight torsed tubes Speed on surface, 21 knots; submerged, 7-9 knots Guilt in 1927

sight tube containing two mirrors, one above the other, held at a 45° angle and facing in opposite directions. These, while providing some degree of sight to the submerged vessel, were faulty at best, and in 1872 pisms were substituted for mirrors.

A U S naval man, Thomas H. Doughty, was the inventor of the original modern periscope, during the American Civil War

The essential function of a perscope is to give the person coming for the submanne a view of the surrounding horizon while his vessel remains submerged. The perscope must be long enough to extend beyond the surface and must deflect the horizontal rays of light first in a downward direction and then horizontally to the eye of the observer. In addition, the past above water must be as inconspicuous and streamlined as possible, in the form of a long narrow that The instrument used on U.S. submannes is of 40-f1 nominal length and 7½-m outer diameter. It is equipped with a tilting head prism capable of elevating the line of sight 74,5% above the horizon and of correcting for the roll or patch of the vessel.

Propulsion Engines.—The first U S submarines utilizing internal-combustion engines for propulsion were powered by 45-hp, two-cylinder, four-stroke cycle gasoline engines produced by the Otto company of Philadelphia, Pa Meanwhile, early British submarines made use of 12-and 16-cylinder gasoline engines.

The inherent hazards accompanying the use of such a highly volatile fuel as gasoline were quickly realized Stowage was a constant problem and handling of the fuel was extremely dangerous Internal explosions were frequent; many of the engines off considerable carbon monoxide fumes creating a menace to personnel.

In the meantime, M.A. N. (Maschinenfabrik Augsberg-Numberg A.-G.) of Germany built and experimented with two-stroke cycle diesel engines for submarine propulsion. However, insufficient progress had been made in metallurgy to provide metals capable of withstanding the greater heat and stress inherent in diesels M.A.N. then turned its efforts toward production of a four-stroke cycle diesel engine capable of developing 1,000 hp. While Inity successful, these engines eventually developed structural west-nesses at the craikcase. Pror to 1920 the engines used in most submarines of all the larger may powers with the exception of Green Britain were foundationed to the exception of Green Britain were foundationed to the complete of t

The need for more powerful engines became apparent with the development of the fleet-type submarne Eventually a 16-cylinder single-acting engine was developed as well as a 9-cylinder double-acting engine. The fact that submarines are both subsurface and surface vessels places definite restrictions upon size, buil design and shape. Total weight is also a factor having considerable bearing on underwater operations. In the first engine-powered submarines the engines were mechanically connected directly to the propeller shafting. However, after testing various types and designs, it became apparent that the disease-lecture drive was the best In this type, the engines were connected only to the generators, which in turn supplied power to the main motors driving the propeller shafting. The generators were also used to charge the storage batteries.

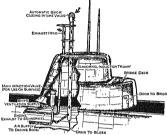

The modern fleet-type submarine is usually driven by four main propulsion diesel enganes, each capable of producing 1,600 h.p. The four main generators each produce 1,100 kw. There are four solv-speed motors, driven by the generators or batteries, each producing about 1,375 h.p. The auxiliary engine us rated at 450 h.p. and drives a 300-kw, senerator.

Batteries.—When submerged the diesels and generators are not used, and power for the motors is supplied by two sets of storage batteries, which are charged by the auxiliary and main generators during surface operations.

Each submarine has two main storage batteries consisting of two groups of 126 cells each. The forward battery is installed below decks in the wardroom country; the after battery is located in the crew's space. Each cell weighs approximately 1,650 lb. Each batters is fitted with an exhaust ventilating system to remove battery gases. The air required to operate this system is supplied through inlets located at opposite ends of each battery well. The free ain in the compartment is drawn through the filling vent connection of each cell. This is necessary in order to eliminate battery

gases and hydrogen which develops when recharging the batterns.

The "Schnorkel" and "Guppy."—In the latter part of World
War II the Germans adopted a radical change in submarine design
known as the "schnorkel"—a Dutch invention The spelling was
reduced by the Americans to "snorkel" and further abbreviated
by the British to "snort." Development of improved sonar (underwaters ound-detecting and ranging equipment) and radar, used by
both aeroplanes and surface craft against axis submarines, forced
the Germans to develop the new device.

SCHEMATIC DRAWING OF THE SCHNORKEL WITH RETRACTABLE PERISCOPES AND MAST SHOWN HERE IN UP POSITION

The schnorkel is a breathing tube which is raised while the submarine is at penscope depth. With the schnorkel in raised position, air for the disesis can be obtained from the surface. This considerably reduces the visible portion of the submarine and also electrical consumption, since the submarine can cruise almost totally submerged on its engines and conserve its battery power for attack and evasive manoeuvres

At the end of World War II the United States navy developed an improved schnorkel and also the upply submarine. The guppy ("greater underwater piopulson power") had the same type hull as that used for the fiele-type submarine of World War II fame. It was 36 ft. long and displaced about 1,800 tons. The only change in the bull was in the superstructure, which was radically changed by reducing the surface area and streamlining every protruding object. The life lines and all guns were removed, the bitts made retractable and the persone shears (supports) enclosed in a streamlined metal fairing. All topside equipment and armament were either removed, made retractable or streamlined. The speed of the new guppy was considerably greater than that of the feet-type boat, and nearly twice that of the old-type sought some process.

Developments After World War II.—The lessons of Nordo War II wrought great changes in submanne construction. Topedoes came to be fired by hydraulic (water) pressure matead of compressed air as previously, eliminating any chance of tellar eliar bubbles escaping to the surface and betraying the submanine's presence.

Hulls were given greater strength for deeper diving that enabled the submarine to pierce depths far below those previously possible Hydraulic mechanisms (oil) were employed extensively throughout the ship for quiet, efficient operation. Radar and sonar coujument increased in efficiency. Torpedoes no longer had to be fired with sharpshooting accuracy; fore-control equipment and homing torpedoes (the torpedo that

seeks its target) eliminated much of the guesswork and chance in firing torpedoes Engines, electrical motors and generators were made more compact

Atomic power became a practical reality to be used for the first time in a submainine projulison plant. Nuclear power was specified to generate steam within the hull of the US submarine "Nautius" as a result of a contract awarded to Westinghouse Electric corporation; and also to generate steam within the hull of the US submarine "Seawolf" as a result of a contract awarded to General Electric corporation. The keel of the "Nautilius" was laid at Groton, Com., in June 1925

Although nuclear power was a radical change in a source of energy, its application to ships was conventional in that steam and turbines had been used in ships, but unconventional in that; it was the first time that US submarines had used steam since the very first unsuccessful submarine, and in that this was the first turbine installation in a US submarine. Steam was to be generated and used to drive steam-turbine generators which in turn duve the propulsion motors and shaft to which the screws are fixed Themeans of propulsion along with greater speed would also give the submarine an advantage of almost unlimited crusing range, a limit probably restricted only by the endurance of the crew and the food the ship can store (H.S.DV.)

SUBMARINE CAMPAIGNS (WORLD WARS I AND II). At the outbreak of World War I in 1914, many people doubted whether the submarine was a senous menace to surface ships, but their confidence was rudely shaken when the British crusers ("Cressy," "Guget" and "Sullej" were torpedoed by the German "U 9" off the Belgan coast with a loss of 1,200 lives It was then clear that the submarine was going to prove a very senous factor in naval warfare and, furthermore, that many British harbons law well within their rudius of action

Boom defenses for Brutsh harbours were practically nonexistent, even in the case of Scapa Flow, the recognized war base for the grand fleet in the Orkney Isles A false alarm of an enemy submanne in the Flow on Sept 1, 1914, caused this anchorage to be abandoned by the fleet in favour of Loch Ewe on the west coast of Scotland, until submanne defenses could be hurriedly placed there

British submarnes were employed patrolling off the Heligoland bight and narrow waters round the coast on the lookout for enemy men-of-war, and U-boats were soon busy attacking the troop transports going to France To meet this attack the Dover patrol was organized, consisting of destroyers and small craft backed up with extensive mine fields

The range and efficiency of the submarine increased rapidly and British boats were employed effectively in waters such as the Baltic and Marmora, which were demed to British and Allied shipping by rifine fields. By June 19; U-boats had entered the Mediterranean and, working from Austran Adriatic ports, became a sention smeace to the Dardanelles and Salonika expeditionary forces.

Up to the end of 1914, the U-boat, though achieving considerable success, was having but little effect on the naval situation, but the sinking of six merchant ships on Jan. 30, 1915, gave an indication of what was to come. On Feb. 2, in regly to the British declaration of blockade of the enemy coasts, Germany published a notice warning all penetral shipping against approaching the coasts of Britain, followed by the celebrated memorandum of Feb 4 pro-diming that after Feb. 18 the waters around Great Britain would claiming that after Feb. 18 the waters around Great Britain would found there would be sunk without regard to safely of passengers or crew and that even neutral shaps would be in danger. The United States pointed out the illegality of this but the protest was directagated.

Antiubmatine Measures.—In Great Britain the state insurance scheme prevented panic and the order in council of March 11,
lonova as the Retalatory order, was issued. Merchant ships were
advised as to what precautions to take, the best procedure to
adopt when attacked and as to the use of wireless telegraphy.
Mine fields were laid to protect shipping routes in the North sea,
the auxiliary patrol was strengthened and various navigational
measures were adopted. In spite of all precautions losses com-

tinued and the range of attack increased, but there was hittle diminution in the flow of trade. Many victuris were claimed by the German mine-laying submarines, which laid their mines close to light vessels and buosy, these mines claimed victimes of all nationalities on the British east and south coast routes. After April to the bugger U-boats operated only in the North's and western approaches, where Scandinavian shipping suffered most severely

The sinking of the passenger ships "Palaba" and "Lustania" in May 1915 with heavy loss of life caused widespread indignation, and following US protests the German government gave orders that large passenger ships were to be spared A further US protest on the occasion of the sinking of the White Star line "Arabic" called forth fresh orders from Germany, and September saw the end of the first campaign in British waters

The 1916 Campaign .- During the winter of 1915-16 the U-boat fleet was increased and Germany decided to sink defensively armed merchant ships without warning, though passenger ships were still to be spared The sinking of the "Sussex," clowded with passengers for Dieppe, F1 , brought further strong protests from the U S president and again Germany gave way However, the Allied blockade bore so heavily on U S commercial interests that feeling against England grew bitter and tension between the U.S. and Germany diminished Encouraged by this, Germany decided to renew its war on commerce, and Scandinavian shipping especially suffered severely The rate of sinkings rose so fast that Adm Sir John (later Earl) Jellicoe took the unusual step of writing to the prime minister directly, calling his attention to the fact that the loss of shipping alone might soon force the Allies to conclude peace He was in consequence appointed first sea lord so that he could devote himself to finding the answer to this problem Tension between the US and Germany again increased because of the depredations of a U-boat off Nantucket During Dec 1916, 167 Allied and neutral ships were sunk and in Jan. 1017 the loss rose to 180 This favourable result led Germany to resume unrestricted wartare, and on Feb 1, 1017, it declared the areas enclosing Britain, France and the Mediterranean to be war zones, adding later the Portuguese Atlantic isles and Archangel Vessels of any nationality or character found in the war zones were to be destroyed without consideration for the lives of those on board

Losses increased rapidly and it appeared that the U-boats would win the war. They were being built faster than they were being destroyed and it was clear that the existing methods of dealing with them were inadequate On Apin! 70, he worst day of the worst month for Great Britain, 12 merchantimen and 8 fishing vessels were sunk One out of every four vessels that left the British Isles that month never returned, but in Apin! 1917 the unstricted war on commerce brought the United States into the struggle and by the end of the year that nation had sent 37 destroyers to assist the Allies

Convoy System.—Some new form of defense was obvously necessary, and the convoy system which had been used in the old French wars was resorted to in spite of strenuous opposition from many quanters because of the great difficulties and inconveniences entailed. It was first employed on the short voyages to France, then for those to Scandinavia, and such was its success that the system was introduced on other routes as soon as secort craft became available. By November the losses were reduced to less than half what they had been in May, and as the losses in shipping decreased the destruction of U-boats increased Scientists and inventors were also at work and the first success with the hydrophone had been obtained on April 23, 1916, when the trawler "Cherio" located the U.C.3 with a hydrophone and beath thanks.

As 1917 progressed, it became increasingly clear that the submanune attack on commerce had been countered. The U-boats failed to impede either the transport of British troops to France or of U.S. troops to Europe and by Oct. 1918 the building of new ships had overtaken the sinkings. Aeroplanes and dirighle balloons were in use for spotting U-boats and for some time the latter had considered the Straits of Dover too dangerous for use.

With the advance of the Allied armies the Flanders bases had to

be abandoned and the U-boats in them blown up

By the end of World War I the British grand fleet possessed a submarine flotilla designed to act with it as a tactical unit, but no opportunity occurred for testing its capabilities in battle. At the Annistice 138 U-boats were surrendered and brought to Harwich

#### WORLD WAR II

Opening Stages.—Conditions at Scaps Flow in 1939 hore an unfortunate issemblance to the conditions in 1941. In 1914 there were no nets, only a few old guns, in 1939 there was only a single line of antisubmarine nets, a few blockships and eight anti-arcraft guns. In each case the fleet had to evacuate the base temporarily for Loch Eve, a great disadvantage which entailed many extra hours steering to the focal points in the North sea and to the Sheland-Norway massage.

The 1914 evacuation was the result of a false alarm of a submarine in the Flow, the 1939 one was occasioned by the sinking of HMS "Royal Oak" by a submarine and the bombing of

HMS "Iron Duke" a week later.

In Aug 1939 Germany had 60 U-boats ready for action The Bittish fleet and coastal command was prepared, but conditions were less favourable to Great Bittain in some important respects than they were nyi4. From the start Erre detared itself a neutral and Bittain was deprived of three valuable bases, Queenstown, Berchaven and Lough Swilly. Italy was obvously going to join Germany, and after the fall of France and Norway all the coast of Europe from the North cape to the Spanish frontier was hostile. This entailed Britain's abandomment of the southwestern approaches to the English channel because of the threat from the arr, a much longer sea passage round the north of Ireland and heavy additional convoy commitments for Scotland and the North sea.

The German U-boats had changed little in size and shape between the wars, but had improved in speed and were able to remain submerged for long periods without suffacing, especially in 1044, when they were equipped with the schnoles. They could go far deeper than before, which was not at first realized by the Isitish, and they were armed with electric torpedoes which had no discharge bubbles and left no track. Great advance had been made by both belligerents in avaition and means of communication, and the mistitution of the British constal command for close and active cooperation with the fleet was to have most important results. The bomber command also played an important part in sea warfare as well as on land

To the British submannes and the aircraft of the coastal command fell the important duty of carrying out the close blockade of Germany's coasts and harbours, England's traditional weapon against continental enemies in all its European wars. This proved an arduous, perilous and most monotonous duty, which extended over a constantly increasing area as Germany overran country after country.

Germany waged unrestricted warfare from the outset, and the British convoy system was in operation from mid-Spt. 1939 as far as the supply of escort vessels would permit. At the start the U-boat attack was connectitated on the focal areas and was countered by surface patrols assisted by spotting aircraft from carriers, but after the sinking of H.M.S. "Courageous" this practice was abandoned. The British occupation of Iceland and the Faerree Islands in 1940 provided new escort and air bases and forestalled their occupation by Germany.

Great Briain had invented the ascir. (Allied Submarine Devices Investigation committee), a great improvement on the hydrophone, as it gave the direction of the U-boat accurately Radar had been invented but was not titled in the Allantic escort vessels uil 1941. HF/DF (high-frequency direction-inding apparatus) was introduced in 1942. The question of convoy escort had received attention before the start of World War II.

In view of the possibility of a German-Japanese attack, Pres. Franklin D. Roosevelt and Winston Churchill had, as early as 7940, agreed on Plan "Rainbow" prepared by their chiefs of staff for joint action if necessary. Under this plan the defeat of Germany was regarded as the first objective and that of Japan as the second. Consequent on the Japanese attack on Pearl Harbor on

Dec 7, 1941, the combined chiefs of staff committee was formed with headquaiters in Washington, D C Great Britain underteok responsibility for the east Atlantic. Mediterranean and Indian occans, and the U S undertook the west Atlantic and the Pacific with the assistance of Australia and New Zealand

Battle of the Atlantic.—At the beginning of World War II, as in 1914, Great Britain was very short of escort vessels, was mediate steps were taken to mass-produce the necessary small craft. The German procedure was to attack convoys at periscope depth by day, or single shape with guafire, and magnetic mines were laid in large quantities, causing many casualties until the simple antitode of degaussing shaps was discovered

Toward the middle of 1940 Germany withdrew its U-boats for use in the Norwegan campaign, thus affording a temporary feel to the convoys, but the overrunning of France and Norway provided Germany with a number of new base. Britain had valued the use of the southwestern approaches, and the occupation of Norway brought the U-boats much nearer to the for-

point of British commerce

In March 1941 there was a change in U-boat tactics Because of their superior speed they found they could attack on the surface at night, but Britain was fitting radar in the escort vessels and in this month it made its first kill. Fear of invasion necessitated a reduction of convoy escorts and this caused the toll of shipping losses to rise considerably, especially as the production of U-boats exceeded sinkings. However, Great Britain increased the coastal command, and new aircraft of greater range enabled the air patrols in focal areas to drive the enemy into the open ocean Germany also produced a better aircraft, the Focke-Wulf, but, because of the lack of co-operation between the navy and the air force, the results were less satisfactory. Though they were attacking as far west as longitude 40°. Great Britain now had new air bases in Iceland and Newfoundland and could provide escorts for food convoys to Halifax, N.S : Gibraltar; and Freetown, Sierra Leone. Germany had to devise some new method of attack.

The Pack Attack.—The new idea was to attack a convoy with a number of U-basts over a short period of time so that, if some boats were discovered and counteratusched by the escorts, other words, they shadowed the convoy and with their superior speed were able to concentrate on it and swamp the secorts. These pack attacks during 1941-43 were made at night. To deal with them the escorts were provided with "escort carriers," small arriers arranged and the secorts were provided with "escort carriers," small arriers, arranged carriers whose planes could search out the surrounding waters by daylight. Escort teams were given intensive training and instruction and they were kept together in units as far as possible, but the ausburst still increased.

U.S. Entry Into the War.—In spite of Plan "Rainbow," the U.S. was unprepared for submarine warfare when Pearl Harbor was attacked it had no convoy organization and lacked escort and arcraft. In Jan. 1942 Germany had so U-boats operating in U.S. coastal waters, causing very heavy losses. By May the U.S. had coastal convoys in operation and an consequence the U-boats shifted their attacks to the Cambbean area.

For a time the coastal convoys had an easer task but the Russian and Malta convoys suffered severely. The Russian convoy route had to be closed for a time, but not before an alternative supply route had been completed by rail through Iran. After the fall of France, with the exception of Spam, both sides of the Mediterranean from Gibrular to Egypt and Turkey were in the hands of the axis powers. Convoys from Malta to Alexandria had to pass through the narrow waters between Sicily and Tunis, "bomb alley" as it was called, where they were exposed to intensive attack from submainies and aircraft. Since May 1940 the Mediterranean had been closed as the supply route to the east, British shipping not only for India and the far east being sent round the Cape of Good Hope, but even that for Egypt, which entailed an extra 12,000 mil. steaming.

Convoys could get through to Malta only at great hazard. Nevertheless, the submannes based on Malta played a decisive part in the North African campaign, preying on the axis convoys supplying the North African armues. Up to the time of the ad-

vance of the 8th army from El Alamein, they and the air and surface craft based on Malta together sank 300,000 tons of shipping The part Malta played in Mediterranean operations was realized by Germany and an intensive attack in Maich 1942 was intended to reduce the island, but vital convoys got through and in spite of heavy losses they and the "magic caipet" kept the island supplied The magic carpet was a submatine ferry service which transported large quantities of essential gasoline and stores of all kinds from Egypt The German forces might have overrun Egypt but for the heavy losses of men and supplies caused by the Malta patrols

With the entry of Japan into the war Japanese submarines oper-

ated in the Indian ocean

The "Black Pit."-Though the whole of the east coast of North America was now Albed territory there was a large area of the North Atlantic which could not be patrolled by the coastal forces acting from Britain, Iceland and North America This area, known as the "gap" or "black pit," had to be crossed by the convoys When Germany decided it was advisable to avoid coastal command on both sides of the Atlantic, U-boat attack, organized and controlled from headquarters in France, was concentrated in this area The plan was to employ packs of up to 25 boats and send them independently to take up positions about 12 to 20 mi apart on a prearranged patrol line in the gap. No convoy could pass through this patiol line without being seen provided the line was complete, and "milch cow" U-boats kept the pack supplied with fuel and stores

The U-boats kept a lookout on the surface until a convoy was sighted The one sighting the convoy immediately dived and later noted its size, course and speed through its periscope. No tornedo was fired, but when the convoy was out of sight the Uboat surfaced and reported by wireless telegraphy to headquarters in France Headquarters picked up this report and repeated it back to the pack for information, together with instructions as to closing and making contact It was the duty of the boat which sighted the convoy to keep touch and report the convoy's move-When a sufficient number of U-boats had been collected, headquarters would order the attack, when the U-boats would get into position and speed in on the surface after dark

These pack attacks were devastating at times and the clisis of the battle of the Atlantic was reached during the foul weather in the early part of 1942. The general situation corresponded closely to the 1917 crisis That crisis was met by adoption of the convov system, but in 1942 there was no new method to be tried The only solution was more and more coastal command aircraft of longer range to reduce the black pit, more and more escort vessels, more research and much more intensive training of the escort groups

March was the crucial month and by April the German efforts began to slacken In May the wolf pack suffered three severe defeats and no further attack developed until September when the Germans tried their new acoustic homing torpedo. These torpedoes inflicted severe damage on the escorts but did not overwhelm them. The convoy was unharmed and the pack suffered considerable loss. This was the turning point of the battle of the Atlantic; the Germans found their losses too heavy and withdrew their U-boats for rearming and better equipment.

The Bay Offensive .- For months in early 1943 there had not been a single sinking in the North Atlantic. Teamwork had beaten the wolf pack attack. As soon as it was certain that the packs had been cleared from that area, Britain turned to the task of sealing off the Bay of Biscay, to prevent their assembling in the North Atlantic again The support groups and the majority of the eastern strength of coastal command were switched over to present a strong barrier against the egress of the U-boats from the bay The acquisition of a new air base in the Azores in 1943 greatly assisted in this, as the Albes thereby obtained full air cover right across the Atlantic The offensive was now in the hands of the Allies, but this "flooding of the bay" was no easy matter. Coastal command was principally concerned close in shore while the surface forces operated farther out, but the Uboats were now provided with strong anti-aircraft armament and, acting in groups of four to provide mutual support, provided tough

opposition to the aircraft

In 1944 the U-boats were able to counter the flooding of the bay temporarily because of the invention of the schnorkel, which enabled them to remain constantly submerged and almost impossible to detect by radar The asdic had once more to be depended on Convoy battles flared up again, but the U-boats sustained heavy losses and in March they were withdrawn in order to prepare for the Allied invasion

The Midget Submarine.—A human torpedo had been invented in Italy which could be navigated by a crew of two men seated astride of it and by means of which they could secure explosive charges under the bottom of a ship at anchor Several of these craft were ready in Aug 1941 and, by infringing the neutrality of Spain, Italy arranged a depot ship off Algeriras from which these craft could attack ships at anchor off Gibraltar These intrend men succeeded in sinking of damaging 14 merchant ships

Germany had prepared almost maccessible bases for its capital ships many miles up the Norwegian fiords In recesses protected from submarines by patiols, mine fields and lines of antisubmarine and antitorpedo nets, berths had been prepared under overhanging cliffs surrounded by high mountains, which rendered the ships immune from bombing attacks by aircraft. In three such berths the "Tirpitz," "Scharnhorst" and "Lutzow" lay secure and able to slip out when required In order to deal with them Great Britain devised, with the utmost secrecy, a midget submarine able to pass under nets and lay powerful explosive charges under the bottom of a ship at ancho: Special crews were trained to man these craft and it was intended to make an attack on the ships early in 1943 with a force of six boats, but the boats and crews could not be got ready in time and the operation was postponed until the autumn The period Sept 20-25 would be favourable as regards duration of darkness and moonlight, and Sept 20 was selected as D-day A photographic unit in Murmansk procured full details of German dispositions and net defenses.

The six boats set out on Sept 11, 1943, each in tow of a submarine, three to attack the "Tirpitz," two for the "Scharnhorst" and one for the "Lutzow" It was a tow of about 1,200 mi, at eight to ten knots' speed, with frequent stops for ventilating, etc and occupied ten days. Bad weather was encountered and several tow ropes were broken. One boat was lost and one had to be scuttled but the remaining four arrived duly at the rendezvous and the tows were cast off Because of defects, one of the submarines had to abandon the attack. It was the only one that returned, but it brought back valuable information. Of the remaining three which carried out their attack on the "Tirpitz," one was sunk by gunfire or depth charges before it got inside the nets. the other two, after hair-raising experiences, placed their charges under the ship and with great difficulty managed to get back out-side the nets before the explosions They were sunk by gunfire when they came to the surface, but their charges exploded under the "Tirpitz" and damaged it so severely that it was unable to take any further part in the wai The crew of four of one boat was rescued and made prisoner, as were the captain and the second in command of the other.

Conclusion .- The U-boats interfered little with the great Allied landings in Europe and Africa. This was a result of the absolute secrecy maintained by the Allies as to time and place selected. the dissemination of misleading information and the strong antisubmarine patrols protecting the convoys. Before the Normandy landing Germany's concentration of U-boats in the channel ports was neutralized by the Anglo-U.S. air and naval offensive

The Allies won the battle of the Atlantic by a narrow margin This was due to: (1) their success in keeping just ahead of Germany in scientific research and invention; (2) perfect co-operation between the air and surface forces as a result of combined training; (3) their long-range shore-based aircraft which Adm Karl Dönitz acknowledged to be the most deadly threat to the U-boat; (4) the intensive training of convoy escorts, and (5) the dogged determination of the merchant navy and the escorting forces,

See Earl Jelucoe, The Crisis of the Naval War (1921), W. D. Puleston, The Influence of Sea Power in World War II (1947). (1947). (R. N. Ba.)

# U.S. SUBMARINE WARFARE IN THE PACIFIC, WORLD WAR II

While the US navy, as a whole, was placed on the defensive by the crippling Pearl Harbor raud in Dee 1911, a vigious and determined oftensive campains against Japan was immediately commenced by US submaines. The effectiveness of this underwater war is indicated in the final compilation of Japanese navul and merchant marine losses, which shows that US submarines accounted for more than half the tonnage destroyed. The nature of operations in the Pacific made the submarine a valuable weapon, both strategically and tactically. The war against Japan was primarily a naval war, with ground and air sway primarily a naval war, with ground and air sway primarily a naval war, with ground and air sway with naval support,

United States naval strategy, from the first, was based on two minoptant atactors in the Japanese economy the empire was de-pendent on great amounts of imports, particularly oil and rubber pendent on great amounts of imports, particularly oil and rubber to turn out sufficient shapping to bring in such raw materials from southeast Asia and the Indies and at the same time carry from southeast Asia and the Indies and of the same time carry of of military operations across the Pacific Accordingly, US. submanines concentrated their attention on stopping sea-borne movement of Languese suppoles and reducine its interchain trainer.

The principal US submarine base in the Pacific was at Pearl Harbor, the submarine fleet there was undamaged in the Japanese raid With the Asiatic fleet, based in the Philippine Islands, was a smaller force of submarines Duning the Japanese advance through the Netherlands Indies and the southwest Pacific islands, submarines from both the Asiatic fleet (crognamed early in 1942 as the 7th fleet and hased on the Australian ports of Brisbane and Fremantle) and the Pacific fleet ranged across the entire theater of operations, taking an early toll of Japanese shipping. After Guam was retaken in Aug 1944, Pacific fleet submarines operated out of that base

In the southwest Pacific area, U.S. submarines offered support to Allied forces, delayed the Japanese advance where possible and metrupted lines of communication Operating far beyond the effective range of surface or aeral support, they carred their determined attacks deep into Japanese home waters. The very knowledge of their presence in areas under exclusive Japanese domination had the effect of slowing up Japan's operations, while their persistent attacks on sea lines brought a ringing score of slipping the present of the communication of the com

During the first year after the war commenced, U.S. submatines accounted for 50,390 tons of Japanese shipping by sinking 134 anaval and merchant ships. In the second year, 1943, the score went up to 384 sinkings for a total of 1,341,963 tons. By this time the U.S. submarine building program was in full swing and in 10,44 U.S submarines sent to the bottom an armada of 492 ships with a total of 2,387,976 tons, not including merchant ships of less than 1,000 tons. Hundreds of these smaller vessels, such as junks, schooners and barges, were destroyed by gunfar from surfaced submarines. With the toll of sinkings mounting, the Japanese found it uncreasingly difficult to seem surple kines over.

found it uncreasingly difficult to keep supply lanes open. By 1045, U.S. submarines had so depleted the Japanese fleets that they managed to sink only 133 ships for a total of 496,879 tons before the war ended. Japanese shipping was hard hit and what was left was confined chiefly to Asistic coastal waters and the protected reaches of the Japan sea At the time of the Oklinava landings, U.S. submarines had completely stopped Japanese sea traffice to the East Indies and Indontina and in the next month they commenced hunting down the last remnants of Japanese sea power in the sea of Japane.

Although the submarine war was directed mainly against supply (unkers, cargo ships, transports, etc.), the U.S. craft went after bigger game whenever possible and sank a total of 189 combat craft, including I battleship, 4 carriers, 4 secont earriers, 5 heavy cruisers, 9 light cruisers and 193 submarines. In this connection, it should be stressed that, while a submarine is always a hunter, the tactical stitution frequently made the submarine the object of

a determined hunt. While 46 US submarines were lost in such attacks, they never accepted the role of the hunted. Always on the submarines were accepted the role of the hunted. Always on the previously mentioned 4, all paneses destroyers, the principal sub-hunters, as well as 60 other secort craft also employed in anti-submarine warfare. As a result, Japanese forces were often hard-pressed for sufficient escort craft to protect their shipping adequately.

At the time U.S. submarines were patrolling various strategic areas in their hunt for Japanese shipping, others were employed in operations more closely connected with the usual concept of naval warfare. In the battle of Michwy, (June 1942), submarines assigned to task force 17 served as socuts to report the advance of the Japanese feets, and the "Nautubus" assisted in the kill of the carner "Soryu". In Aug. 1942 the "Nautubus" and "Argonaut" landed marine raiders on Makin in the Gilbert Islands

In the North Pacific, submarines operated with task force 8 in repelling Japaneses reinforcements for their Aleutana garsisons in the summer of 1942; the "Grunion" and \$5-27 were lost in these operations. The outstanding victory of task force \$8\$ in the battle of the Philippine asc [June 1944] was partly a result of the fact that submarines shadowing the Japanese fleet were able to give Adm Raymond A Spruance advance warning of its thrust into the central Philippine area. In this battle, the "Albacoro" and "Cavalla" sank the Japanese carriers "Taiho" and "Shokaktu", as an overall result, the U.S. navy terminated the effective use of Japanese carrier awation for the rest of the war.

Agan, in the battle for Leyte gulf (Oct. 1944), US submarines succeeded in surprising the heavy 1rst diversion attack force of the Japanese fleet; the "Dace" sank the heavy cruiser "Maya" and the "Datter" sank another, "Atago", while a third of the six cruiser assigned to that force was badly damaged 'The "Datter" was grounded during this engagement and destroyed by U.S. forces,

Special duties assigned to US submarines during the war included reconnaissance, rescue, supply and lifeguard missions, Submarine reconnaissance could be made in waters where other vessels dared not go. Submarine recounsissance could be made in waters where other vessels dared not go. Submarine rescue was effective for the same reason, the final stage of Gen. Douglass MacArthur's excapa from the Philippine Islands before the fall of Corregion's example by submarine. A valuable cargo of gold was likewise removed from the Philippines shortly before the Inanaese invasion.

In the Philippines and Netherland's Indies, submarines were used to supply Allied forces, both before and after the Japanese occupation. Vital medical supplies were taken into Corregidor by submarine before the fall of that fortress, and various guerilla forces in the slands were supplied with arms and other necessities.

The lifeguard activities of submarines commenced on a minor scale, with the occasional chance rescue of the survivors of a ditched plane. As both air corps and navy carrier strikes against the Japanese increased in strength, the problem of rescuing personnel of planes downed in cenny territory became increasingly important and submarine lifeguard vessels were included in the plans for such attacks. In one such assignment, during a raid on Truk, the "Tang" picked up 22 airmen. More than 500 aviators were thus saved from death or capture.

Other activities of submarines included mine laying, charting dangerous or little-known waters and even raids on Japanese soil. Volunteers from the "Barb" once paddled ashore in rubber boats to blow up a Japanese train, and this submarine, as well as others, created havoc and destruction along Japanese coast lines by gun and rocket bombardment of ports, factories, refineries and other installations.

The antisubmarine phase of the Pacific campaign commenced on Dec. 10, 1941, when navy carrier planes sank the first Japanese submarine of the war and, incidentally, the first naval vessel lost by the Japanese to any power. Approximately 120 more Japanese submarnnes were to go down, victim to U.S. navy ships and planes, before a U.S. submarine got the last Japanese submarine and last major Japanese naval vessel to be sunk on Aug. 14, 1945.

Principal participants in the role of sub-sinkers were destroyers and their new World War II offspring, the destroyer escorts, With sonar (electronic underwater detection device) and depth charges, later augmented by hedgehogs (much smaller but power- basic matter from which all other materials have issued It desigful explosive charges dropped in greater numbers than possible nates, accordingly, the "beginning" of all becoming at large and with depth charges), these craft constantly improved their technique of hunting and sinking submarines and were mostly responsible for the score of 63 sunk by US surface craft

The advantage in using hedgehogs was that, unless they actually hit a submarine, they did not explode, whereas the depth charges went off at a predetermined depth and the resulting underwater disturbance hampered further tracking of the target if it was not hit.

Destroyers and escorts usually hunted in groups, with one or more ships tracking the submarine by sonar while another followed a course plotted to intersect the submanne's track, at which point an attack was made In such operations, the destroyer escort "England" was credited with sinking six submarines in a period of two weeks US submarines were also successful in hunting undersea craft with sonar and sinking them with torpedoes A total of 23 submarines went to the bottom as a result of attack by U S. underwater craft: the "Batfish" was credited with sinking three submarines in four days.

Because they usually operated alone and most attacks on them came when submerged, a submarine's sinking generally resulted in the loss of the entire crew. The "Darter," \$-39, \$-36 and \$-27 were stranded and all on board saved, the "Sealion" was bombed but later destroyed by her own crew with a loss of only five men; the badly damaged "Peich" had to be abandoned by her crew. who were captured and imprisoned. In varying numbers, survivors of the "Grenadier." "Sculpin," "Tang." "Tullibee" and S-44 were also taken as prisoners of war by the Japanese. The "Tang" was destroyed by one of her own torpedoes which boomeranged. In the total of 52 submannes lost in wartime operations, the U.S. lost 374 officers and 3,131 men.

No account of submarine warfare in the Pacific could be complete without reference to the part played by British and Netherlands Indies submarines; about 15 of the latter alone participated in the hopeless but heroic campaign against superior Japanese forces in the early months of the war, with heavy losses. Dutch submarines were credited with the first submarine kills of both Japanese naval and merchant vessels Approximately 60 Japanese vessels were sunk by Allied submarines in the southwest Pacific

Command of the original Asiatic fleet submarines was held by Rear Adm. John Wilkes, U.S.N., while the Pacific fleet craft were led by Rear Adm, Thomas Withers. With the organization of the southwest Pacific force, later the 7th fleet, the Asiatic fleet boats came under control of Vice-Adm. Charles A. Lockwood, Jr., until that officer took command of Pacific fleet submarines Seventh fleet submarines were subsequently commanded by Rear Adm. Ralph W. Christie and Rear Adm. James Fife, Jr., U.S.N

SUBMARINE MINES: See MINES (NAVAL). SUBMARINE SIGNALS: SEE FATHOMETER.

SUBMEDIANT, in music, the sixth degree of the diatonic scale, as A in the scale of C. (See HARMONY)

SUBOTICA, a town of Serbia, Yugoslavia. Pop (1948) 112,551. It is the centre of an immense agricultural district, and in the adjoining territory of Puszta Telecska (369 sq.mi.) large herds of cattle are reared. The chief industries are the making of iron articles of furniture, railway trucks and boots. The town was occupied by Hungary during World War il.

SUBSTANCE. The concept of substance is that of a permanent substratum preserved through all changes. The term substance is Latin for the Greek ὑποκείμενον, "that which underlies," as the permanent "basis" of its "accidents" (συμβεβηκότα, e.g., Aristotle, Metaphysics IV., 30, 1025a).

Greek Philosophy.-To set forth this permanent Being which in all transformations remains identical, was conceived by Greek philosophy from first to last as one of its principal tasks. Greek Philosophy is essentially "ontology"; it aims at the determination of "Being as such" ( or \$ or; Aristotle, Metaphysics, 1, 2). In the characterization of this Being lies the difference between the various schools of Greek thought. In the natural philosophy of the Ionians it is first conceived as material Being; substance is the shaken only by the new scientific view of the world, which origi-

at the same time, an immutable unit, a uniform and constant "nature" (μία τις φύσις), which is neither subject to nor affected by becoming

But already in the next phase of Greek Philosophy, Heraclitus and the Pythagoreans replaced this material determination of substance by another type of determination. For them, the permanent consists not in an unchangeable material substratum, but in certain constant proportions which persist in all Becoming The true substance, the "essence" (ovola) of things is not sought in an individual thing, but, according to the Pythagoreans, in Number, this being the principle underlying all measured proportions; according to Herachtus in the immanent law, in the "Logos" that governs all events and retains them within definite limits. Here substance does not lie outside Becoming, but designates a law which pervades all Becoming and gives it its "form" This view forms the transition from the "physical" explanation of things to their "ideal," ie, mathematical and logical, explanation. The logical view of substance was developed by Parmenides and the Eleatic school True "Being" can be grasped only in pure thought. Thinking and Being are one; so, true Being is determinable only by predicates of thought. It is eternal; it is subject to no change of place, it is one and admits of no partition

This idea of logical identity becomes the determining motive in the further development of the concept of substance in Greek philosophy.

The systems of the "younger philosophy of nature" (Empedocles, Anaxagoras, Democritus) attempt to connect and reconcile this motive with the physical explanation of the universe They seek to exhibit within nature itself certain elements which, although themselves incapable of change, produce, by their mutual relationships, the manifold of reality and their changes

Atomism, especially, became of fundamental importance for the further development of the concept of Substance The idea of the absolute oneness of Substance is here abandoned; true substantiality is attributed to atoms which are infinite in number, but simple and indestructible. From the differences of position, shape, arrangement and spatial motion of the atoms results the manifold of sensible phenomena, which accordingly possess only secondary Being; genuine Being is attributable only to the atoms

and to empty space, which is required for their motion The classical systems of Greek philosophy, however, effect a decisive change. Instead of matter, pure form is made the basis of all substantiality. The form (είδος, ίδέα) is the one persistent element; unlike sensible phenomena which always "become" and never "are," it remains the same. Equal things can become unequal; the small, by growing, can become large; but the sdea of the equal, etc., remains what it is and suffers no change (Plato, Phaidon 99 sqq.). Thus, the idea forms that which alone has genuine, constant, true Being (ὅντως ὅν), while empirical objects, in so far as they have Being owe this to their "participation" in ideas. In the system of Aristotle, too, this interpretation of the problem of substance is retained, although he rejects the substantiality of pure ideas as taught by Plato For him, substance is the individual Being composed of "matter" and "form." But the specific function of determination belongs to the form: Logically substance is the ultimate "subject" of all predication, but which cannot be predicated of anything else. All our judgments refer to a Something of which they claim to be true; and this Something is that to which the judgment refers (Aristotle, Categ. V., Metaphysics, 1069a 18). From this "first substance" (πρώτη οὐσία), Aristotle distinguishes the species and genera as "substances of the second degree" (δεύτεραι οὐσίαι) They do not subsist in themselves, but only in the individual beings, the first substances, but they express the most general determinations without which individual beings could not be thought.

Descartes, etc .- The Aristotelian conception of substance determined for many centuries the form of western thought and metaphysics. Mediaeval Scholasticism was in its essence a philosophy of "substantial forms." This fundamental outlook was nated in the 17th century. The establishment of the helo-centric system by Coperincis and Keplei, and of modern dynamics by Galike, deprived the Aristotelian physics, cosmology, and metaphysics, of their foundation. The new concept of substance goes back historically to pre-Aristotelian philosophy, especially to doctrines of the Pythagoreans and of Democritus Substance is now conceived mathematically; it is that which, in all transformations of behomenae, remains unchangeable in manufact.

Thus, the problem of substance, or matter, is supplemented by the problem of motion. For also motion, more conceived as pure translocation, reveals a quantitative constitute, which makes it sometimes guishantial. In this sense, the Galilean doctine of motion is headed by the principal of merita, re, the theorem that the motion of a material point upon which no external forces are working, remains invariant in velocity and direction. Similarly, the mechanics of Descartier series on the principle of the "preservation of motion," se, the assumption that the so-called magnitude of motion, which is measured by the product of mass and in the whole world, through the archange of velocity, which takes place at the impact of bodies, no new quantity of motion can be created nor any existing one be destroyed, there occurs only a change in the distribution.

From this assumption, however, it follows that the world of bodies is a system completely closed in itself and incapable of suffering any interference from the outside. All action of body upon body, all "causality" within the realm of extension, iesis upon mechanical laws, mental, "immaterial" powers cannot act upon bodies, nor increase or diminish the sum total of their momentum. Between the worlds of "external" and "intenal" experience, between "matter" and "consciousness," no kind of transition takes place.

Through this viewpoint, the metaphysical doctrine of substance receives a decisive turn. Descarted edifies substance (Principal philosophies, r. 50) as that type of thing which exists in such a way that it needs no other thing for its existence Accordingly, the concept of substance is applicable only to the Being of God Next to it, there subsists, as relatively independent and mutually irreducible entities, consciousness and the world of bodies. The fundamental problem consists now in determining how these two essentially different substances can enter that kind of commentum which is exhibited in the concrete existence of mar. For main is a whole consisting of "thought" and "extension," of "soul" and "body of the consisting of "thought" and "extension," of "soul" and "body of the consisting of "thought," then metaphysical difference, gives rise to the systems of Spinosism, of Occasionalism, and of the doctrine of monads

Locke and Hume—A new and decause turn is given to the problem by the critical analysis of cognition which starts with Locke and Hume and reaches ats completion in Kant. The characteristic of this turn lies in the fact that the weight of the problem is transferred from the realm of metaphysics to that of epistemology. Substance appears as a "category" as a fundamental compet of pure understanding. That this concept is not derrusole directly from experience, that it cannot be thought as the mere "copy" of a sense-impression, this is emphassized also by Locke

The privilest and sensualist conception of knowledge, which they represent, is thus confronted with the question whether the concept of substance, not being reducible to empirical sources, retains any "objective" significance or is merely "subjective" as a kind of natural illusion of the human understanding. Locke starts with the assumption that true reality belongs only to the simple, sensible "ideas," to the sensations of colour, sound, etc., whereas the understanding cannot create any new reality, but can merely connect these ideas in certain modes with one another. Such a mode of connection is represented by the concept of substance. What the senses deliver individually, is thereby connected; the changing states and properties being united in one "substratum," or "bearer." But the idea of a perisatent thing as "bearer" of the changeable qualities is, in Isself, use portuger, corresponds. Not

adding anything new to the sensible elements in which all our knowledge of reality is rooted, it originates in the mere habit of correlating with one another many such elements on the basis of their regular conjunction, their spatial coexistence.

This correlation, however, is not a real, objectively founded connection We know, for instance, that in the thing commonly called by the name of "gold," a certain density, a certain colour, a certain specific weight, etc., appear regularly in conjunction, but the mecasity of this conjunction, the "ground" for the combination of the various qualities in this, and no other, mode, is not understood. Even if there be such a ground in reality, in must be undersovestable and unntelligable (Locke, Essay of the Human Understanding). The subjective nature of substance is emphasized even more by Hume.

The concept of substance, according to Hume (Treatise on Human Nature), is not reducible to any sense impression, it has, therefore, no positive significance for knowledge, but is merely a product of the imagnature power which combines what is requently together, into one idea and gives it one name. This criticans of the concept of substance refers to the realm of external as well as of internal experience. The supposition that a material stime of the concept of substance refers to the realm of external as well as of internal experience. The supposition that a material thing as such persists even when not perceived is denied objective significance, and the concept of "soul-substance" is rejected and the "I'v declared a mere "bundle of perceptions".

Kant.—Kant's Critaque of Pure Reason takes up the results of Locke and Hume, but it draws from them an entirely different epistemological conclusion. For Kant, too, substance is a pure concept of understanding, a form of connection established by pure thought. But this form of connection cannot be reduced to the emphreial rules of habit and association; it has universal and necessary validity, it is a synthesis a prior. The validity of his synthesis consists in the fact that it is the bass of experience itself. Without the idea of a Something pensisting in the stream of appearances, it would be impossible to establishs and to make intelligible that order of phenomena which we conceive under the name of "experence".

The proof, the "transcendental deduction" of the concept of substance is, accordingly, presented by exhibiting it as a constitutive condition of any possible experience. This implies, on the one hand, that it is indispensable for all experience, for all scientific cognition of nature, on the other hand, that it is designed for use in experience only, that its validity does not refer to "things-in-themselves" but to phenomena. The principle of substance, according to Kant, belongs to the "analogies of experience," ie, to those principles on the basis of which alone it is possible to set a fixed, objective time-relation between phenomena and to conceive them as "nature" coherent in itself and ordered according to universal laws Such an objectivation of time would be impossible without the category of substance. "The persistent is the substratum of the empirical notion of time itself, and it is on its basis alone that all temporal determination is possible For change does not affect time itself, but only its contents, only the concrete events which we conceive as following each other in time. Time itself does not change, but all change occurs in it as the "constant corollary of all Being of phenomena" However, the strictly "empty" time does not constitute any possible object of perception, in order to think of time as constant, as "duration, we must, therefore, presuppose a persistent element within appearance itself and oppose it to all that is merely changeable,

The concept of something persistent is, accordingly "the coadition of the possibility of all synthetic unity of perceptines, is, of experience; and in proportion to this persistent element, all being and all change in time can be viewed only as a modus of the existence of that which remains and persists." (Kritik der reinen Vermunit, and ed. p. p. 25 sept.

Recent Epistemology.—The contrast between Hume's and Kant's conceptions of substance, reappears in the recent epistemology. The further pursuit of the road of Hume leads to empiricism and positivism; the further pursuit of the road of Kant, logical idealism. For notifying the resemblency as devalored in

changing states and properties being united in one "substratum," purcism and posturism; the further purism of the read of Kant, or "bearer." But the idea of a persistent thing as "bearer" of the logical idealism. For positivist epistemology as developed in changeable qualities is, in itself, utterly empty; it represents a Avenarius 'Kriik der reinen Berfahrung (1883-09) and in the mere form of knowledge to which no content corresponds. Not writings of Ernst Mach (Beitrage zur Analyse der Empfindungen,

1886, Die Mechanik in ihrer Entwicklung, 1883, Prinziplien der Warmelehre, 1896), the concept of substance has an essentially biological significance It serves the "coronmy of thought" in-asmuch as it is a means of correlating a multiplicity of experiences, and grung them one name

But the unity of substance is a merely nominal unity What we call material substance is only "a relatively constant sum of sensations of touch and light associated with sensations of space and time" This constancy can never be considered absolute, only

relative, so that the identity of the "thing" is a mere function Critical idealism essentially agrees with this result, but differs from empiricism and positivism in the explanation which it gives. It, too, emphasizes the fact that, the further the sciencial cognition of nature progresses, the more the concepts of things are replaced by concepts of relations. The concept of substance resolves into the concept of function. But the concept of function is not considered as the expression of a mere "togetherness," of experienced facts, but as a genuine achievement of thought. It is the original form of connection as such, and of experience is the The concept of substance is to be replaced ultimately by that of invarance (E Cassiers, Mishance and Pluschian, 1923) [ECT.

SUBSTITUTIONS: See GROUPS.

SUBWAY, a subsurface passage. The term is generally used in the U.S. in connection with urban underground electric transportation to represent a railway operating either in a tube, a steel framework built in an open cut and then covered, or in any other type of tunnel.

(See NEW YORK (CITY): Transportation and Communication;

RAILWAYS, TUBE; and TUNNEL.)

SUCCESSION: see LAW OF SUCCESSION.

SUCCESSION, ORDER OF, IN GREAT BRITAIN. The heir to the king is ins oldest son; thus George II succeeded his father, George II. If the oldest son be dead, the heir is his oldest son; thus George III, his father Frederick being dead, succeeded his grandfather, George II. If there are no sons, a daughter succeeds, in the event of there being more than one daughter, it is assumed that the daughters succeed in order of semonity.

If the king dies without son or daughter the succession passes to the next oldest brother and his offspring; thus William IV followed his older brother George IV, the latter leaving no child, and Victoria succeeded her uncle William IV in preference to her remaining uncles who were unitor to her father.

If the king dies without issue and without brother or sister (they also without issue) the right of succession goes back to the preceding generation—the oldest son or his descendant, or, barring sons, the daughters, in the order of seniority

SUCCESSION DUTY: See LEGACY DUTY AND SUCCESSION

Dury SUCCESSOR STATE, a term applied to a state formed wholly or partly out of another state which has ceased to exist, thus forming a wholly distinct political entity, but inheriting certain obligations (e.g., the repayment of a public debt) in-herent in its origin. As neither Turkey nor Russia has ceased to exist, although their forms of state have changed, the only modern states to which this term can strictly be applied are those which the treaties of St. Germain and Trianon describe as "States to which territory of the former Austro-Hungarian Monarchy is transferred and States arising from the dismemberment of that Monarchy." These states were taken by the authors of the above treaties to be Czechoslovakia, Poland, Rumania and Yugoslavia. East Galicia, which, like these four states, had been recognized as its successor by the Austrian "Liquidierungskabinett" of Oct. 1918, failed to maintain its existence, and the plea of the Austrian republic to be considered a successor state was rejected by the Powers at St. Germain, who affirmed its identity with the old Austria. The successor states were acquitted of moral identity with the old monarchy, and were thus not called on to pay reparations, but were required instead to pay "contributions towards the Allied cost of liberation" on a scale based on prewar taxation. Among other obligations was the signing of the minorities treaties. Italy signed no minorities treaty, but

consented to regulate the financial position of the territories which it had inherited from Austria and Hungary on a basis similar to that taken for the successor states (C A M)

SUCCINIC ACID is an organic compound occurring in amber (3% to 4%). Irom which fossibled gum it is obtained by distillation. It is also found in other resins, in lignites, in fossibled guid in many plants belonging to the Composite and Papaveraceae. It occurs in the animal kingdom, as in the thymus gland of calves and in the spileen of actite.

Chemically, succinic acid, or ethylenesuccinic acid,

#### CO2H CH2 CH2 CO2H.

is a saturated dibasic acid which crystallizes in colourless prisms or plates melting at 186° C and boiling at 235° C. Its vapour readily loses water to form succinic anhydride (I), which crystallizes in plates melting at 120° C.

The acd itself is soluble in water, and its salts with the alkali and alkaline-earth metals are also soluble in water Barrus coinate is piecipitated from aqueous solution by alcohol, ferro succinate is insoluble in water and is sometimes employed in the analytical separation of iron from other metals. When heated with phosphorus trisublidie, sodium succinate vields throbher

Succinic acid is produced during the bacterial fermentation of ammonium tartual or calcium malate. It arises from the oxidation of fats and fatty acids by nitric acid. It may be prepared synthetically from ethylene, CHH, through ethylene dichloride, CHLC(8), ethylene dicyanide or succinonitrile, CHL(8N). The last compound yields the acid on hydrolysis Malcie acid, on wordowlysis Malcie acid, on wordowlysis Malcie acid, on wordowlysis Malcie acid, on wordowlysis Malcie acid, on the succinic acid on reduction with sodium amalegia.

Succupil chloride (formula II) is obtained by the interaction of phosphorus pentachloride and succinic acid. Succume anhydride (formula I), also produced by heating the acid or its salts with acette anhydride or by beating succinity chloride with anhydrous oxalic acid, is employed as an intermediate in colournakun, when it yields two brands of Rhodamine S (see Dvzs. SUNTHETIC) by condensation with dimethyl- or diethyl-meta-aminophenol, NR,C,CH,OH.

Succinimide (formula III), produced by heating succinic anhydride in ammonia, crystallizes in colourless octahedra melting at 185°-126° C. and readily soluble in water This imide when

distilled with zinc dust furnishes pyrrole (q.v.).

Succhronitrile, CN.CH<sub>2</sub>.CH<sub>2</sub> CN, obtained as above and also by electrolysis of potassum cyanoacetate, is a colourless solid melting at 34°-55° C. On reduction with sodium and alcohol it is converted into the ptomaine alkaloid, puttersion (tetramethylenediamme), NH<sub>2</sub> [CH<sub>2</sub>]<sub>2</sub>,NH<sub>3</sub>, and into pyrollidine (tetramethylenediamme), NH<sub>2</sub> [CH<sub>3</sub>]<sub>2</sub>,NH<sub>3</sub>, and into pyrollidine (tetramethylenediamme), NH<sub>3</sub> [CH<sub>3</sub>]<sub>2</sub>,NH<sub>3</sub>,

Methylsuccinic acid or pyrotartaric acid,

# CO<sub>2</sub>H.CH<sub>2</sub>.CH(CH<sub>2</sub>).CO<sub>2</sub>H,

formed during dry distillation of tartaric acid, by heating pyruvc acid with concentrated hydrochloric acid, or by the reduction with sodium analgam of citraconic and measconic acids, is obtained in colourless prismatic crystais soluble in water and melting at 112° C. It forms an anhydride and its sodium salt heated with phosphorus trisulphide yields \$\textit{\textit{methydride}}\$ and its sodium salt heated with phosphorus trisulphide yields \$\textit{\textit{methydride}}\$ and isomeride of ordinary succinic acid, is obtained on hydrolyzing ac-yanopropionic acid, CH<sub>2</sub>(HC(X)).CO<sub>4</sub>H<sub>2</sub>, b. It for cystallizes in prams melting at 12° C and is soluble in water. Unlike ordinary succinic acid, it does not yield an anhydride on heating, but loses carbon dioxide and passes into propionic acid. See T. E. Thorpe, Dictionary of Applied Chemistry, vol. vi (1926).

SUCEAVA or Suczawa, a town of the Bukovina, Rum, on the river Succava. Pop. (1930) 17,101. It was from 1401 the

seat of the metropolitan of Moldavia and until 1565 the capital, its 14th-century church contains the grave of the patron saint of the Bukovina It was many times besieged by Poles, Hungarians, Tatars and Turks, and also suffered in World War I. Near by is the early 17th-century monastery of Dragomirna in the Byzantine style

SUCHET, LOUIS GABRIEL, DUC D'ALBUFERA DA VA-LENCIA (1770-1826), marshal of France, one of the most brilhant of Napoleon's generals, was the son of a silk manufacturer at Lyons, where he was born on March 2, 1770 As chef de bataillon he was present at the siege of Toulon in 1793, where he took General O'Hara prisoner During the Italian campaign of 1796 he was severely wounded at Cerea on Oct 11 Atter serving under Joubert in Tirol in 1797, and also in Switzerland under Brune in 1797-98, he was made chief of staff to Brune, and restored the efficiency and discipline of the army in Italy In Inly 1700 he was made general of division and chief of staff to Joubert in Italy, and was in 1800 named by Masséna his second in command His action contributed to the success of Napoleon's crossing the Alps, which culminated in the battle of Marengo on

In the campaigns of 1805 and 1806 he greatly increased his reputation at Austerhtz, Saalfeld, Jena, Pultusk and Ostrolenka He obtained the title of count on March 19, 1808, married Mile de Saint Joseph, a niece of Joseph Bonaparte's wife, and soon afterward was ordered to Spain. There he was commander of the army of Aragon and governor of the province, which in two years he brought into complete submission. He annihilated the army of Blake at Maria on June 14, 1800, and on April 22, 1810, defeated O'Donnell at Lerida.

Suchet, now a marshal of France, in 1812 conquered Valencia and received the title of duc d'Albufera da Valencia (1812). When the tide set against the French Suchet defended his conquests step by step till compelled to retire into France, after which he took part in Soult's defensive campaign. By Louis XVIII he was made a peer of France, but, having rallied to Napoleon during the Hundred Days, he was deprived of his peerage in 1815. died near Marseilles on Jan. 3, 1826. Suchet left unfinished Mémoures dealing with the Peninsular War; these were printed by St. Cvr-Noguès in 1829-34.

See C H Barault-Roullon, Le Maréchal Suchet (Paris, 1854); Choumara, Considerations militaires sus les mémoires du Maréchal Suchet (1840) See also Bibliography in article Peninsulae War.

SUCKLING, SIR JOHN (1609-1642), English poet, was born at Whitton, in the parish of Twickenham, Middlesex, and baptized there on Feb. 10, 1609 His father, Sir John Suckling (1569-1627), had been knighted by James I and was successively master of requests, comptroller of the household and secretary of state He amassed a considerable fortune, of which the poet became master at the age of 18. He was sent to Trinity college, Cambridge, in 1623, and was later entered at Gray's Inn. He was intimate with Thomas Carew, Richard Lovelace, Thomas Nabbes and especially with John Hales and Sir William Davenant, who furnished John Aubrey with information about his friend. In 1628 he left London to travel in France and Italy, returning, however, before the autumn of 1630, when he was knighted,

In 1631 he volunteered for the force raised by the marquess of Hamilton to serve under Gustavus Adolphus in Germany. He returned in 1632 but during his short service he had been present at the battle of Breitenfeld and served in many seiges. He had a gift for verse that commended him to Charles I and his queen. Said to have been the best card player and the best bowler at court, Suckling says of himself in "A Sessions of the Poets" that he "prized black eyes or a lucky hit at bowls above all the trophies of wit." John Aubrey says that he invented the game of cribbage and relates that his sisters came weeping to the bowling green at Piccadilly to dissuade him from play, fearing that he would lose

According to Aubrey, Suckling was "the greatest gallant of his time." Aubrey adds that because of his reputation as a "gamester both for bowling and cards . . . no shopkeeper would trust him for sixpence, as to day for instance he might by winning be worth

200l and the next day he might not be worth half so much, or perhaps be sometimes minus nihilo '

In 1634 a great scandal was caused in his old circle by a beating which he received at the hands of Sir John Digby, a rival suitor for the hand of the daughter of Sir John Willoughby It has been suggested that this incident had something to do with his beginning to seek more serious society

Under the proclamation of 1632 against absentee landlordism, enforced by the Star Chamber, he retired to his estates in 1635. This leasure resulted in "A Sessions of the Poets" (circulated in manuscript in 1637) and a tract on Socimianism entitled An Ac-

count of Religion by Reason (printed 1646).

As a dramatist Suckling was noteworthy for having applied to regular drama the accessories already used in the production of masques His Aglaura, published in folio in 1638, was produced at his own expense with elaborate scenery Even the lace on the actors' coats was of real gold and silver The play lacked dramatic interest and, according to Richard Flecknoe, seemed "full of flowers, but tather stuck in than growing there." Other plays are The Goblins (1638) and Brennoralt, or the Discontented Colonel (1639, printed in 1646), a satire on the Scots, who are the Lithuanian rebels of the play His play The Sad One was left unfinished at the outbreak of the Civil War

Suckling forthwith raised a troop of 100 horse, at a cost of £12,000, and accompanied Charles on the Scottish expedition of 1639. He shared in the earl of Holland's retreat before Duns, and was ridiculed in an amusing ballad (printed 1656), in Musarum deliciae He was elected for Bramber (1640) to the Long Parhament; and wrote to Henry Jermyn, afterward earl of St. Albans, advising the king to disconcert the opposition leaders by making more concessions than they asked for. In May 1641 he conspired to rescue Strafford from the Tower and to bring in French troops. The plot was exposed, and Suckling fled beyond the seas Aubrey's statement that he took poison in May or June 1642 in fear of poverty is generally accepted Suckling's minor pieces have at times exquisite felicity of expression "Easy, natural Suckling," is Millamant's comment in Congreve's Way of the World (Act IV. Scene 1). Among the best known are the "Ballade Upon a Wedding," on the marriage of Roger Boyle, afterward earl of Orrery, ung, on the maringe of Koger Hoyle, afterward earl of Orrey, and Lady Margaret Howard; "I Prithee, Send Me Back My Heart", "Out Upon It, I Have Loved Three Whole Days Together", and "Why So Pale and Wan, Fond Lover" from Aglaura. "A Sessions of the Poets," describing a meeting of the contemporary versifiers under the presidency of Apollo to decide who should wear the laurel wreath, is the prototype of many later saures.

A collection of Suckling's poems was first published in 1646 as Frag-menta aurea. The so-called Selections (1836), published by Alfied Imgo Suckling, author of the History and Antiquities of Sulfolk (1846-48), with Memous based on original authorities and a portrait after Van Dyck, is really a complete edition of his works, of which W. C. Hazhtt's edition (1874; revised ed., 1892) is little more than a reprint with some additions. The Poems and Songs of Sir John Scuckling, edited by John Gray and decorated with woodcut border and inning. by Charles Ricketts, was artistically printed at the Ballantyne Press in 1896. In 1970 Suckling's works in prose and verse were edited by A Hamilton Thompson. For anecdotes of Suckling's life see John Aubrey's Brief Lives, Clarendon Press ed., vol il, 242.

SUCRE, ANTONIO JOSÉ DE (1795-1830), was born on Feb. 3, 1795, at Cumaná, Venez, where his family had for generations held a position of importance. He had only a meagre education and turned early to the profession of arms. In 1811 he was placed in charge of the republican engineers at Marganta, with the rank of heutenant. In 1821 he acted as Simón Bolívar's agent in the campaign against Spain in the presidency of Quito. There in 1822 he defeated the Spanish forces at the battle of Pichincha which definitely ended the power of Spain in that

In March 1823 Peru accepted Bolivar's offer of services in its struggle for independence, and a month later Sucre went to Lima as Colombia's commissioner. Bolivar arrived at Callao on Sept. 1 and was appointed by congress to the command of the patriot forces. During the preliminary stages of organization Sucre served as Bolivar's lieutenant. In Feb. 1824 Spanish troops reoccupied Lima. Congress immediately declared Bolívar "supreme political chief," and he in turn placed Sucre in command of his troops

At the end of July 1824 the aumy which Rolivar had been organizing gathered near Lake Reyes in the Peruvian uplands, and on Aug 6 Sucre defeated the Spanish aimy under Canteria in the battle of Junin. Withdrawing to Cuzco, Canteria waited for additional troops and then marched upon Sucre After two months of maneuviring, Sucre, on Dec 9, faced the combined forces of Spain under Viceroy la Serna on the plain of Ayacucho and utterly routed them

After the battle Sucre and Canterac squeed a treaty of capitulation arranging for the total evacuation of lower Peru by the Spannards Carrying his work of reconquest into the distitct of Charcas or upper Peru—now Bolivia—Sucre convened a deliberative assembly, which on Aug. 6, 1825, declared upper Peru independent of Span and proclaimed it a new state under the name of Rembblica Bolivia.

The liberator was named first president, Sucre to be chief excentre in his absence. In Dec. 1825 Bolivar transferred he authority to Sucre, who resigned May 25, but was immediately elected provisional president. In Feb 1826 the Bolivan congress adopted the famous constitution which Bolivar had drawn up for them, and in October Sucre was elected constitutional president.

p. 1. Mouras an awhward position. The native leaders objected to the presence of a foregare, Sucre fretted at the lumitations to his power, and doubted the practicability of Bolivar's constitution. A natury of soliders at Chaousaca in Apail 1888, followed by an invasion from Peru, crystallused his determination to resign. On Aug. 2 he made his last address to congress and soon afterward moved to Quito, resolved to reture to private life. But in Jan. 1830 he was chosen president of a constituent congress called by Bolivar as a last expedient to preserve the unity of Great Colorn-bits, and was one of the special commissioners appointed to consider ways and means. The plan failed, and on his way back to Quito he was kalled by assissains in the forest to Berustros, near the town of Pasto, on June 4, 1830. Sucre stands today with Bolivar and San Matria as a zeat liberator.

SUCRE, legal capital of Bolivia. Pop. (1950 census) 40,128, of whom many are Indans and mestizos. The city is in a delevated valley opening southward on the narrow ravine through which flows the Cachinayo, the principal northen tributary of the Pilcomayo. Its elevation, 8,532 ft, gives it an exceptionally agreable clumate. Petitic valleys provide fruit and vegetables, while the vineyards of Cinti supply wine and spirits. The city has broad streets, a central plasa and a prado.

The cathedral, dating from 1553, was noted for its wealth; the president's palace and halls of congress are no longer used as such; the cabildo, or town hall, a mint dating from 1572, the courts of justice and the university of San Xavier, founded in 1624, are

Sucre is the seat of the archbishop of La Plata and Charcas, the primate of Bolivia. It is connected by rail and highway with Potosi and by a poor road with Cochabamba. A petroleum topping plant was completed in 1949, and the city is connected by pipe line with the Camiri fields.

The Spanish town was founded in 1538 on the site of an Indian village called Chaquisca, or Chuquichaca ("golden bridge"), and was called Charcas and Ctudad de la Plata by the Spaniards. It was the first city of Spanish South America to revolt against Spanish rule—on May 25, 1809. In 1840 the name Sucre was adopted in honour of the first president of Bolyau (q, v).

SUCROSE: see Sugar. (J. W. Mw.)

SUDAN (Arabic BILAD-AS-SUDAN, "country of the blacks," of the Markey of the Markey of the Sahara), the helt of country which extends across the continent of Africa from Cape Verde on the Atlantic to the highlands of Abysshia and to the Red sea. It is bounded on the north by the

Sahaa and on the south by the martime counties of West Africa, by the Congo basın and by the equatoral lakes. Within this by the Congo basın and by the equatoral lakes. Within this betta are three moderately well-defined but irregular zones of climate and vegetation the arid desert steppe stretching from coast to coast just south of the Sahara, an intermediate zone of grassy plains supporting varieties of mimosa and scane, and the tropical zone of denser vegetation and arable land merging into the equatorial zone of dense forests, which terminates on the east-in the mountains and lakes of Uganda. The rainfall varies from 8-roin on the desert fringe to 40-50 in in the southern, equatorial zone. There are large areas in which the ruinfall would appear to be sufficient for cultivation but in which the ligh rate of evaporation makes agriculture without irrigation impossible. High temperatures prevail throughout the year. It is believed that andity is increasing in the Sudan and that desert conditions are spreading southward.

The Sudan is a plateau, averaging somewhat less than 1,500 ft in altitude, in which isolated masses of the primitive tableland rise above the general level. Its length is more than 3,600 mm and its average width slightly less than 1,000 mm. For moie detailed information 560 BAGRAM, BORNU, CHAD, FRENCH EUA/TORIAL APRICA, FRENCH WEAT AFRICA, NICER, NICERIA; SHARI, SUDAN, ANGLO-ECHYTHA; SUDAN, FRENCH, WADAI

Characteristics of the people are black or very dark brown skin, woolly hair, a broad nose with wide nostrils and thick lips they are fairly tall, the men averaging 5 ft. 8 in. The type has been modified by Hamitic invasions from the north. The West African Negro is a cultivator and not a pastoralist except Wester foreign influence has made him so. In the central Sudan Hamitic blood has nermeated more than in the west.

(See also HAUSA; SUDAN, ANGLO-EGYPTIAN Population; and SUDANIC LANGUAGES, with the articles on the peoples therein mentioned)

(K C B)

SUDAN, ANGLO-EGYPTIAN, the easternmost territory of the Sudan (g v), consisting of 95,500 ex mit under the joint sovereignty of Great Britan and Egypt, bounded by Libya on the extreme northwest, by Egypt on the north, by the Red sea and by Abyssians (with Entrea) on the east, by Kenya, Uganda and the Belgian Congo on the south and by the French Equatorial African regions Ubang-Shari and Chad on the west. It extends roughly 1,300 mi. from north to south and more than 1,000 mi from east to west.

to Westwie Peatures.—The Anglo-Seppian Sudan consists of a Jain, with a general altitude of 1,105-1,050 of above sea devel, bounded on the west by the bills of the Nile-Congo were devel, bounded on the west by the bills of the Nile-Congo were devel, bounded on the sea thy the Ethoppian mountains and the Red sea ranges to the north of them. The Nile runs through the centre of the plain from south to north. The three natural zones which extend irregularly across the whole of Sudanic Africa termanate in Anglo-Seppian Sudan

hummocks and hills of basalt, granute and lumestone. The intermediate zone lies between lat. r. r. N. and 16° N. and comprases Darfur, Kordofan and the Nuba mountains, west of the Nile; the Gearm between the White and Blue Nules, south of Khartoum; and the fertile plain between the Blue Nile and the Eritrean and Abyssiana hills. The main feature of this zone is the oas, an area of undulating sand, which merges in the desert of the northwest. The sand absorbs all the rain, which is sufficient for vegetation to fix it. Toward the south, and particularly in the southwest, the surface undulations disappear and a flat, sandy plain is formed with savannah forest (short grasses and trees with gum arabic acacia.) From the Eritrean border near Kassala plains of dark, clayey soil (known as badob or "cotton soil") extend south to about lat 6° N. along the eastern frontier and westward into

the Bahi el-Ghazal and Equatoria provinces, groups of granilic hills rise from the surface of the plain, which is covered with grass or savannah forest and is extensively cultivated, but the southern hint of the dark-soil belt is ill defined and it merges gradually into the tropical zone

The southern tropical zone is one of red soil, where lateritic ironstone appears below the surface Grass and trees grow freely and the soil is readily cultivable

The region of the Red Sea hills is distinctive In the valleys between the hills moisture is sufficient to maintain scrub in north, in the south toward Entrea vegetation is almost luxurant. The sandy plain between the hills and the sea affords grazing, there is some cultivation in the wall beds. Coral teefs fringe the cost, which is mediated by the cost, which is mediated by the cost, which is mediated by the cost which is mediated by the cost, which is mediated by the cost which is the cost which is mediated by the cost which is the cost wh

Climate.—The predomnant restures of the climate are high temperatures, extreme dyness in the north and humd, tropical conditions in the south Rainfall is a dominating fattor in the country's economy. It occurs, with long intervals, in the northern desert, but Abu Hamed is normally the northern limit of the annual rains. The period and the amount of rain increase from north to south in a steep gradient for example, at Gambela, lat 8° N, the average annual rainfall is 5° n, while lattle more than one-eighth of this amount fails at Khartoum, soo m farther north. Except on the Red sea coast, where half the precipitation occurs in the autumn, from 50% to 75% to 75% of the rainfall is deposted in June, July and August

North of lat 12° N the mean temperature is at its lowest in January and usually attains its maximum height in mid-May or early June, a maximum of 126 5° F has been recorded at Wadi Halfa in April South of lat. 12° N the maximum occurs in March or April and the minimum, under the influence of the southerly monsoon and the attendant rainfall, is sometime in July or August Maximum temperatures in the southern Sudan usually do not exceed 110° F, and the range of temperature is much less. From January to May northerly winds prevail throughout the country With the onset of the rainy season an area of southerly winds extends, in May, from the south as far north as Kassala and in June covers the country with the exception of some northern stations and the Red sea coast From May to July dust storms, known as habubs, are frequent where conditions are suitable for example, at Khartoum, where the surface of the land is stirred by much traffic, and at Kassala and at Tokar, where the ground surface 15 fine silt

Flora—The regional botany is best described in three parts (1) the desert zone north of Khardoum, with a predominants y sandy soil, (2) the intermediate zone between lat 11° and 15° N, of clayey or "cotton" soil masted with grantius sand, and (3) the tropical zone south of lat 11°, where the rainfall is heavy and the soil rich

In the desert zone there is an annual rainfall of four inches or leas, and trees can live only on the rwer banks or in the beds of wadies. The trees found are tamarsk, varieties of accas, heeping (Railantes acpyptiaca, a tail, spany tree guring hard timber and edible fruit), down paims (Hyphaene thebazea) and the date paim. In the Bayuda desert, north of Khartoum, much thorny scrub is found Coarse grasses, able to withstand long periods of drought, grow in the desert area and clothe the uncultivated Nile banks from Dongola to Merowe (Merawi). East of the Nile vegetation is spanse, conssting mainly of scrub, but the wadies contain many varieties of tree. Balin of Cilead (Commiphore opobalsonum) grows on the coast near Suakin.

The great acacia forests are found in the intermediate zone. North of the rath parallel of lattice and west of El Obeld these forests are of stunted trees, useful as fodder for camels. The valuable gum-bearing hashab (Acacia zonegal) grows between lat 12° 45° N. and 44° N. The finest plantations are between lat 10° 45° N. and Bollow trunk is regularly used for water storage acts size; its follow trunk is regularly used for water storage. East of the Nile the vegetation consists meinly of grasses and bush on the Gearia and on the cotton-soil plains and forests on the river banks. Plant growth is more luxuriant near the Abyssinian border In the Gearia, where it is unculviated, and in the Gedari region

the ground is covered with grass and herbage all of which is good fodder. There is much mimosa scrub. The lower reaches of the Blue Nile and its affluents are hordered by dense, thorny jungle Wild cotton and castor-oil plants also grow on their banks.

The tropical zone, south of lat II' N, shows three belts of vegetation distinct one from another forests and parkland in southern Kordofan, savannah with fewer trees in the flood valleys and irrigated lands, and swamp vegetation in the sudd area of the Bahr el-Ghazal and the Bahr el-Jebel In southern Kordofan large acacias flourish and there are some timber trees; in the extieme south of the province many of the large trees found also in the Bahr el-Ghazal forests occur South and west of Wau the forest is dense and widespread, the chief trees there are talk (Acacia scyal), heglig, tamarind and the sausage tree or umm shutur (Kigelia aethiopica) On the rocky upper terraces of the ironstone plateau to the west and southwest there is little thorny undergrowth but many large trees, including the Sudan mahogany (Khaya senegalensis) and scrubby oak (Lephira alala) The rubber vine (Landolphia owariensis) and an inferior variety (L peetersiana) is also found. East of the Nile the forests are far less extensive On the Yei river south of lat 4° N forest is found approaching the equatorial type, with enormous evergreen trees, of which the most important is the giant mahogany. Between lat. 7° N and 10° N, in the swamps of the Bahr el-Jebel and the Bahr el-Ghazal, only marsh vegetation occurs. On the Bahr el-Jebel the dominant plant is the papyrus, often growing to a height of 15 ft or more

Fauna,-There are many species of wild animals and many hundreds of species of birds, resident and migratory The lion. leopard and cheetah are the principal felines. Among the ungulates are the elephant, graffe, zebia, wild ass, thinoceros, buffalo, hippopotamus, ibex, wild sheep and numerous kinds of antelope chimpanzee, baboon, grivet and colobus monkeys are found in the forests. Resident birds include bustards, guinea fowl, several kinds of partridge, geese, cranes, the Egyptian vulture, storks, pelicans, plover, weaverbirds, shrikes and stailings. Thousands of sea birds, waterfowl and other birds winter in the Sudan on their way north. Reptiles include the crocodile and various lizards Snakes are not numerous but there are eight poisonous varieties, Scorpions up to eight inches in length (Pandinus imperator) are found. Insect life is abundant, the vicinity of rivers and swamps is infested with mosquitoes and the seroot flies (large blood-sucking horseflies) are a scourge during the wet months. The tsetse fly, in size and general appearance resembling the house fly, is found south of lat 12° N wherever open water and deep shade provide suitable conditions.

# ARCHAEOLOGY

Only in Nubia, with minor exceptions, had there been any scientific excavations by the 1950s, and many of them had not been fully published. In the rest of the Anglo-Egyptian Sudm archaelogy remained in its infancy. No thorough archaelogical surveys had yet been made, though from surface finds and from the observations of officials and others certain general lines were beginning to emerge. Roads by which foreigness obtained the products of the Sudan (particularly slaves, gold and Ivory) were always of paramount importance; and, especially in the northern Sudan, desiccation and soil erosion have increasingly affected the course of history, particularly during the last 2,000 years

The Eastern Region.—In the upper valley of the nver Atbara fossils and Lower Palaeolithic implements have been found, indicating one route by which the early Stone Age cultures of Egypt and Kenya were connected.

In the desert m the northeastern Sudan gold was extensively mined from ancient Egyptian times down to the 11th century a D Stone-built huts, stone mortars, hammers and circular grinding mills occur with pots at the ancient mines.

The most important route in this area from the earliest historic period has been that which gave access from the Red sea (south of Port Sudan) to the central Sudan by a route which passed north of the Abyssiman massif to the Kassala area. The earliest pottery known in the Sudan, associated in the Khartoum area with barthed

bone spears, has been found as far east as Kassala and as far west as Wadı Howar From Goz Regeb has come evidence of occupation from the protodynastic to the Christian period, and at Sarsareib and in the Kassala area are sites dating back to protodynastic and possibly earlier times In the Red Sea hills there are early occupation sites at Agordat in Eritrea (probably predynastic, C Group and Pan-Grave) and at Erkowit At Aqiq on the Red sea coast are remains which suggest that this was the site of Ptolemais Therion, whence the Ptolemies obtained elephants for their army and which probably continued as a trade centre until the Axumite period. In Roman times trade with India diverted attention from the African mainland, but Merce and Axum became affected by influences from India as a result of the development of that trade, and it was probably trade uvalry that led Axum to destroy a degenerate Meroe c AD 350 Early in the Moslem era Ptolemais was overshadowed by Badı on Aırı Island, where there is a rumed town with cisterns and where Moslem tombstones dating from the 10th and 11th centuries have been found Similar tombstones dating from the 8th to the 10th centuries (the earliest is A H 153=cAD, 700) have been found in Khor Nubt, while early Moslem stone-built towerlike tombs occur at Maman east of Kassala and elsewhere. Circular stone graves with flat tops are probably those of Moslem Beja

The Central Region .- In the Blue Nile valley fossils occur passim below the clay of the Gezira plain, notably at Abu Hugar and Singa, where they include a proto-Bushman skull, contempo-

rary with a crude Levallois culture.

Ancient Egyptian expeditions must have penetrated far south of that part of the Nile valley occupied by them during the New Kingdom. One such expedition to localities previously unidentified is recorded by Amenhotep III, one of whose scarabs was found 100 mi E of Khartoum The Blue Nile valley from Khartoum to Roserres was no doubt always the road to Beni Shangul, whence came slaves and gold Occupation sites occur all the way to Roseires, and no doubt the Napatan, Mercitic, Christian and Fung periods at least are represented In the 6th century AD. Axum was trading with this area directly, bartering gold for iron at Fazughli Finds of Napatan date were made at Sennar and Kosti, while at Jebel Moya Sir Henry Wellcome excavated an occupation site and cemetery showing Negroes in trade connection with Napata Finds of Meroitic date were made in and near Sennar. Rock pictures from this period occur at Tebel Geili east of Khartoum, and the artificial water reservoirs which are common as far south as the Tebel Mova area are probably the work of the kingdom of Meroe A Meroitic ram, brought from Soba to Khartoum by Gen. C. G. Gordon, indicates that Soba was probably a Meroitic town before becoming the capital of the Christian kingdom of Aloa (Alwa). Little now remains on the surface at Soba but red-brick fragments and the stone capitals of a Christian church; Old Nubian inscriptions have been found there in the past. Christian sites were reported from the Blue Nile between Khartoum and Sennar and from Geteina on the White Nile. At Sennar the site of the Fung capital (AD 1500-1821) is being destroyed by the river At Abu Geili near Sennar, a site excavated for Wellcome in 1912, Fung pottery was recognized with considerable probability.

The Southern Region .- South of Kosti occupation sites occur along the bank of the White Nile as far as Malakal. Shards of apparently early date have been found near Malakal, Doleib hill and Jebel Zeraf, and a microlithic culture of Wilton type with pottery on Belli Island. Shards from a pre-Shilluk site near Kaka suggest a connection with Sennar and Meroe. Ancient occupation mounds have been reported from the Bahr el-Ghazal in Aweil district, and polished celts of haematite near Yambio.

This southern region must long have been the goal of traders seeking slaves and ivory, and copper mining probably began at Hofrat en-Nahas at an early date. The Azande show evidence of cultural contact with ancient Egypt, and the Masai and the Kikuyu of East Africa seem to appear more than once, in scenes representing the arrival of the tribute of Cush, in the Tombs of the Nobles at Thehes.

The Western Region.-Here the most important road is that which runs west from the White Nile between the desert and the

tropical forest through Dartur and past Lake Chad to West Africa A few roads running north to south across the desert follow lines of water holes and link this great road with the North African coast In early times the steppe country extended farther north, and finds of protodynastic date come from the southern Libyan desert It may be that Tibesti is the source of the amazon stone and some other cultural features common to the Neolithic of the Fayum and Shahemab From Wadı Howar come remains which suggest that the cattle-owning C Group people, first known to archaeologists in lower Nubia, once lived there. The 6th-dynasty inscriptions of Harkuf at Aswan suggest that the ancient Egyptians used donkey caravans on the Denb el-Arba'ın The earliest traditional rulers of Darfur are the Dagu (otherwise Daju, Tajo, Tago). and some of the brands used till recently by the Dagu sultans of Dar Sila may have a hieroglyphic origin. The extent to which the ancient Egyptians and later the kingdoms of Napata and Meroe controlled the great east-west road was still unknown in the 1050s.

Some form of control over northern Kordofan by the kingdom of Napata was suggested by finds at Abu Sofian and Zankor, although the red-brick ruins there may date from the Meroitic period Merotic "archer's looses" were found in Darfur and at Jebel Haraza That after the fall of Meroe itself the Merotic royal family may have carried on in the west is suggested by an Old Nubian graffito at Audun, a tumulus near Kabona in Jebel Meidob. said to be the grave of a queen who brought the Meidob Kagiddi from the Nile, and by the survival of Kash (Cush), the old name of the kingdoms of Napata and Meroe, in the modern tribal names

Kagıddi, Kaja and (Bırgıd) Kajar.

There are many stone-built ruins in the hills of Darfur. A walled stone town containing two royal residences at Jebel Orrei in northern Darfur may possibly owe its origin to Meroe Circular stone forts and other remains in Turra at the northern end of the Marra massif are traditionally associated with the early Fur sultans Contrary to what has been written, there is no evidence of Darfur's having come within the orbit of Christian Nubia, though rock pictures at Jebel Afarit in Kordofan may be crude copies of Christian saints on horseback as represented in the church of Abd el-Qadır at Wadi Halfa Christian pottery has been found associated with stone cairn graves in the Wadi Mugaddam, and rectangular stone graves in the same area are Christian. Darfur must have come under the influence of the mediaeval kingdom of Kanem-Bornu at various times between the 12th and the 16th centuries, and the red-brick mosques at Ein Fara in northern Darfur probably indicate a Bornu occupation in the 16th century. Stone compounds in the area between Kordofan and Dongola may date from this period Certainly in the 12th century the roads through this area were controlled by Kanem. (See also Egypt. The southern regions of the Anglo-Egyptian Sudan are without recorded history until the era of the Egyptian conquest in the 19th century. In the northern regions, known as Ethiopia or Nubia, Egyptian influence made itself felt as early as the Old Empire. In process of time powerful states grew up with capitals at Napata and Meroe (see section Archaeology above; EGYPT; ETHIOPIA). The Nubians-that is, the dwellers in the Nile valley between Egypt and Ethiopia-did not embrace Christianity until the 6th century, considerably later than their Ethiopian neighbours. The

Arab invasion of North Africa in the 7th century, which turned Egypt into a Mohammedan country, had not the same effect in Nubia, the Moslems, though they frequently raided the country. being unable to hold it. On the ruins of the ancient Ethiopian states arose the Christian kingdoms of Dongola and Aloa, with capitals at Dongola and Soba (corresponding roughly to Napata and Meroe) These kingdoms continued to exist until the middle of the 14th century or later (see Dongola) Meanwhile Arabs of the Beni Omayya tribe, under pressure from the Beni Abbas. had begun to cross the Red sea as early as the 8th century and to settle in the district around Sennar on the Blue Nile, a region which probably marked the southern limits of the kingdom of Aloa The Omayya, who during the following centuries were reinforced by further immigrants from Arabia, intermarried with the Negroid races, and gradually Arab influence became predominant and Islam the nominal faith of all the inhabitants of Sennar In this way a barrier was erected between the Christians of Nubia and those of Abyssinia By the 15th century the Arabized Negro races of the Blue Nile had grown into a powerful nation known as the Fung. and during that century they extended their conquests north to the borders of Egypt The kingdom of Dongola had already been reduced to a condition of anarchy by Moslem invasions from the north Christianity was still professed by some of the Nubians as late as the 16th century, but the whole Sudan north of the lands of the pagan Negroes (roughly 12° N ) was then under Moslem sway. At that time the sultans of Darfur (q,v) in the west and the sultans or kings of Sennar (the Fung rulers) in the east were the most powerful of the Mohammedan potentates

The first of the Fung monarchs acknowledged king of the whole of the allued these, of which the Hameg were next un mportance to the Fung, was Amara Dunkas, who reigned c 1484—1526 During the reign of Adlan, c. 1596—1605, the fame of Sennar attracted learned men to his court from such distant places as Cano and Baghdad Adlan's great-grandson Badi Abu Daku attacked the Shilluk Negross and raided Kordofan. This monarch built the great mosque at Sennar, almost the only buildings in the town to survive the ravease of the deraybase in the 10th century.

In the early part of the r8th centry there was was between the Sennar and the Abyssinans, in which the last-named were defeated with general saughter, a victory over the "nind6sts" which became celebrated throughout the Mohammedan world Toward the end of the 18th century the Hamag wrested power from the Fung and the kingdom fell into decay, many of the tributary princes reliusing to acknowledge the king of Sennar The disorders resulting from this decline continued up to the time of the conquest of the country by the Egyptians.

From the Egyptian Conquest to the Rise of the Mahdi.— The conquest of Nubia was undertaken in 18:0 by order of Mohammed Ai, the pashs of Egypt, and was accomplished in the two years following. His leading motive was, probably, the desire to obtain possession of the mines of gold and prectous stones which he believed the Sudan to contain. Mohammed Ain also wished to crush the remnant of the Mamelukes, who in 18:2 had established themselves at Dongola, and to keep busy the Albanians and Turks in has army, whose fidelity was doubtful.

Mohammed Ali gave the command of the army sent to Nubia to his son Ismail, who at the head of about 4,000 men left Wadi Halfa in Oct 1820. Following the Nile route he occupied Dongola without opposition, the Mamelukes fleeing before him. (Some of them went to Darfur and Wadai, others made their way to the Red sea. This was the final dispersal of the Mamelukes.) With the nomad Shagia, who dominated the district, Ismail had two sharp encounters, one near Korti, the other higher up the river, and in both fights Ismail was successful Thereafter the Shagia furnished useful auxiliary cavalry to the Egyptians. Ismail remained in the Dongola province till Feb. 1821, when he crossed the Bayuda desert and received the submission of the meks (kings) of Berber, Shendi and Halfaya, nominal vassals of the king of Sennar. Continuing his march south, Ismail reached the confluence of the White and Blue Niles and established a camp at Ras Khartoum. (This camp developed into the city of Khartoum.) At this time Badi, the king of Sennar, from whom all real power

had been wrested by his leading councillors, determined to submit to the Egyptians, and as Ismail advanced up the Blue Nile he was met at Wad Medani by Badi, who declared that he recognized Mohammed Alı as master of his kingdom Ismail and Badı entered the town of Sennar together on June 12, 1821, and in this peaceable manner the Egyptians became rulers of the ancient empire of the Fung In search of the gold mines reported to exist faither south. Ismail penetrated into the mountainous region of Fazughli, where the Negroes offered a stout resistance In Feb 1822 Ismail set out on his return to Dongola, having received reports of risings against Egyptian authority. The Egyptian soldiery had behaved with barbarity. Nair Mimi, the mek of Shendi, had been a sort of hostage to Ismail and entertained hatted of the pasha On Ismail's return to Shendi, Oct 1822, he demanded of the mek 1,000 slaves to be supplied in two days The mek, promising compliance, invited Ismail and his chief officers to a feast in his house, around which he had piled heaps of straw. While the Egyptians were feasting the mek set fire to the straw and Ismail and all his companions were burned to death

Ismail's death was speedily avenged. A second Egyptan army, also about 4,000 strong, had followed that of Ismail's up the Nile, and striking southwest from Debba had wrested, after a zharp campaugn, the provance of Kordofan (1821) from the sultan of Darlur. This army was commanded by Mohammed Bey, the defterdar, son-in-law of Mohammed Ah. Hearing of Ismail's murder the defterdar marched to Shend, defeated the forces of the mek and took terrible revenge upon the inhabitants of Metama and Shendi, most of the inhabitants, including women and children, being burned alive. Nair Mirnt escaped to the Abyssiman frontier, where he maintained his indeendence.

Character of Expytian Rule.—Having conquered Nubia, Senar and Kordofian the Egyptians set up a civil government, placing at the head of the administration a governor general with practically unlimited power. Khurshid Pasha (governor general 1856-30) gained a great reputation both for rectified and vigour. About this period Mohammed Ali leased from the sulfan of Turkey the Red sea ports of Suakin and Massawa and thus got into his hands the trade routes of the eastern Sudan. The pasha of Egypt practically monopolized the trade of the country except that in slaves, for which border lands were raded annually. From the Negro population the army was so largely recruited that in a few years the only non-Sudanese in it were officers. The Egyptian rule proved harmful to the country. The governors general and the leading officials were nearly all Turks, Albanians or Circasians, and, with rare exceptions, the welfare of the various peoples of the Sudan formed no part of their conception of government.

Numerous eftorts were made to extend the authority of Egypt. In 1840 the fettle district of Taka, watered by the Athara and Gash and near the Abysanian frontier, was conquered and the town of Kassala founded In 1837 the pasha himself had visited the Sudan, going as far as Fazughli, where he inspected the gold fadds.

The successors of Mohammed Ali, in an endeavour to make the country more profitable, extended their conquests to the south, and in 1853 and subsequent years trading posts were established on the upper Nile. The government monopoly in trade had ceased in 1849 on the death of Mohammed Ali, The proneer European merchant was John Petherick, British consular agent at Khartoum, Petherick sought, for ivory only, but those who followed him soon found that slave raiding was more profitable than elephant hunting. The viceroy Said, who made a rapid tour through the Sudan in 1857, found it in a deplorable condition. The viceroy ordered many reforms to be executed and proclaimed the abolition of slavery. The reforms were mainly inoperative and slavery continued The European merchants above Khartoum had sold their posts to Arab agents, who oppressed the natives in every conceivable fashion Ismail Pasha, who became viceroy of Egypt in 1863, again gave orders for the suppression of the slave trade, and to check the operations of the Arab traders a military force was stationed at Fashoda (1865), this being the most southerly point then held by the Egyptians.

Ismail, however, was ambitious to extend his dominions and to

develop the Sudan on the lines conceived by him for the development of Egypt He obtained (1865) from the sultan of Turkey a firman assigning to him the administration of Suakin and Massawa, the lease which Mohammed Ali had of these ports having lapsed after the death of that pasha Ismail subsequently (1870-75) extended his sway over the whole coast from Suez to Cape Guardafus, but on the rise of the mahdi (see below) Egyptian authority was withdrawn (1884) from the coast regions south of

Suakin. Baker and Gordon.-At the same time that Ismail annexed the seaboard he was extending his sway along the Nile valley to the equatorial lakes and conceived the idea of annexing all the country between the Nile and the Indian ocean An expedition was sent (1875) to the Juba river with that object, but it was withdrawn at the request of the British government, as it infringed the rights of the sultan of Zanzibar Meanwhile, on the main Nile, control of all territories south of Gondokoro had been given to Sir Samuel Baker, who, reaching Gondokoro on May 26, 1870, formally annexed that station, which he named Ismailia, to the khedivial domains Baker remained as governor of the Equatorial provinces until Aug 1873, and in March 1874 Col C G Gordon took up the same post. Both Baker and Gordon made strenuous efforts toward crushing the slave trade, but their endeavours were largely thwarted by the maction of the authorities at Khartoum. Under Gordon the upper Nile region as far as the borders of Uganda came more or less effectively under Egyptian control On the west the Bahr el-Ghazal had been overrun by Arab or semi-Arab slave dealers who reduced that region to a state of abject misery The most powerful of the slave traders was Zobeir Rahama Pasha (q.v), who, having defeated a force sent from Khartoum to reduce him to obedience, invaded Darfur (1874). The khedive, fearing the power of Zobeir, also sent an expedition to Darfur, and that country, after a stout resistance, was conguered Zobeir claimed to be made governor general of the new province; his request being refused, he went to Cairo to urge his claim At Cairo he was detained by the Egyptian authorities

Though spasmodic efforts were made to promote agriculture and open up communications, the Sudan continued to be a constant drain on the Egyptian exchequer. A project to link Wadi Halfa to Khartoum by railway was abandoned (1877) after 50 mi. of rails had been laid in five or six years at a cost of £450,000. In Oct. 1876 Gordon left the Equatorial provinces and gave up his appointment. In Feb. 1877, under pressure from the British and Egyptian governments, he went to Cairo, where he was given the governorship of the whole of the Egyptian territories outside Egypt namely, the Sudan provinces proper, the Equatorial provinces, Darfur and the Red sea and Somali coasts. Gordon remained in the Sudan until Aug. 1879. During his tenure of office he did much to give the Sudanese the benefit of a just and considerate government. He pacified Darfur and then received the submission of Suliman Zobeir (son of Zobeir Pasha), who was at the head of a gang of slave traders in the Bahr el-Ghazal In 1878 there was further trouble in Darfur and also in Kordofan, and Gordon visited both these provinces, breaking up many companies of slave hunters. Meantime Suliman (acting on the instructions of his father, who was still at Cairo) had broken out. into open revolt against the Egyptians in the Bahr el-Ghazal. The crushing of Suhman was entrusted by Gordon to Romolo Gessi (1831-81), an Italian who had previously served under Gordon on the upper Nile, Gessi, after a most arduous campaign (1878-79), defeated and captured Suliman, whom, with other ringleaders, he executed. The slave raiders were completely broken up and more than 10,000 captives released. A remnant of Zobeir's troops under a chief named Rabah succeeded in escaping (see RABAH ZOBEIR). Having conquered the province. Gessi was made governor of the Bahr el-Ghazal, becoming pasha.

When Gordon left the Sudan he was succeeded at Khartoum by Raouf Pasha, under whom the old abuses of the Egyptian administration were revived. At this time the high European officials in the Sudan, besides Gessi, included Emin Pasha (q.v.), governor of the Equatorial province since 1878, and Slatin Pasha (see SLATIN, SIR RUDOLF CARL VON), governor of Darfur. Gessi found

his position under Raouf intolerable, resigned his post in Sept 1880 and was succeeded by Frank Lupton, an Englishman and formerly captain of a Red sea merchant steamer. At this period (1880-82) schemes for the reorganization and better administration of the Sudan were elaborated on paper, but the revolt in Egypt under Arabi (see Egpyr History) and the appearance of a madhi intervened

The Rise and Power of Mahdism.-Venality and the extortion of the tax gatherer flourished anew after the departure of Gordon, while the feebleness of his successors inspired in the Baggara a contempt for the authority which prohibited their pursuing their most lucrative traffic. When Mohammed Ahmed (q v ), a Dongolese, proclaimed himself the long-looked-for mahdi (guide) of Islam, he found most of his original followers among the grossly superstitious villagers of Kordofan, to whom he preached universal equality and a community of goods, while denouncing the "Turks"-at that time the Sudanese called all foreigners Turks-as unworthy Moslems on whom God would execute judgment The Baggara perceived in this mahdi one who could be used to shake off Egyptian rule The new mahdi married the daughters of their sheikhs and found in Abdullah, a member of the Ta'Aisha section of the tribe, whom he appointed khalifa (lieutenant), his chief supporter

The mahdi's capture of El Obeid on Jan 17, 1883, and the annihilation in the next November of an army of more than 10,-000 men commanded by Hicks Pasha (Col William Hicks [q v]. formerly of the Bombay army) made the mahdi undisputed master of Kordofan and Sennar The next month, Dec 1883, saw the surrender of Slatin in Darfur, while in Feb. 1884 Osman Digna. his amir in the Red sea regions, inflicted a crushing defeat on about 4,000 Egyptians at El Teb near Suakin In April following Lupton Bey, governor of Bahr el-Ghazal, was sent captive to

Omdurman, where he died on May 8, 1888

Gordon at Khartoum.-On learning of the disaster to Hicks Pasha's army, the British government (Great Britain having been since 1882 in military occupation of Egypt) insisted that the Egyptian government should evacuate such parts of the Sudan as they still held, and General Gordon was dispatched, with Lieut Col. Donald H Stewart, to Khartoum to arrange the withdrawal of the Egyptian civil and military population. Gordon's instructions, based largely on his own suggestions, were not wholly consistent; they contemplated vaguely the establishment of some form of stable government on the surrender of Egyptian authority, and among the documents with which he was furnished was a filman creating him governor general of the Sudan. Gordon reached Khartoum on Feb 18, 1884, and at first his mission, which had aroused great enthusiasm in England, promised success To smooth the way for the retreat of the Egyptian garrisons and civilians he issued proclamations announcing that the suppression of the slave trade was abandoned, that the mahdi was sultan of Kordofan and that the Sudan was independent of Egypt He enabled several thousand refugees to make their escape to Aswan and collected at Khartoum troops from some of the outlying sta-

By this time the situation had altered for the worse, and mahdism was gaining strength among tribes in the Nile valley at first hostile to its propaganda. Gordon telegraphed to Cairo asking that Zobeir Pasha might be sent to him, his intention being to hand to Zobeir the government. Zobeir, a Sudanese Arab, was probably the one man who could have withstood successfully the mahdi. Because of Zobeir's notoriety as a slave raider, Gordon's request was refused. All hope of a peaceful retreat of the Egyptians was thus rendered impossible.

The mahdist movement now swept northward, and on May 20 Berber was captured by the dervishes and Khartoum isolated. From this time the energies of Gordon were devoted to the defense of that town After delay, an expedition was sent up the Nile under the command of Lord Wolseley. It started too late to achieve its object, and on Jan 26, 1885, Khartoum was captured by the mahdi and Gordon killed Colonel Stewart, Frank Power (British consul at Khartoum) and Herbin (French consul), who (accompanied by 19 Greeks) had been sent down the Nile by Gordon in the previous September to give news to the relief force, had been decoyed ashore and murdered (Sept. 18, 1884) The fall of Khartoum was followed by the withdrawl of the British expedition, Dongola being evacuated in June 1885 In the same month Kassala capitulated, but just as the mahil had practically completed the destruction of the Egyptian power he

the Khalifa's Rule—The mahdi was at once succeeded by the khalifa Abdullah, wose rule continued until Sept 2, 1898, this period in the history of the Sudan being known as the Mahdio On the date named the khalifa's army was completely overthrown by an Anglo-Egyptian force under Sir Horatio Herbert (afterward Lord) Kitchener. (See EGVPT AND SUDAN CAMPAGINS [1882-1800]

The mahdi had been regarded by his fanatical adherents as the only true commander of the faithful, endued with divine power to conquer the whole world He had at first styled his followers dervishes (i.e., religious mendicants) and given them the iibbah as their characteristic garment or uniform Later on he commanded the faithful to call themselves ansar (helpers), and at the time of his death he was planning an invasion of Egypt. He had liberated the Sudanese from the extortions of the Egyptians, but the people soon found that the mahdi's rule was even more oppressive Gradually all chiefs and amirs not of the Baggara tribe were got rid of except Osman Digna, whose sphere of operations was on the Red sea coast. Abdullah's rule produced complete agricultural and commercial ruin. He was also almost constantly in conflict either with the Shilluks, Nuers and other Negro tribes of the south, with the peoples of Darfur, where at one time an antimahdi gained a great following; with the Abyssinians, with the Kahabish and other Arabic-speaking tribes who had never embraced mahdism, or with the Italians, Egyptians and British Notwithstanding all this opposition, the khalifa found in his own tribesmen and in his black troops devoted adherents, and he successfully defended his position. The attempt to conquer Egypt ended in the total defeat of the dervish army at Toski (Aug. 3, 1889) The attempts to subdue the Equatorial provinces were but partly successful. Emin Pasha, to whose relief H M. Stanley had gone, evacuated Wadelai in April 1889. The greater part of the region and also most of the Bahr el-Ghazal relapsed into a state of chaos.

Pligrimages to the maldi's tomb at Omdurman were substituted for pilgrimages to Mecca The arenal and dockyard and the printing press at Khaitoum were kept busy (the workmen being Egyptians who had escaped massacre). Otherwise Khaitoum was deserted, the khaifa making Omdurman his capital. The population of the country dwindled from warfare and disease, smallpox being endemic.

The European captives were kept prisoners at Omdurman Besides former officials like Slatin and Lupton, they included several Roman Cathohe priests and sisters and numbers of Greek merchants established at Khartoum. Although several were closely imprisoned, loaded with chans and repeatedly fogged, at 1s a notworthy fact that none was put to death. From time to time a prisoner, among them Slatin, made his sesape.

The khalifa, when defeated, fled to Kordofan where he was killed in battle in Nov. 1899 In Jan. 1900 Osman Digna, a fugitive, was captured. As in 1903 and 1908, other mahdis arose, but they were captured and hanged.

The Anglo-Egyptian Condominium—Of the causes which led to the reconquest of the Sudan the most weighty was the necessity of securing control of the upper Nile, Egypt being wholly dependent on the waters of the never for its prospenty. France was endeavouring to establish its authority on the river between Khartoum and Gondokor, as Jean Baptiste Marchand's expedition from the Congo to Fashoda (see AFRICA: History) demonstrated.

The Sudan having been reconquered by "the joint military and financial efforts" of Great Britain and Egypt, the British government claimed "by right of conquest" to share in the settlement of the administration and legislation of the country. To meet these claims an agreement between Great Britain and Egypt was

squed on Jan 19, 1890, establishing the joint sovereignty of the two states throughout the Sudan and defining its northern fronter as lyng along the 2 and parallel of lattude north. The reorganration of the country had already begun, supreme power beaucentred in an official termed the governor general of the Sudan, who by the terms of the agreement was appointed on the recommendation of the British government. Thus in effect Great Buttan controlled the Sudan

Lord Kitchener, the sirdar (commander in chief) of the Egyptian army, under whom the Sudan had been reconquered, was the first governor general On Kitchener's departure to South Africa, at the close of 1800, he was succeeded as sirdar and governor general by Maj Gen Sn Regnald Wingate, who had served with the Egyptian army since 1883 Wingate remained as governor general and sirdar until Dec 1916, when he was appointed high com-missioner for Egypt. With Wingate served Slatin Pasha as inspector general, his knowledge of native affairs being most valuable. But Slatin was an Austrian, and on the outbreak of World War I his services were lost to the Sudan Under a just and firm administration, which from the first was essentially civil, though the principal officials were officers of the British army. the Sudan recovered in a surprising manner from the woes it suffered during the Mahdia At the head of every mudiria (province) was placed a British official, though many of the subordinate posts were filled by Egyptians An exception was made in the case of Darfur, which, before the battle of Omdurman, had thrown off the khalifa's rule and was again under a native sovereign. This potentate, the sultan Ali Dinar, was recognized by the Sudan government, on condition of the payment of an annual tribute During World War I Ali Dinar revolted, an expedition under Lieut Col. P V Kelly inflicted a crushing defeat on the Darfurians outside the capital, El Fasher, on May 22, 1916 The sultan fled and was killed in action in the following November Darfur had meanwhile been incorporated as a province in the

The first duty of the new administration, the restoration of public order, net with comparatively feelbe opposition, though tribes such as the Nuba mountainers, accustomed from time immorial to raid their weaker neighbours, gave some trouble. The delimitation (1903-04) of the frontier between the Sudan and Abyssima helped in the restoration of order in a patificiality less region, but occasional raids by Abyssimans across the border for slaves were to be incorred as late as 1904.

With good administration and public security the population increased steadily. The Sudan government devoted much attention to the revival of agriculture and commerce, to the creation of an educated class of natives and to the establishment of an adequate judicial system It was made easier by the decision to govern, as far as possible, in accordance with native law and custom, no attempt being made to Egyptianize or Anglicize the The Arab-speaking and Mohammedan population Sudanese. found its religion and language respected and showed a marked desire to profit by the new order. To the Negroes of the southern Sudan, who were exceedingly suspicious of all strangerswhom hitherto they had known almost exclusively as slave raiders the very elements of civilization had, in most cases, to be taught. In these pagan regions the Sudan government encouraged the work of missionary societies, both Protestant and Roman Catholic. while discouraging propaganda work among the Moslems

Basis of Prosperity—In its general policy the Sudan government adopted a system of light taxation Prosperity was largely the result. A short route to the sea being essential, a railway from the Nile near Berber to the Red sea was bull (1904–60). It shortened the distance from Khattoum to the coast by nearly 1,000 ml. Sir Eldon Gorst (high commissioner in Egypt) after a tour of inspection declared in his report to 1909, "It do not suppose that there is any part of the world in which the mass of the population have fewer unsatisfied wants."

The next development came out of the search for new cotton fields by the British Cotton Growing association Experiments had been made in 1911 as, to whether long-staple cotton could profitably be grown in the Gezira (the "island" between the

White and Blue Niles immediately above Khartoum) At that time a railway was being built from Khartoum along the edge of the Gezira to Sennar and thence to Kordofan This railway was opened in 1912, it brought the Gezira within easy reach of Khartoum, besides rendering more easily accessible the rich gum and cattle areas of Kordofan In the same year the Cotton Growing association experts who had visited the Sudan reported enthusiastically upon its cotton-growing possibilities, with the result that in 1913 the British parliament guaranteed a loan of £3,000,000 for irrigation and railway schemes Just at this time (1913-14) the value of any project which would give to large areas adequate water supplies by means of artificial irrigation received a striking demonstration. The 1913 rains were very bad and the river flood was the lowest recorded for more than a century, so that all over the northern Sudan, and particularly in the Gezira area, famine conditions prevailed during the following winter. The situation was saved by the government's importing of grain from India. and it is probable that this contributed more than any other factor to the quiet in the Sudan during World War I. (F. R C)

Politics and Development After 1914.-World War I had little effect upon the Sudan But the agitations which were so widespread a feature of its aftermath did not leave the country unaffected Egyptian nationalism was always acutely sensitive about the Sudan Its greatest exponent-Saad Zaghlul-regarded the country as having been legally and permanently acquired by Egypt in the time of Mohammed Alı and spoke of its having been "stolen" by Great Britain, Such a claim made compromise difficult, and when it was met by a British policy based on the concept of trusteeship for ultimate Sudanese self-government, it was, later in the century, to make the Sudanese question the most difficult obstacle to Anglo-Egyptian settlement

After the end of World War I, under the governorship of Sir Lee Stack, the administration followed a policy which was summarized by the Milner commission in 1920 as one of "decentralisation and the employment wherever possible of native agencies for the simple administrative needs of the country," There was an orderly political evolution in the Sudan, although this was interrupted by certain reactions to political disturbances in Egypt When, in Feb. 1922, Egypt was declared independent, provision was made for the maintenance of the status quo in the Sudan, but Egyptian nationalist claims led to the formation of a dissident group under the name of the White Flag league. Cucumstances were complicated by the presence of Egyptian forces in the Sudan. and in Aug 1924 there were a number of local mutinies. The British position was firmly maintained during J Ramsay MacDonald's negotiations with Zaghlul Pasha in the autumn of 1924, and it was perhaps Egyptian nationalist disappointment at this which led to the shooting of Sir Lee Stack on Nov 19, 1924, in the streets of Cairo. This act drew an ultimatum from the British government, which demanded, among other things, the immediate withdrawal of all Egyptian troops and officers from the Sudan When this demand was refused, orders were issued for their expulsion. There were at first difficulties about putting this into effect, and a number of Sudanese detachments in Khartoum mutimed on Nov. 27. Order was restored two days later, and the evacuation was completed. It was followed by the creation of a Sudan defense force. The governor general of the Sudan now ceased to be sirdar of the Egyptian army.

There followed a period of slow but orderly progress in the

affairs of the country. During the term of office as governor general of Sir Geoffrey Archer (appointed Jan. 25, 1925) the process of decentralization was speeded up, and it was continued, after Sir Geoffrey's resignation in 1926, by his successor, Sir John Maffey. One measure (the Powers of the Sheikhs ordinance) in 1927 considerably strengthened the authority of the chiefs over their tribes. In Jan 1926 the Sennar dam was opened and a great part of the Gezira thereby brought under irrigation. Meanwhile, the development of motor transport opened up markets and led to an increase of cultivation and a steady growth of gen-

eral prosperity.

No change in the status of the Sudan was contemplated by the British government in negotiating the draft of a new treaty, which was rejected by the Egyptian cabinet in March 1928. But the mutual need of the two countries was emphasized, in May 1929, by the terms of a comprehensive agreement regarding the development of the Nile for irrigation purposes

During World War II the Sudan took an active part, in recognition of which the United Kingdom government subsequently made a free grant of £2,000,000 to it The entry of Italy into the war in 1940 gave the Sudan a hostile frontier in Eritrea and Abyssinia The defense force was quickly raised by voluntary enlistment from a rifle strength of 4,000 in 1939 to 30,000. Large detachments of this force played an important part in the defense of the territory against the Italians, then in the conquest of Entrea and Abyssinia and subsequently in the campaign in Libya

Once more war brought an increased interest in politics, and this time the administration embarked upon a firm policy with Sudanese self-government as its fairly near objective Steady progress in education had already increased the number of those Sudanese likely to be politically conscious It was estimated in 1934 that these numbered about 12,000; but a considerable increase in educational activities after that time added many more to their numbers Most of them, however, were still town dwellers or in the government service Literacy was, as elsewhere, followed by a growth of the influence of newspapers These contributed much to the acceptance of the concept of the Sudan as a national unit. Broadcasting, too, was influential it tended to awaken political interest even among the illiterate inhabitants of the "black south." Perhaps the most influential organizations in the country were the religious fraternities known as tariqus approach of self-government led the most important of these farther along political paths The mahdists, under the leader-ship of Sir Abd ur-Rahman el-Mahdi, strongly opposed the Egyptian thesis of the unity of the Nile valley, and there were signs that their chief rivals, the Mirghamya, and their leader, Sir Alı el-Mirghani, might be influenced by their rivalry to take a different side in politics

The beginning of negotiations for a new Anglo-Egyptian treaty in 1946 made an acute issue of the future of the Sudan, and this was immediately reflected among the Sudanese Educated opin-10n had for several years been largely moulded in the so-called Sudan Graduates congress, a body composed of most schooleducated Sudanese It was not until after 1945, when Gordon college first received university status, that the country produced graduates in the European sense The congress sent a delegation to join the negotiations in Cairo, but this was refused recognition, and its members lost their unity and gave rise by their divisions to the two main political parties, the Ashigga and the Umma, or

National Front and Independence Front.

The Ashigga, in general, took the Egyptian view, although they chose to interpret this as implying for the Sudan some sort of dominion status under the Egyptian crown. The Umma stood for the speedy achievement of complete self-government and subsequent negotiations with Egypt and with Great Britain They were, however, uncompromisingly opposed to Egyptian sovereignty in any form. The Anglo-Egyptian negotiators found the future of the Sudan their most intractable problem and the talks broke down when, after an apparent misunderstanding, the British prime minister, Clement Attlee, stated on Oct. 28, 1947, that "No change in the existing status and administration of the Sudan is contemplated and no impairment of the right of the Sudanese people ultimately to decide their own future

The new Egyptian government under Nokrashy Pasha maintained its point of view and referred the matter to the Security council of the United Nations in a letter dated July 8, 1947. After discussion, the matter was allowed to remain upon the agenda, an outcome which was regarded by Egyptians as a rebuff In June 1948 the British government announced a comprehensive scheme of constitutional reforms involving the election on Nov. 16 of a legislative assembly, which met eight days before the end of the year. Mohammed Saleh Shengeiti, a former judge of the Sudan high court, was appointed speaker An important group boycotted the elections, but the house was probably a fairly representative one. The Umma was strong in the assembly, which elected as its

president Miralai Abdullah Bey Khalil, the secretary-general of Sudan's right to self-determination. In Feb 1953, after concesthat party A third group, the Black Bloc, claimed to represent the comparatively few literate Sudanese who originated in the southern Sudan On Feb 17, 1949, Sir James Robertson, the senior executive member, announced the government's policy this was to encourage the achievement of full self-government before a decision should be made about relations with the joint sovereigns or about the eventual constitution of the Sudanese state. There was also to be an active policy of social welfare within the limits of sound finance, and a ten-year educational program was announced. In 1950 the treasurer of the English city of Coventry, A H Marshall, who had in 1949 been asked to report on the development of local government, made proposals for drastic changes in policy, involving the creation of single local authorities for all purposes, financially independent and answer-able to the local electors These were accepted in principle by the legislative assembly, which thereby approved what amounted to the replacement of an Egyptian (and originally French) system by an English one National feeling showed itself in debates on the defense force, although it was shown that Sudanization had so far progressed that there were only 40 British officers in 1950 as against 69 in 1939 In Dec 1950 considerable excitement was occasioned by a debate in the legislative assembly on a motion in favour of immediate independence, which was defeated by one vote; but on Dec 15 there was a majority of 391 to 38 in favour of asking Great Britain and Egypt for self-government in 1951.

A potentially serious source of Sudanese disunity was the difference between the Moslem, Arabic-speaking north and the still largely pagan, Negro south Christian European missionaries were active in the south, and this led to assertions that Islam and Arabic were being handicapped. The minister of education announced that 18 northern officials were to be sent to speed up the extension of Arabic to the south, while southern requests for English programs from the Omdurman radio station were refused The Gezira scheme was nationalized in June 1950 and the Sudan Plantations syndicate wound up It was moreover stated that the department of education planned to extend elementary education to cover two-fifths of the children of school age in the northern Sudan within the next decade, a plan that would involve doubling the number of elementary schools in that area There were signs of the spread to the Sudan of the practice of student strikes familiar in Egypt and elsewhere A three-day strike involving 100,000 workers in April 1051 and a transport workers' strike that disrupted life in Khartoum for five days in May were followed by the more serious police strike in June, which led to the declaration of a state of emergency (June 13)

The future of the Sudan was naturally a major point of issue when Anglo-Egyptian relations deteriorated in the autumn of 1951. The unilateral abrogation by Egypt of the treaty of 1936 was matched by legislation denouncing the condominum and pro-claiming the Egyptian monarch to be "king of the Sudan" The British stood by their former attitude; but the Sudanese themselves were clearly no longer the passive objects of the dispute, and there was increasing evidence of a new national awareness and of an independent body of Sudanese opinion. Political development was apparent in the rapid growth of labour organizations, this was attended by strikes, which appeared at times to have little substantial purpose. National feeling, moreover, expressed itself strongly in reaction to certain Egyptian claims that seemed to show an almost proprietary attitude to the Sudan. With the growth of a desire of self-government Egyptian influence lost ground,

The Cairo coup d'état of July 1952, which gave power to Gen Mohammed Naguib, himself partly Sudanese by origin, marked the beginning of a new chapter in the affairs of the Sudan The irresponsible expression of feeling in Egypt was now more effectively restrained. The British government grew increasingly concerned for the fate of the largely non-Moslem peoples of the southern Sudan, but cautious Anglo-Egyptian negotiations made steady progress, especially after General Naguib had, on Nov. 2, 1952, made a momentous and politically courageous declaration abandoning Egypt's claim to sole sovereignty and recognizing the

sions by both sides, came an agreement, the first real Anglo-Egyptian agreement on the Sudan for more than 50 years it provided for Sudanese self-government within three years and for the partial supervision of the process of change by an international commission

#### POPULATION

The population, which before the mahdist revolt was estimated at 8,500,000, was reduced by famine, disease, battle and internecine strife to about 1,250,000 between 1882 and 1898. After that date recovery was rapid, and the approximate figure in 1951 was 8,740,000

The northern provinces are predominantly Moslem and Arabicspeaking. Though commonly called Arabs (q v ), the people are of very mixed origin-Arab and Hamite, Hamite and Negro and above all, Arab and Negro-and the name "Arab" covers many stocks in which the actual infusion of Arab blood may be very slight indeed The most convenient classification of these tribes is into (1) camel-breeding nomads, (2) cattle folk (Baggara or Bakkara) and (3) sedentaries. These classes are not mutually exclusive: some tribes include all three, some are both nomad and sedentary. The sedentaries of the Wach Halfa district and in Dongola as far south as Debba are Nubians who have kept their own language (though most of the men speak Arabic also) and are therefore known to the Arabic speakers of Egypt and the Sudan as Barabra (q.v.) or Berberines. Baggara (cattle folk) is a generic, not a tribal, name and is applied to the people who occupy the comparatively well-watered plains of southern Kordofan and Darfur between lat. 13° N. and the Bahr el-Arab. They are nomadic within the limits required by seasonal changes, pasturage and the need for water. Their contact with other Arabs is slight, and they have a closer connection with the Negroes of the south, They speak a distinctive dialect of Arabic.

Ranging across the northeastern quadrant of the country are the Hamitic Beja tribes (see BEJA). These comprise the Bishatin in the Red Sea hills; the Amarar from Musmar to Port Sudan; the Hadendoa, the largest and best-known tribe, whose territory stretches as far south as Tokar; and the Beni Amer, who lie to the east between Tokar and Kassala.

The Nuba (q.v.), who inhabit the plain and the ranges of rugged hills south of El Obeid, have racial characteristics quite distinct from those of the "Nubians" of the north They speak a remarkable multiplicity of languages. They are good cultivators and possess few cattle.

The main interest of the other important pagan tribes of the south lies in their cattle. In tribal organization, in customs and in language each of the main groups is distinct. The Shilluk are found in the plains south of the Nuba mountains; the Dinka, from the Bahr el-Arab across the Bahr el-Ghazal to the Zeraf and east of the White Nile below Malakal; the Nuer, south of Malakal on the Sobat river; the Anuak, on the Pibor river, the Bari, on both sides of the river round Rejaf; and the Azande, on the iron-

stone plateau in the southwest

Social Conditions—It is impossible to generalize in any description of the social conditions of the melley of tribes which occupy this vast country, with its many variations of soil, climate and vegetation and, in the south, its multiplicity of religious beliefs and languages. In the north the Arabic language and the religion of Islam (which, in primitive communities, still rules the everyday life of the people) provide a common basis and give unity of social and political ideas. But superficially a great diversity in the way of life is found, the traditional cleavage between the desert and the sown states. Anthone of Negrods of the north and the nated, black-skinned peoples of the southern provinces, where customs, beliefs and material culture vary from tribe to tribe and there is no political cohesion, no sense of tribal loyalty and, evcept among the Shilluk, no trabal organization.

## GOVERNMENT AND ADMINISTRATION

The head of the government is the governor general, who is appointed by Egypt on the recommendation of the British government under the terms of the agreements of 1899 known as the Condominium agreements. An advisory council for the northern Sudan was established in 1944 as a step toward a closer association of the Sudanese public with government policy. In 1946 an Anglo-Sudanese committee recommended the setting up of a legislative assembly to carry this policy further and to bring in representatives of the more backward southern provinces recommendations were forwarded to the condominium government and modified to meet Egyptian criticism of them, but, even then, the Egyptian government withheld its approval. In 1948, however, the governor general promulgated an ordinance estab lishing an executive council with seven Sudanese and five British members and a legislative assembly with 65 elected, a maximum of 10 nominated and some ex officio members. The legislative assembly met for the first time on Dec 15, 1948. After being passed by the council and the assembly a bill becomes law on its obtaining the assent of the governor general In 1951 the governor general set up a committee to work out a constitution for the Sudan.

Administrative Divisions.—There are nine provinces under provincial governors, comprising 46 districts The provinces (with their capitals) are Bahr el-Ghazal (Wau), Blue Nile (Wad Medam), Darfur (El Fasher), Equatoria (Juba), Kassala (Kassala), Khartoum (Khartoum), Kordofan (El Obeid), Northern (El Damer), Upper Nile (Malakal) The head of the provincial administration is the civil secretary, but the governors of provinces are the chief magistrates and have considerable freedom of action The district commissioners under the provincial governors exercise functions which vary according to the state of advancement of the region. A majority of the most senior posts was still in Butish hands in the early 1950s but the policy of Sudanization had made rapid progress In each province there is a provincial council of 12 to 20 Sudanese members who advise the governor. Local government was gradually extended from 1921 In 1952 there were 17 urban boroughs and 39 rural districts, which had their own budgets.

"Development of the control of the control of the control of the control of appeal, and by subordinate district judges. The high court, who are also members of the court of appeal, and by subordinate district judges. There is a substantial body of legislation covering various branches of civil law. Ceminal justice is administered under the Sudan penal code, which was mustituted on the model of the Indian penal code. Serious crimes are tried by major courts constituted under the code of criminal procedure and composed of a president and two members. There are in addition Sharia (Moslem religious) courts for questions relating to the personal status of Moslems (marriage, divorce, nehertiance and so forth), with a high court (mahkomah) at Khartoum over which the grant cadt presides.

Labour laws are based on British models There were in 1952 about 100 trade unions, the largest being the Sudan Railway Workers' union, with 19,000 members

Defense.-The Sudan defense force, formed in 1925 on the

withdrawal of Egyptian army units, had in 1940 a 1fle stiength of 4,000, officiend by 69 Birthis and 97 Sudanese officers. It was greatly expanded during World War II but was much reduced in numbers after 1945. In 1952 it comprised a camel corps, the eastern Arab corps, the western Arab corps and the equatorial copps, as well as technical and service units based in Khartoum The police force establishment at the end of 1949 was 100 officers and 6,409 men.

Public Health and Education.—Great progress was made during the first half of the 20th century in winning the confidence of the people and in building up an efficient medical service. By 1952 there was a network of 40 hospitals and more than 400 rural dispensaries in the charge of medical assistants trained in the diagnosis of the commoner endemic diseases and competent to satired to the network of the commoner endemic diseases and competent to

attend to the victims of accident or sudden illness The system of education falls into two spheres the northern. which is mainly in direct government hands, and the southern, where Christian missions are the main agents of government in the spread of education The department of education became a ministry at the end of 1948, when the first minister was appointed Higher education is provided by the Gordon Memorial college in Khartoum (founded as a primary school by British public subscription in 1902), which in 1951 was embodied, with the Kitchener School of Medicine, as the University College of Khartoum It has faculties of arts, law, science, engineering, agriculture and veterinary science and had 440 students (including 46 medical students) in 1951 It is in special relationship with London university, whose degrees may be taken from Khartoum In 1800 no more than 300 boys were attending schools in the Sudan, at the beginning of 1950 the number of schools was 1,475 and the number of pupils 137,577 (118,448 boys and 19,129 girls).

#### ECONOMY

Agriculture and Forestry.—Cotton is by far the most important crop from the economic point of view, both long- and short-staple varieties are grown, the former in areas under special irrigation schemes and the latter in areas of rain cultivation Durra (sorghum millets), the main food crop, and dukhn (Penmesteim millets) are widely grown in all districts. When it grown as a cash crop on trigated land to meet the need of the towns Some barley is grown in the Northern province and miscies extensively grown there and on the upper Blue Nile and miscincer of vegetable oil. Peanuts are grown for use as a foodstuff, not for extractive purposes.

The natural grazing is supplemented by grain residuals and ceitain fodder crops, of which lubia (Dolkchos lablab) is the most widely cultivated. Barsim (alfalfa) also finds a place where adequate moisture can be assured throughout the year

The date palm is an important item in the economy of the riverain cultivator between Kharloum and the Egyptian frontier Citrus fruits and mangoes are becoming more popular crops, and bananas, indigenous in the southern provunces, are being grown commercially in Kassala Market gardening is steadily increasing, bamia (lady's-finger), omous and other vegetables, both tropical and European, are grown but demand still exceeds supply Tobacco, coffee and sugar cane are grown in the south but had not become economically important by mid-2oth century

In the 1950s plans for the agricultural development of the rainland of the south were not fully realized, and the prosperity of Sudanese agriculture still depended on irrigation (under various systems of control) and perennial irrigation (under various systems of control) and perennial irrigation (by lift or gravity flow) were employed. Primitive water this and power-driven pumps were used. The only gravity-flow irrigation was in the Gezira scheme fed from the Senara dam. The Gezira is a flat plane attending from the junction of the Blue and White Niles to a line 120 mi. S. and comprising about 5,000,000 ac, with 3,000,000 ac irrigable. The scheme was in the hands of a syndicate from its imagumation in 1911 until the government took it over in 1950. Here, too, cotton is the main crop; durra, lubic and fodder crops also have their place in the system of crop rotation.

The Sudan and Senegal are the two great gum-producing counters of the world, and in the Anglo-Ego plants Sudar gum arabet from the acacus of Kordofan is the most important forcest product. The felling of timber for fuel is controlled, so as to preserve easiting forests and to concentrate fellings in forest reserves when reafforestation can be assured.

Minerals.—The Sudan is poor in minerals. Gold as found in the mountains of the Red sea coast, but the formation of the reds is such that they do not lend themselves to large-scale development. Copper is found (and was formerly worked) at Hoficial en-Nahas on a tributary of the Bah iel-Arab. Iron one deposits en-Nahas on a tributary of the Bah iel-Arab. Iron one deposits en-star in many districts, in the south and west the natives have smelled iron for many years, but, in the absence of coal, the deposits are of no economic value to the country's Statis produced by evaporation at Port Sudan in quantities sufficient to fulfil the country's requirements and provide a surplus for export

Trade—The principal exports of the Anglo-Egyptian Sudan are cotton and cottonseed, guin arabe, cattle and sheep, hides and skins, olicake, melon seed, peanuts and pulses. The principal imports are metals and metal manufactures, machinery and applances, vehicles and transport equipment, piece goods, fuel oil, kerosene and gasoline, coffee, tea, sugar, alcobile beverages, wheat and wheat flour, sacks and hessain. The accompanying table shows the value of external trade in selected years.

Trade of the Anglo-Egyptian Sudan

(11	minious or 15,	gypnan pound	1)		
Itcm	1913	1920	1941	1950	١

Authorities Government annual reports (for 1913 and 1920) and UN Statistical Year Book, 1951 (for 1941 and 1950)

Communications.-The railway and steamer services are operated by the government In 1950 the total length of railway in operation was 2,056 mi. Steamer services cover 2,325 mi The main railway line runs from Wadi Halfa via Atbara and Khartoum to Sennar with a main eastern branch from Atbara to Port Sudan on the Red sea, a subsidiary branch runs southward from Port Sudan through Kassala and Gedaref to Sennar, and a second branch runs westward from Sennar to El Obeid. The main steamer services ply from Wadi Halfa northward to the Egyptian river port of Shellal and southward from Kosti on the White Nile to Juba, the capital of the most southerly province. Khartoum is an important stopping place on the main Cairo-Cape air route, with feeder services to the east (Eritrea and Aden) and to the west The vast distances and the lack of sufficient pay load makes the provision of a modern system of roads uneconomic; consequently most rural tracks are rough and many have patches of soft sand Internal and international postal and telegraph services are available, and a number of the principal towns are connected to the international trunk telephone service to Egypt, Great Britain, Europe and the United States

Finance.-From the time of the reoccupation until 1912 there was an annual deficit which was made up by Egypt This debt was agreed at £E5,414,525 in 1938, and repayment of annual instalments began in 1949. Direct taxes, usually providing about 40% of the income, are the business profits tax, the animal tax, the land tax, tithes (ushur, assessed on crop values where no land tax is imposed), the date tax and the tribute (a lump sum assessed on a tube in lieu of animal and ushur taxes) Indirect taxes are derived from customs duties, the government sugar monopoly, liquor and motor vehicle licences Other sources of public reve nue are the post and telegraph services, the railways and the river steamers and the agricultural schemes. Reserve funds stood at £E12,000,000 on Dec. 31, 1949. The public debt was about £E13,000,000 in 1950. Between 1912 and 1945 revenues increased from about £E1,500,000 to £E5,000,000; the estimate for 1951-52 was £E24,782,000. Expenditure in the same period increased from £E1,500,000 to £E17,000,000. The Anglo-Egyptian Sudan has a common currency with Egypt; the Egyptian pound was equal to £1 os. 6d. sterling in 1952.

SUDAN, CAMPAIGNS IN: see EGYPT AND SUDAN CAM-PAIGNS (1882-1000)

SUDAN, FRENCH, one of the territones of French West Africa, lying toward the western end of the geographical Sudan, between the Sahara (the Southern Territories of Algeria) and the Ivory Coast. The area is 460,308 eq mi

The western part of the territory includes the valley of the upper Senegal river; the centre and the east companse that of the middle Niger At first the Niger and its tributary the Ban form a sort of mesopotamian region. Then the Niger flows on into an alluvial zone characterized by numeious branch streams and lakes (Lake Debo, Lake Faguabine, etc.) and submerged by flooding in the ramy season. At Timbuktu (Tomboutcou) the river inso into harder rock and change its course from a northeasterly one to an easterly, which shortly becomes southeasterly. Within the loop thus formed stands a sandstone plateau, the Bandagana escarpment; to the north is the Sabara, with the mountainous advar of the Hora.

The climate in the south is typically Sudanic: rainfall amounts to more than 25 in. a year, and the dry season lasts from November to June The vegetation consists of tall grasses with trees here and these. The middle region, or Sahel, has the sparser, prickly vegetation of a steppe. Not to fit the Nigel loop the deserbegins, with great heat (especially from March to May). Lions, hippopotamuses and antelopes are plentfull

History—The empire of Ghana dominated the Sahel between the Senegal and the Niger from the 4th to the 17th century; that of Mail controlled the middle Niger from the 17th to the 17th. The empire of Gao, which began in the 7th century, was overthrown by Moorsh invaders in 1501

For the story of an alleged 15th-century visit to Gao see
DISALGUERS, ANSERIMS MUNG Park explored the Niger in 1796
and in 1805. René Callié reached Timbuktu în 1828. Eugène
Mage în 1864 and J S. Galliem in 1889 swisted the court of
Alimadu (son and successor of the marabout Omar al-Hai) at
Segu (Ségou), when tethey were held captive for some time Gae

tave Borgnis-Desbordes occupied Bamako in 1881, then Lous
time of the Sahart stork place on the sarty years of the sortection of the Sahart stork place in the early years of the sortectury. The colony was first known as Upper Senegal and Niger. In
1970 the Upper Volta was detached from it.

Population.—The population in the middle of the 20th century was estimated at about 3,200,000 persons, with a density, therefore, of less than 7 per square mile. But only the south and the river valleys are consistently ribabilete. Apart from 7,000 Europeans (including 6,000 French people), the mhabitants are divided between White Africans and Negroes. The White Africans are nomads who occupy the Sahara and part of the Sahel, in the west, 50,000 Moors; in the east, 160,000 Turege.

The Negroes are cultivators and also engage in some stock trassing and commerce. The majority are Mandingo-speaking peoples inhabiting the mesopotamian region of the Niger and the adjacent country, of these 200,000 are Mailhaké, 1,100,000 Bambara and 43,000 Dioula (Jula). The Senoufo (1x9,000) and the Bobo (50,000) live in the south; the Dogo (1x9,000) on the Bandingara plateau, the Bozo fishermen and the Songhat (200,000) and the Markolde (250,000) on the Senegal. The stock-massing Peul are disseminated over the whole termtory.

Moslems constitute 55% of the population (Moors, Tuareg, Toucouleur, Sarakolé, Songhai, Dioula and Bozo), pagans 44% and Christians 0.5%. The Roman Catholic missions are French-

(there are three bishops), the Protestant ones American

(unere are inrec bishops), the Protestant ones American Bamako, the capital (about 100,000 mibatinats in 1952), has the administrative centice on the heights of Koulouba and extends for a Kayes (19,000) on the Senegal, Sequ (19,000), Mobil (10,000), Tim-buktu (7,000) and Gao (8,000) in the Nager valley, and Shkasso (15,000) in the south. Houses are built of red earth, with a treac-tive "Scalance style" of architecture). The health service has a large generative for The health service has a large generative hospital and an institute for

the control of leprosy at Bamako, six secondary hospitals, 35 dispensaries and 23 materiaty hospitals. In 1952 the primary schools had 23,000 pupils, secondary schools comprised a lycée and three collèges, and

there were five technical colleges

Government.—The territory, which is divided into 16 circles and 27 subdivisions, is administered by a governor, who is assisted by a territorial assembly elected by direct suffrage. All the inhabitants have French citizenship and all heads of families have a vote. The territory is represented in Paris by four deputies in the national assembly, by four senators and by five councillors of the French union courts of law

Economy.—About 77,000 sq mi can be used for agriculture (in the south and in the river valleys) Food crops are millet (of which there south and in the river valleys) Food crops are millet (of which there was a yield of 650,000 metric tons in 1952), maize (70,000 tons), fomo (Paspalum longistorum), beans, yams, cassava and sweet potatoes (Paspalam longiforum), beans, yams, cassava and sweet potatoes Ruce, the growing of which was promoted by inigation, gave a yield as high as 160,000 tons in 1952. Industrial crops are peanuts (100,000 tons, with shells, in 1952), cotton (6,000 tons) and sisal (400 tons), Natural products of economic importance include kapok (500 tons), shea butter (10,000 tons) from the kaute tree (Butyrospermum parku)

snea Dutter (15,000 cons) from the salary are (15,000 cons).

The "Niggi office," established in 1919 by the engineer Bélime, built dams at Southa and Sansanding to promote the irrigation of the area hable to flood. In this area 20,000 African farmers were settled, and by 1952 it was producing 26,000 tons of rice, 1,400 tons of cotton and

5,000 tons of peanuts

5,000 cons or peanuts
Stock raising accounted in 1952 for 2,300,000 humped cattle, 3,200,000 steep, 3,500,000 goats, 160,000 asses, 80,000 camels and 60,000 horses. These herds supply beasts for export in large numbers to the southern territories of French West Africa.

Mineral resources are meagre there is some alluvial gold and, in the Sahara, some deposits of salt (Taoudeni).

Sahara, some deposts of sall (Taoudeni).

Reside the traditional catifs (leatherwork, weaving and carpet making), industries connected with food and building have grown upmaking), industries connected with food and building have grown upmaking), industries connected with food and building have grown upmaking), industries connected with food and the property of the property Bamako, at Kayes and at Gao.

SUDATOREUM, in architecture, the vautled sweating room sinia to Nigeria. At present 16 main divisions are recognized

SUDATORIUM, in architecture, the vaulted sweating room (sudor, sweat) of the Roman thermae, referred to in Vitruvius (v, II), and there called the concamerata sudatio. In order to obtain the great heat required, the whole wall was lined with vertical terra-cotta flue pipes of rectangular section, placed side by side, through which the hot air and the smoke from the hypocaust (q.v.), or hollow floor, passed to the roof. (See BATHS;

LACONICUM )

SUDBURY, SIMON OF (sometimes called Simon Theo-BALD or Tybald) (d, 1381), archbishop of Canterbury, was born at Sudbury, in Suffolk, studied at the University of Paris and became one of the chaplains of Pope Innocent VI, who sent him, in 1356, on a mission to Edward III of England, and in 1361 appointed him bishop of London From 1375, when he was made archbishop of Canterbury, he was a partisan of John of Gaunt, In July 1377 he crowned Richard II; in 1378 John Wychiffe appeared before him at Lambeth, Chancellor of England from 1380, Sudbury was regarded by the peasants, who were in revolt, as one of the authors of their distress, and the Kentish insurgents damaged his property at Canterbury and Lambeth and, dragging him from the Tower of London, beheaded the archbishop on Tower hill on June 14, 1381

See W F Hook, Lives of the Archbishops of Canterbury.

SUDBURY, a city in northern Ontario, Can, 264 mi N of Toronto, on the Canadian Pacific and the Canadian National railways It produces more than 90% of the world's nickel and almost all the copper produced in Ontario The smelter of the International Nickel company is at Copper Cliff, a suburb to the west, and the Mond company's smelter and sulphuric acid plant is 8 mi. E. at Coniston A government school of mines and a Jesuit

college are situated there Pop (1951) 42,410

SUDBURY, a municipal borough of West Suffolk, Eng, in the parliamentary division of Sudbury and Woodbridge (1951) 6,614. Area 3 sq mi It lies on the river Stour (navigable up to the town), 22 mi. W. of Ipswich by road One of the mediaeval wool towns, it has many beautiful half-timbered buildings and three Perpendicular churches All Saints, with a fine oaken pulpit dating from 1490, St. Peter's, with a carved nave roof; and St Gregory's, once collegiate, which contains a rich, spire-shaped font cover of wood, gilded and painted. The grammar school was founded by William Wood in 1401 (rebuilt 1857) Wool was replaced by the manufacture of coconut matting; silk manufactures were transferred from London during the 10th century, when horsehair weaving was also established

Thomas Gainsborough (1727-88) was born there, and an earlier native was Simon Tybald, archbishop of Canterbury, who was murdered in Wat Tyler's rebellion and whose head is preserved in St. Gregory's. Before the conquest the borough was owned by the mother of Earl Morcar of the Northumbrians, from whom it was taken by William I It was alienated from the crown to an ancestor of Gilbert de Clare, earl of Gloucester, who in 1271 gave the burgesses their first charter confirming to them all their an-

cient liberties and customs. Sudbury was incorporated in 1554 SUDD, a vegetable obstruction on the upper Nile. It is composed of compacted masses of plants consisting chiefly of a grass, Vossia procera, with Saccharum spontaneum, which cover a large area of the Ghazal swamps. Loosened by storms, these plants reach the main channel near the Sobat river junction, lodge on some obstruction and form a dam, sometimes 25 mt, in length and nearly 20 ft, below the surface. These peaty blocks of decayed vegetation and soil are compressed by the current so that in parts they can support an elephant. At length the pressure of the water forms a side channel or causes the sudd to burst. (See Nile.)

See O. Deuerling, Die Pflanzenbarren der afrikanischen Flusse (Munich, 1900); H. G. Lyons, The Physiography of the Nile and Its Basin (Cairo, 1906).

SUDERMANN, HERMANN (1857-1928), German writer, was born at Matziken, East Prussia, on Sept. 30, 1857, of a Mennonite family long settled near Elbing. His father owned a small brewery, but because of a financial crisis was obliged to apprentice his son, at the age of 14, to a chemist. Young Sudermann was able, however, to study at Tilsit and afterward at Konigsberg university. He then went to Berlin, where he acted as tutor in several houses and worked as a journalist on the Deutsches Reichsblatt (1881-82), afterward turning to novel writing.

His novels Im Zwielicht (1886), Frau Sorge (1887), Geschwister (1888) and Der Katzensteg (1890) revealed neither beauty nor emotional power, but invariably showed keen observation, a vivid touch and dramatic technique. The tale is his chief concern, and he shows a masterly control of tension, as in Closuthes Hochseit (1892), Es Wor (1894) and Das Hohe Lied (1908) showed a falling off, but the old mastery reappeared in Lataussche Novellein (1017)

More mstantly popular, and later more butterly decried, were plays, of which Die Eber (1880) brought him mendants lame, and Hamat (1892), better known as Magda, made him known throughout Europe Part of the great success of Magda was no doubt due to the fact that the title-rôle was interpreted by Modjeska, Berhardt, Duse, and Mrs Patrick Campbell. His dramas, Sodoms Ende (1891), Inhamusfeuer (1900), Es Lebe Das Lebes (1912), Der Stumpsselle Sobretes (1903), Strick Utter Der Stemen (1915) and numerous others ending with Der Hanselfellhandle (1935) were uniformly successful on the stage. During the World War he wrote the cycle of three plays collectively entitled Der Entytoters Will His last novels were Der tolle Projessor (1926) and Puralchen (1928). He belonged to the realistic movement of the last quarter of the roth century, and was not very sympathetic to the new methods and new outlook of post-war literature. He deel at Berlin on Nov 23, 1938

post-wat increasure: Lee Gueta to be benin on 1907 22, 1920

His dramatic works were collected in 1923. See also his autobiography. Das Bilderbuch, memer Jugend (Eng. Irans, NY 1924).

SUE, EUGENE [Joseph Marie] (1804-1857), French novelist, was born in Paris on Jan 20, 1804 He was the son of a distinguished surgeon in Napoleon's army, and is said to have had the empress Tosephine for godmother. Sue himself acted as surgeon both in the Spanish campaign undertaken by France in 1823 and at the battle of Navarino (1828). In 1829 his father left him a fortune, and he settled in Paris. His naval experiences supplied much of the materials of his first novels. In the quasi-historical style he wrote Jean Cavalier, ou Les Fanatiques des Cevennes (4 vols, 1840) and Latréaumont (2 vols, 1837). He was strongly affected by the Socialist ideas of the day, and these prompted his most famous works. Les Mystères de Paris (10 vols., 1842-1843) and Le Juit errant (10 vols., 1844-1845). which were among the most popular specimens of the romanfeuilleton He followed these up with some singular and not very edifying books. Les Sept péchés capitaux (16 vols., 1847-1849) which contained stories to illustrate each sin, Les Mystères du beuble (1849-1856), which was suppressed by the censor in 1857

Some of his books, among them the Intl errant and the Mysics of Parat, were dramatized. After the revolution of 1848 he sat for Paris (the Seine) in the Assembly, and was exited after his protest against the conp d'était of Dec. 2, 1851. His later works were inferior. Sue died at Annecy (Savoy) on Aug. 3, 1857

SUEBI or SUEVI, a callective term applied to a number of peoples in central Germany, the chief of whom were the Marcomann, Quadi, Hernunduri, Semnones, and Langobardi; these trabes inhabited the basin of the Elbe. Tacitus uses the name Suchi in a worder sense to include not only the tribes of the basin of the Elbe, but all the tribes north and east of that river, including even the Swedes (Sulones).

From the 2nd to the 4th century AD, the name Suebi is seldom used except with reference to events in the neighbourhood of the Pannonian frontier, and here probably means the Quadi. From the middle of the 4th century it appears in the regions south of the Main, and the names Alamanni and Suebi are used synonymously The Alamanni (q.v.) seem to have been joined by one or more other Suebic peoples, some of whom accompanied the Vandals in their invasion of Gaul and founded a kingdom in northwest Spain Besides the Alamannic Suebi we hear of a people called Suebi, who shortly after the middle of the 6th century settled north of the Unstrut There is evidence also for a people called Suebi in the district above the mouth of the Scheldt. It is likely that both these settlements were colonies from the Suebi of whom we hear in the Anglo-Saxon poem Widsith as neighbours of the Angli. The question has been raised whether these Suebi should be identified with the people whom the Romans called Heruli. After the 7th century the name Suebi is practically only applied to the Alamannic Suebi (Schwaben), with whom it remains a territorial designation in Wurttemberg and Bavaria

mans a territorial designation in with the sear, B.G. 1 37, 51 et seq, iv 1 et seq, vi 0 et seq, Strabo, p 390 et seq; Tactus, et seq, vi 1 et seq, vi 0 et seq, Strabo, p 390 et seq; Tactus, Germana, 36 et seq, K Zeuss, De Deutschen and die Nachbardammen, pp 55 et seq, 315 et seq; C Bremer in Paul's Grundriss (and et), in 197-590, H M Chadwick, Origin of the English Nation, 216 et seq (Cambridge, 1907).

SUECA, a town of E Spain, in Valencia Pop (1940), 16,864

SUEČÁ, a town of É Špan, in Valencia Pop (1940), 16,864 (mun, 19,890) Sueca is separated from the Medietreranen (7m east) by the Sierra de Cullera It is a modern town, although many of the houses have the flat roofs, view-turrets (muadors) and horseshoe arches characteristic of Mousish architecture Sueca has a thriving trade in grain and fruit from the Júcar valley, which is irringed by materiass, created by the Moors

SUEDE FINISH, a nap produced by separating the surface fibres of leather on a cathorudum or enercy wheel Although this piecessing may be directed either at the grain of leather or the flesh surface, it is mere often applied to the latter. Suede finish usually indicates chrome or alimit tanning as opposed to vegetable tanning, and the resulting leather is soft, pillable, and

Stong It is used for shoes, hats, coats, gloves, belts and handbags SUESSULA, an ancient town of Campania, Italy It commanded the entrance to the Caudine pass (See Caudine Forks)
Traces of the theatre may still be seen Oscan tombs were exavated, and vases, bronzes, etc., have been found Suessula lay on the Via Populia On the hills above Cancello to the east of Suessula was stutated the fortified camp of M. Claudins Malcellus, used as an outpost against Hanmbal in Capua (See Punic Wasch).

SUETONIUS TRANQUILLUS, GAIUS, Roman historna, lived during the end of the stat and the first half of the and century at a He was the contemporary of Tactus and the younger Pliny, and his theraty work seems to have been cheely done in the reigns of Tasjan and Hadrana (a.n. 98–186). His father was multary tributes in the XIIIth legon, and he humself began life as a teacher of rhetoric and an advocate. To us he is known as the lographer of the twelve Cascars (including Julius) down to Domitian. As Hadran's private secretary (magistar epistolarum), he must have had access to the Impenia farthwes, e.g., the transactions of the senate. He was a correspondent of the younger Pliny, who as governor of Bithynia took Suctionus with Im Hadran's biographer, Aclius Spartianus, tells us that Suetonius was deprived of his private secretaryship because he had to been sufficiently observant of court etiquette towards the emperor's wife during Hadrans's absence in Britain

The Lives of the Cosson is tather a chronicle than a history It gives no general picture of the period. It is the empeore who is always before us, yet the portinit is drawn without real insight for the personal anecolotes are very amusing; but the author panders too much to a taste for gossip. None the less he is next to Tactius and Dio Cassius the chief (sometimes the only) authority. The language is clear and simple Of his De viris illustribus, the lives of Terence and Hotace, fragments of those of Lucan and the delder Phiny and the greater part of the chapter on grammariams and rhetoricansa, are extant. Other works by him (now lost) were Prata (= hatpluors=patch-work), in ten books, a kind of encyclopsedia; the Roman Year, Roman Institutions and Customs, Children's Games among the Greeks, Roman Public Spectacles, On the Kings, On Cicew's Republic.

SUEZ, a port of Egypt on the Red sea and southern terminus restored the waterway till finally trade between Europe and the of the Suez canal Pop (1937) 49,686 Suez is supplied with water by the fresh-water canal, which starts from the Nile at Cairo and was opened in 1863 Before this, water had to be brought from "the Wells of Moses," a small oasis 3 mi distant About 2 mi S of the town are the quays constructed on the canal and connected with the town by an embankment. On one of the quays is a statue to Thomas Waghorn, the organizer of the "overland route" to India The ground on which the port is built has all been reclaimed from the sea. The accommodation provided includes a dry dock 410 ft long, 100 ft broad and nearly 36 ft deep There are separate basins for warships and merchant ships, and in the roadstead at the mouth of the canal is ample room for shipping. Suez is a quarantine station for pilgrims from Mecca

In the 7th century a town called Kolzum stood, on a site adjacent to that of Suez, at the southern end of the canal which then joined the Red sea to the Nile On the Ottoman conquest of Egypt in the 16th century Suez became a naval as well as a trading station, and there fleets were equipped which for a time disputed the mastery of the Indian ocean with the Portuguese According to Niebuhr, in the 18th century a fleet of nearly 20 vessels sailed yearly from Suez to Jidda, the port of Mecca and the place of correspondence with India The overland mail route from England to India by way of Suez was opened in 1837 The regular Peninsular and Oriental steamer service began a few years later, and in 1857 a railway was opened from Cairo through the desert The present railway follows the canal from Suez to Ismailia and Zagazig, whence branches diverge to Cairo and Alexandria

SUEZ CANAL, an artificial waterway about 100 mi long, connecting Port Said on the Mediterranean sea with Suez on the Red sea, thus enabling shipping between Europe and the east to avoid the long sea passage by the Cape of Good Hope.

The Isthmus of Suez is one of the world's crossways. It joins the African to the Asian continent. It separates the Mediterranean from the sea routes that lead most directly to the far east At its narrowest point it is barely 75 mi across At the end of the Tertiary period a channel joined the two seas. As a result of marine deposits, of silting from the Nile and probably also of seismic action, the isthmus gradually assumed the aspect which it presented to travellers before the construction of the Suez canal, a waste of sand dunes with occasional salt depressions At one time the over Nile entered the Mediterranean by seven separate channels instead of two only as at present. The Pelusiac, the most easterly of these branches, passed north of the site of modern Kantara, while the Tanitic branch entered the Mediterranean about 10 mi. E of the present town of Port Said. Farther south the Bitter lakes remained for long connected with the Red sea.

The Earliest Canal in History,-Plans to traverse Egypt with a navigable waterway, or at any rate to connect lower Egypt with the Red sea, go back to very ancient times. The need in those distant days was to link the important commercial centres of the Nile valley with the Red sea trade routes. The Nile itself assured exit at need to the Mediterranean. And so it is that the earliest canals of which history has mention were constructed to link the Nile valley to the Red sea and not to pierce the narrow neck of land which separated the latter from the Mediterranean, There has been much argument among scholars about the dates and exact alignments of these earliest works

The available evidence is meagre enough but it seems to be established that, perhaps as early as 2000 B.C., a canal linked the Pelusiac branch of the Nile, via the Wadi Tumilat, with the Bitter lakes, whence another channel was dug to the Red sea Following the vicissitudes of Egyptian political history this canal was sometimes allowed to fall into disuse, and again, depending on the vigour of individual rulers, it was re-excavated to serve the southward-looking commerce of the day. After the Persian conquest Darius the Great is credited with the restoration and enlargement of the canal of the Pharaohs. The Ptolemies, followed by the Romans and later still by the Arabs, are known to have

east passed to other routes and into the hands of other people

Maratime Canal Projects.—The Cape route to India and the east was discovered in 1498 This gave to the countries on Europe's western seaboard an immense advantage in the competition for Indian trade France, however, looks out not only onto the Atlantic but onto the Mediterranean and this, combined with its growing political and economic rivalry with England, explains why the thoughts of Frenchmen turned early to the possibility of piercing the Isthmus of Suez with a navigable waterway. This possibility was often debated in French writings during the 17th and 18th centuries, the discussions all being coloured by the then prevalent misconception that an important difference in levels existed between the two seas that the contemplated channel was intended to unite. It was against this background that, in the struggle against England, Napoleon was sent by the Directory (1708) to occupy Egypt With him went a distinguished French engineer, Charles Lepère, with orders to study and report on the possibility of constructing a sea-to-sea canal across the Isthmus of Suez Lepère, labouring under the still prevalent misconception that the level of the Red sea was about 30 ft higher than the level of the Mediterranean, reported against a canal to join the two seas and advocated instead the reopening of the old canal of the Pharaohs It was left to M A Linant de Bellefonds, another notable French engineer, to prove (1853) that the difference in levels between the two seas was unimportant and so to remove what was until then regarded as an almost insuperable difficulty in the way of excavating a navigable channel to cut the Suez isthmus. In the meantime the Saint-Simonians had interested themselves in the project. It was they who, after some abortive explorations in the isthmus, founded (1846) an international organization called the Société d'Études pour le Canal de Suez This body had for its object a full study of the whole subject, including the possibility of attracting the support of European investors in the enterprise.

De Lesseps .- The stage was now set for the arrival on the scene of a French personality of the first order Born in 1805. Ferdinand de Lesseps (q v), following in his father's footsteps, entered the French diplomatic service. At the age of 27 he was appointed vice-consul at Alexandria, where later (1835) he was promoted consul general From the five years he spent in Egypt at this time may be dated the first stirrings of the great ambition which was presently to dominate his life He read Lepère's reports with fascinated interest while he also enjoyed the friendship of Linant de Bellefonds.

His social gifts and the charm of his personality were such that he gained the particular favour of the viceroy, Mohammed Ali. With the latter's younger son, Mohammed Said, he was on terms of affectionate intimacy After service in Rotterdam, Barcelona, Madrid and Rome he returned to private life In his new-found lessure his thoughts turned again to Egypt and to the possibility of piercing the Suez isthmus with a navigable canal

An unexpected chance favoured him. Abbas, who had succeeded Mohammed Ali as viceroy, was violently suspicious of western, and particularly of French, influence. He was murdered in 1854 and was succeeded by Said, De Lesseps' close friend. On hearing of Said's succession De Lesseps started immediately for Egypt. His hopes of enlisting the sympathy of the new viceroy for the project he had at heart were well founded. On Nov 30, 1854, Said signed what is known as the first act of concession. It authorized De Lesseps to form the Compagnie Universelle du Canal Maritime de Suez, the purpose of the company being to pierce the Isthmus of Suez by a navigable canal, to exploit the waterway when constructed and to build one or two ports at its extremities The concession was to last for 99 years.

The Company Formed,-This was followed by a second and more precise act signed by Said on Jan 5, 1856. The statutes of the new company formed an annex to this act which also recited that, subject to the approval of the viceroy's suzerain, the sultan of Turkey, the canal and its dependent ports should be open at all times comme passage neutre to all merchant ships without distinction of individuals or of nations, provided that the transit dues were duly paid. The company itself in a succeeding article was expressly prohibited from according to any individual or to any company or organization any particular or preferential treatment whatsoever The period for which the concession was to last was confirmed at on years, to count from the date on which the canal was opened for navigation. At the end of that period. and in default of other airangements, the canal was to pass into the hands of the Egyptian government. In addition to the mantime canal the company was made responsible for excavating a fresh-water canal from the Nile near Cairo to Lake Timsah, from where branches were to run parallel to the new waterway, one north to Pelusium and the other south to Suez. The company was to have the right to fix and levy transit dues on ships and passengers subject to the restriction that such dues might not exceed 10 fr per ton or per passenger The company's central offices were to be located at Alexandria with administrative headquarters in Paris. The Egyptian government was to receive as a first charge 15% of the net profits, while a further 10% was to he distributed to those persons who had helped most in the fulfilment of the enterprise The company's sanctioned capital was to consist of 200,000,000 fr divided into 400,000 shares of 500 fr. each

Before the signing of the second act of concesson De Lesseps had assembled (Oct 1853) an International Scientific commission composed of eminent engineers and naval experts from various countries, including Great Britain A subcommittee of this commission visited Egypt to advise about the actual alignment of the proposed canal In accordance with the subcommittee's advise it was deeded, with the viceroy's approval, that the channel should run in a direct line from Suse to the Gulf of relusion, passed and the subcommittee's advise to the Gulf of relusions, passed to the countries of the subcommittee and the subcom

British Opposition—The concession had hardly been signed when political complications arose. The British government, from fear of French pretensions in Egypt and annous about the safety of communications with the British Indian emprise, est itself to oppose the construction of the canal by every means in its power. Not content with making its displeasure felt in Carvo, the British government used all its influence, consideable at this time, in Constantinople to prevent the sultan's government from giving its approval to the acts of concession signed by the viceoy. In the result it was not until March 10, 1866, that the sultan's sanction was forthcoming, by which time the work of constructions the control of the sultant in the result is already under way.

For De Lesseps, undeterred by Palmerston's threats and abuse or by the wcullations of the Sublime Porte, the moment the second act of concession was signed set the work in train. The shares of the new company were placed on the market in Nov. 183 With the vision that inspired all his actions, De Lesseps had decided that all the western powers should participate in financing the enterprise. Blocks of shares were therefore set aside for each of these countries, including a block of 30,000 shares, one-fifth the whole issue, for Great Britain.

His hopes were, however, disappointed. Neither Great Britain nor the United States (the latter had been offered a block of 20,-000 shares) subscribed at all More than half the shares (207,111) were taken up in France, while the Egyptian government, which had been allotted a block of 64,000, actually subscribed for 177,not to wait for the sultan's approval and on April 25, 1859, he himself turned the first spadeful of sand at the site where later was to rise the town of Port Said. Soon, however, he ran into difficulties. Under British pressure a formal order emanated from the sultan requiring all operations on the spot to cease forthwith. Expenses were heavy as well, and the actual progress made was disappointing by comparison. Nevertheless, by 1862 the freshwater canal had reached Lake Timsah and toward the end of the same year a narrow channel had been excavated between Lake Timsah and the Mediterranean. In 1863 the fresh-water canal was continued to Suez. In the meantime Port Said itself was rising on the former flats and marshes of Lake Menzala.

So far the work had been done by Egyptian labour The second act of concession provided that at least four-fifths of the labourers employed by the company should be Egyptians, and later the vice-10y undertook to supply labouters as required by De Lesseps' engineers, who were to house and feed them and also to pay them at certain specified rates Although wages and conditions were both better than the men could obtain elsewhere in the Egypt of that day, the khedive Ismail, who had succeeded Said on the latter's death in 1863, allowed himself to be persuaded that for the good of the country the men would be better employed elsewhere The British government in its tireless resistance to the whole project made representations to the same effect in Constantinople As a result the Sublime Porte ordered (April 1863) not only that "forced labour" should cease but that the company should retrocede to the Egyptian government the bulk of the lands granted to them by Said in 1856 On Jan 16, 1864, the company appealed to the emperor Napoleon III asking him to arbitrate, ostensibly in order to protect the considerable French capital already sunk in the enterprise By his award, made in July 1864, the company was allowed 38,000,000 fr as compensation for the abolition of "forced labour," 16,000,000 fr. for the retrocession of the Wadi-Lake Timsah-Suez section of the fresh-water canal (the upstream portion between the Nile and Wadi had already been handed back by an agreement dated March 18, 1863) and 30,000,000 fr. in respect of certain lands granted to the company by Said The compensation, 84,000,000 fr. in all, was to be paid to the company over a period of 15 years

The emperor's award was accepted by both parties, and from this date onward the work made rapid progress. More machinery was imported to compensate for reduction in labour force. Political opposition to the project had also by this time died away. Finally in the summer of 1869 (the waters of the Mediterranean and the Red sea were united in the Bitter lakes.

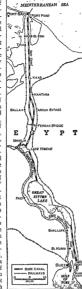

Altogether up to the end of 1869, when it was possible to open the canal for traffic, the accounts of the company showed a total expenditure of 432,807,882 fr

The Opening of the Canal.—The canal was formally opened on Nov. 17, 1869, amid scenes of great splendour, the procession of shaps being headed by the French impernal yacht. "Angie" with the empress Eugéme hersell on board De Lesseps dieaem, so long chenshed, thus ended in trumph Great Britani, tardily generous, rendered him toward the end of this same year all the honour and all the credit that were his due He was received in London by Queen Victoria, who confaired upon him the insigna of knight grand commander of the Star of India. He was made a freeman of the city of London and a magnificent fete was held in his honour at the Crystal palace.

As originally constructed the canal had a depth of 8 m with a bottom width of 22 m Over the years after 1860 the Suez Canal company was diligent in improving, widening and deepening the waterway. In the early days, except in the Bitter lakes, vessels could pass each other only at certain crossing places or gares As a result of successive widenings passing became possible at any point over the greater part of the canal, one vessel stopping while the other proceeds on her way. The width of the canal had by 1053 been increased to 120 m. The depth of the central channel (nowhere less than 60 m. wide) was 13 50 m., permitting the passage of ships with a draught up to 34 ft. In 1948 the board of directors undertook two further important improvements was decided to deepen the navigable channel by 50 cm., permitting the passage of vessels with a draught of 36 ft. In addition, a bypass channel II km, long was excavated in the northern section of the canal. Ships making the passage of the canal were marshalled in convoys, and the existence of this channel, which was opened to traffic in 1951, made it possible for north- and southbound convoys to pass each other without meeting in the main canal. For all these improvements and for annual maintenance, the latter in itself no mean task, the company maintained a staff of highly qualified engineers In addition, all proposed major works were scrutinized each year by an International Consultative commission composed of distinguished engineers, with specialized marine experience and recruited from various countries, including part of De Lesseps' International Scientific commission, was assume the responsibilities placed upon Turkey by that instrument

brought into being as long ago as 1884

International Status .-- As already mentioned article to of the second act of concession prescribed that the canal should always be open comme passage neutre to merchant ships of all nations Neither this nor the sultan's firman of 1866 approving the grant of the concession sufficed however to "neutralize" the canal For a status of neutrality can be conferred only by international agreement De Lessens himself had always been in fayour of the canal's being proclaimed neutral, and the issue assumed acute form at the time of the Arabi revolt (1881-82) As a result a convention was signed at Constantinople on Oct 20. 1888, by representatives of France, Great Britain Germany, Austria-Hungary, Italy, Russia, Spain, Turkey and the Netherlands Article 10 of this convention recites that the canal shall always "be free and open, in time of war as in time of peace, to every vessel of commerce or of war, without distinction of flag." Great Britain, however, in signing formulated a reservation that the provisions of the convention should apply only in so far as they were compatible with the actual situation in Egypt and in so far as they would not fetter the liberty of action of the British government during its occupation of that country But by the Anglo-French agreement of April 8. 1904, Great Britain declared its adherence to the stipulations of the convention and agreed to their being put into force except as regarded a provision by which the agents in Egypt of the signa-

MAD OF THE SHET CANAL

tory powers were to meet once a year to take note of the due execution of the convention. But though the principle of free user is confirmed by article 10 of the

convention of 1888 it does not seem possible to maintain that the canal enjoys a status of neutrality No warlike acts can, it is true, be committed within its limits without a violation of the convention. It is not on the other hand like a neutralized territory over which passage of armed forces is denied to belligerents. Equally the territorial waters of a neutral state provide no exact parallel, for in their case there are no limitations as to time of arrival and departure. After World War I the Central Powers who were signa-

three from Great Britain This commission, the modern counter- tories of the convention of 1888 agreed that Great Britain should

During World War I the entire resources of the Suez Canal company were placed at the disposal of the British military authorities who were responsible for the defense of Egypt's eastern frontier against the Turks The Turkish attack (Jan.-Feb 1915) was repulsed and thereafter till the end of the war traffic through the canal continued without interruption. In World War II the company once again placed its staffs, equipment, workshops, all its resources in fact, at the disposal of the British armed forces then defending Egypt's western frontier against Italy and Germany No serious land threat developed during that war, though the canal was heavily bombed in 1940 and again in 1941

The Activities of the Company.-Management of the Suez Canal company is entrusted to a board of 32 directors Of these, by 1053, nine were British When Great Britain, thanks to the prompt and audacious action of Disraeli (see Beaconspield,

BENJAMIN DISRAELI, EARL OF), acquired the khedive's shares (176,602) in 1875, it secured three seats on the hoard, while hy an agreement dated Nov 30, 1883, between the company and representatives of the British shipping industry, seven (by 1953, six) seats were allotted to British shipping interests. The composition of the board by 1953 was as follows French 16, British 9, Egyptian 5, Dutch 1, US 1. The board meets once a month in Paris A committee of eight directors chosen by the board meets once a week under the chairmanship of the president to conduct the current affairs of the company, subject, where the statutes so prescribe, to the final approval of the board or, as the case may be, of the general assembly of the shareholders. This last meets once a year, also in Paris Two of the British government directors have seats on the committee of management

In Egypt the relations of the company with the Egyptian government are conducted through an agent supérieur with his headquarters in Cairo. The headquarters of the canal management are at Ismailia There the company's staffs are organized in three principal departments works, traffic and administration. The traffic department has sole charge of the passage of ships through the canal, marshals convoys, controls their timings and speed (the maximum speed permitted is 14 km per hour), allots berths to ships and manages the pilot service. Engineering work of all kinds, including dredging, is in charge of the works department All questions of staff and of establishments generally are the responsibility of the administration department,

In 1924 the company's shares were doubled in number, to 800,-000. Of these the British government hold 353,204. The shares are subject to redemption by annual drawings ending in 1968 when the company's concession is due to expire. All holders of 25 or more shares are entitled to vote at the annual general assembly of the shareholders. Each shareholder so qualified may cast ten but not more than ten votes.

The company through the years followed a wise policy over transit dues. This policy, frequently reasserted, was to revise the dues in a downward direction whenever a prudent consideration of its own financial position made it possible. The 1953 rates of transit dues were 36 50 Egyptian plastres per Suez net ton for laden ships and 17 piastres per Suez net ton for ships in ballast. Dues on passengers were abolished by a decision of the board taken in 1951

In the early days of the company there was some difference of

opinion about the method of measuring ships for the assessment of transit dues An international commission met at Constantinople in 1873 to discuss the question, the Bittish (Moorsom) system was recommended and after 1874 "Suez net tonnage" was raiculated aftet this system

\*Yearly average

The relations between the company and the Egyptian government have always been intunate and cordul. These relations were regulated as the need arose by a series of conventions freely negotiated between the company and the government. The last of these, dated March 7, 1949, provided mer alla for increased Egyptian representation on the board of directors, for a progressive increase in the employment of Egyptians in all ranks of the company's service and for an increased subvention (7% of the gross profils) to the Egyptian government

In 1952 the ships which used the Suez canal flew the flags of no fewer than 43 nations. The Suez canal is a permanent feature of world geography. It would be difficult to imagine a world deprived of the use of this waterway. That statement alone is perhaps the best tribute to Ferdinand de Lesseps. (F V W.)

perhaps the best tribute to Ferdinand de Lesseps (V. V.).

SUFFOLK, EARLS AND DUKES OF. These English titles were borne in turn by the families of Ufford, Pole, Brandon, Grey and Howard. Robert, son of a Suffolk landowner, John de Peyton, acquared he lordship of Ufford in that county and was known as Robert de Ufford. He held an important place in the government of Freihau diwide Edward I and ded in 1785; his son Robert, clieds arrivings on, another Robert (2, 1299–1350), was created Baron Ufford in 1309. Robert's clieds arrivings on, another Robert (2, 1299–1369), was Created Baron Ufford in 1309. Check and Politicas. On the death, without heirs, of his son William, the 2nd earl, who took part in the suppression of the pessants' revolt in 1381, the earldom became extinct, his extensive estates reverting to the crown

In 1385 the earldom of Suffolk and the lands of the Uffords were granted by Richard II to his friend Michael Pole (c. 1330—89), a son of Sir William atte Pole. (See Pole Family.)

In 1514 the title of duke of Suffolk was granted by Henry VIII to Charles Brandon (see Suproux, Charles Branbox, 187 BURS 07), and it became extinct on the death of his second son, Charles, in July 1527. In the same year it was revived in favour of Henry Grey, marquess of Dorset, who had married Frances, a daughter of the first Brandon duke. Grey, who became marquess of Dorset in 1530, was a prominent member of the reforming party during the reign of Edward VI. He took part in the attempt to make his daughter, Jane, queen of England in 1535, possible of the strength o

earldom was held by his descendants. (See Suffolk, Thomas Howard, IST Earl of.)

SUFFOLK, CHARLES BRANDON, 1ST DUKE OF (c. 1484-1545), was the son of William Biandon, standard bearer of Henry VII, who was slain by Richard III in person on Bosworth field He was high in Henry VIII's favour and held a succession of offices in the royal household. On May 15, 1513, he was created Viscount Lisle, having entered into a marriage contract with his ward, Elizabeth Grey, Viscountess Lisle in her own right, who, however, refused to marry him when she came of age. He distinguished himself at the sieges of Terouenne and Tournai in the French campaign of 1513 At that time Henry VIII was secretly urging Maigaret of Savoy, regent of the Netherlands, to marry Brandon, whom he created duke of Suffolk Brandon took part in the jousts which celebrated the marriage of Mary Tudor, Henry's sister, with Louis XII of France, on whose death he was sent to congratulate the new king Francis I An affection between Suffolk and the dowager queen Mary had subsisted before her marriage, and Francis charged him with an intention to marry her. Francis, perhaps in the hope of Queen Claude's death, had himself been one of her suitors in the first week of her widowhood, and Mary asserted that she had given him her confidence to avoid his importunities Francis and Henry both professed a friendly attitude toward the marriage of the lovers, but Suffolk had many political enemies, and Mary feared that she might again be sacrificed to political considerations. The truth was that Henry was anxious to obtain from Francis the gold plate and jewels which had been given or promised to the queen by Louis, and he practically made his acquiescence in Suffolk's suit dependent on his obtaining them. The pair cut short the difficulties by a private marriage.

Suffolk was only saved from Henry's anger by Wolsey, and the pair eventually agreed to pay to Henry £44,000 in yearly installments of £1,000, and the whole of Mary's dowry from Louis of £200,000, together with her plate and jewels They were openly married at Greenwich on May 13. The duke had been twice married already, to Margaret Mortuner and to Anne Browne. Anne Browne ded in 1511, but Margaret Mortuner, from whom he had obtained a divorce on the ground of consanguinity, was still living. He secured in 1528 a build from Pope Clement II assuring the legitunery of his marriage with Mary Tudor, and of the daughters of Anne Browne.

Suffolk was present at the Field of the Cloth of Gold m 150, and m 1523 he was sent to command the English troops at Calais He laid waste the north of France. Suffolk was in favour of Henry's divorce from Catherine of Aragon and, in spite of his obligations to Wolsey, attacked him when his fall was imminent. The cardinal, who was acquainted with Suffolk's private history, reminded him of his ingratitude. "If I, simple cardinal, had not been, you should have had at this present no head upon your shoulders wherein you should have had a tongue to make any such report in despite of us."

After Wolsey's diagrace Suffolk's influence increased daily. He was sent with the duke of Norfolk to demand the great seal from Wolsey; the same noblemen conveyed the news to Queen Catherne of Anne Boleyn's marriage, and Suffolk acted as high steward at the new queen's coronation. He was commissioned by Henry to dismiss Catherine's household. He received a large share of the plunder after the suppression of the monasteries. In 1544 he was for the second time in command of an English army for the invasion of France. He died at Guildford on Aug 44, 1545.

invasion of France. He need at Collision of Aug. 24, 1545.

There is abundant material for the history of Suffolk's career in the Letters and Papers of Henry VIII, ed by Brewer in the Rolls Senes See also Dugdale, Baronage of England, vol ii (1675); G. E. C., Complete Peeroge. An account of his mati uncount adventures is in the appendix to a novel by E. S. Holl, The Barvest of Festerdus.

SUIFOLK, CHARLES HOWARD, OTH EARL OF (1675-733), who succeeded to the tile in June 1734, married Henrietta, a daughter of Sir Henry Hobart, bart., of Bickling, Norfolk. Both husband and wife were in the household of the prince of Wales, who, as George II, acknowledged Mrs. Howard as hus mistress. She was formally separated from her husband before

1731 when she became countess of Suffolk The earl died on Sept 28, 1733, but the countess, having retired from court and married the Hon George Beakley (d. 1746), lived until July 26, 1767. Among Lady Suffolk's Iriends were the poets Pope and Gav and Charles Mordaunt (earl of Peterboroush)

A collection of Letters to and from Henrietta Countess of Suffolk, and her Second Husband, the Hon George Berkeley, was edited by J. W. Croker (1824) See also L. Melville, Lady Suffolk and her Circle (1924).

SUFFOLK, THOMAS HOWARD, 1ST EARL OF (1561-1626), second son of Thomas Howard, 4th duke of Norfolk, was born on Aug 24, 1561 He behaved very gallantly during the attack on the Spanish armada and afterwards took part in other naval expeditions, becoming an admiral in 1599 Created Baion Howard de Walden in 1597 and earl of Suffolk in July 1603, he was lord chamberlain of the royal household from 1603 to 1614 and lord high treasurer from 1614 to 1618, when he was deprived of his office on a charge of misappropriating money. He was tried in the Star Chamber and was sentenced to pay a heavy fine Suffolk's second wife was Catherine (d 1633), widow of the Hon Richard Rich, a woman whose avarice was partly responsible for her husband's downfall She shared his trial and was certainly guilty of taking bribes from Spain One of his three daughters was the notorious Frances Howard, who, after obtaining a divorce from her first husband, Robert Devereux, earl of Essex, married Robert Carr, earl of Somerset, and instigated the poisoning of Sir Thomas Overbury (q.v) The earl died on May 28, 1626

SUFFOLK, WILLIAM DE LA POLE, DUKE OF (1396-1450), second son of Michael de la Pole, second earl of Suffolk, was born on Oct 16, 1396 Suffolk served in all the later French campaigns of the reign of Henry V, and in spite of his youth held high command on the marches of Normandy in 1421-22 In 1423 he joined the earl of Salisbury in Champagne, and shared his victory at Cievant. He fought under John, duke of Bedford, at Verneul on Aug 17, 1424, and throughout the next four years was Salisbury's principal lieutenant in the direction of the war. When Salisbury was killed before Orleans on Nov. 3, 1428, Suffolk succeeded to the command After the siege was raised, Suffolk was defeated and taken prisoner by Jeanne d'Arc at Jargeau on June 12, 1429. He was soon ransomed, and during the next two years was again in command on the Norman frontier. He returned to England in November 1431, after over fourteen years' continuous service in the field

Suffolk had already been employed on diplomatic missions by John of Bedford; anxious for peace, he attached himself to Cardinal Beaufort The question of Henry VI.'s marriage brought him to the front Humphrey of Gloucester favoured an Armagnac alliance. Suffolk brought about the match with Margaret of Anjou. When he returned to England in June 1444, after negotiating the marriage and a two years' truce, he received a triumphant reception He was made a marquess, and in the autumn sent again to France to bring Margaret home. The French extorted from him a promise to surrender all the English possessions in Anjou and Maine, a fatal concession Humphrey of Gloucester died in February 1447, within a few days of his arrest, and six weeks later Cardinal Beaufort died also Rumour, though without sufficient reason, made him responsible for Humphrey's death, while the peace and its consequent concessions rendered him unpopular. So also did the supersession of Richard of York by Edmund Beaufort, duke of Somerset, in the French command Suffolk's promotion to a dukedom in July 1448, marked the height of his power. The difficulties of his position may have led him to give some countenance to a treacherous attack on Fougères during the time of truce (March 1449). The renewal of the war and the loss of all Normandy were its direct consequences. When parliament met in Nov. 1449, the opposition showed its strength by forcing the treasurer, Adam Molyneux, to resign Molyneux was murdered by the sailors at Portsmouth on Jan. 9, 1450. Suffolk boldly challenged his enemies in parliament, appealing to the long and honourable record of his public services. The Commons now presented articles of accusation dealing chiefly with

alleged maladministration and the III success of the French policy, there was a charge of anumg at the throne by the betrohal of his son to the little Margaret Beaufort Suffolk demed the accusations as false, untrue and too borrible to speak more of Ultimately the king sentenced him to banishment for five years Suffolk left England on May I. He was intercepted in the Channel by the ship "Nicholas of the Tower," and next morning was beheaded in a little boat clanesade

Popular opinion at the time judged Suffolk as a trator. This view was accepted by Vorkist chroniclers and Tudor historians, who had no reason to speak well of a Pole Later legend made him the paramour of Margaret of Anjou, which story appears in the Mirrour for Magistrates, and Shakespeare's a Henry II (Act III se i) Suffolk's best defence is contained in the touching letter of farewell to his son (Paston Letters, 1 142), and in his noble speeches before parlament (Roll of Parliament, v 176, 183). The policy of peace which he pursued was just and wise, he foresaw its risk to himself.

Suffolk's wife, Alice, was widow of Thomas, earl of Salisbury, and granddaughter of Geoffrey Chaucer By her he had an only son John, second duke of Suffolk

SUFFOLK, an eastern county of England. Area 1,482 sq. miles Much of the county is formed by low hills, raing occasionally over 400 ft. They are a continuation of the Childers and they form the main watershed of the county. They consut of chalk, covered to the east by boulder clay, with glacial sand interspersed with patches of London clay, Pilocene deposits and alluvium. Alluvium also appears in the fens in the north-west. Subsidence has let the sea far mit to the land along the rivers.

Palaeolithic implements have been found in fair abundance in some of the gravels in the north-west of the county, less abundantly from there southward to the Stour and only sporadically in other parts of the county In Neolithic times the middle of the county with its boulder clays was probably for the most part forested, and this accounts for the fact that most of the artefacts of this age have been found on the higher chalk lands of the west and on the lighter soils near the coast especially in the north and south extremities of the county In other parts they are found generally along the river-valleys that are floored with gravel. A marked feature of pre-historic Suffolk is the number of beakerpots of the late Neolithic or early Metal age which have been found there. These have been found particularly around the estuaries of the Stour, Orwell and Deben, where presumably, the immigrants landed first It is thought that they then pushed up the rivers into the north-western part of the county and here a number of other beakers have been discovered. Bronze implements have been found in much the same places as the Neolithic, except that they are scarce in the north-east. In the centuries immediately preceding the Christian era Suffolk was invaded by Brythonic tribes, and traces of their handswork have been found here Along with Norfolk it formed part of the kingdom of the Iceni, and it was ravaged by the Romans after the unsuccessful revolt of Boudicca (Boadicea). The Roman road from Colchester to Venta Icenorum crossed the county from near Stratford St. Mary to Scole Just north of the Gipping this road threw out a branch in the direction of Dunwich, whence it led northwest again to cross the Waveney near Bungay. To the west there ran from north to south from Norfolk the continuation of the Peddar's way. The ancient track of the Icknield way ran along the chalk hills of the north-west. On the Suffolk coast the Romans built two forts to guard the Saxon shore-the first has left traces

SUFFOLK 521

at Burgh castle, the other, which was at Walton near Felixstowe, has been washed away by the sea,

The county of Suffolk (Sudfole, Suthfole) was formed from the south part of the kingdom of East Anglia which had been settled by the Angles in the latter half of the 5th century. The most important Anglo-Saxon settlements appear to have been made at Sudbury and Ipswich It suffered severely from the Danish incursions and after the treaty of Wedmore formed part of Danelaw The whole shire lay within the diocese of Dunwich, which was founded c 631. In 673 a new bishopric was estab lished at Elmham to comprise the whole of Norfolk which had formerly been included in the see of Dunwich. The latter came to an end with the incursion of the Danes, and on the revival of Christianity in this district Suffolk was included in the diocese of Ely. The county has now become part of the new diocese of St Edmundsbury and Ipswich. There were a number of religious houses in the county, and the most important remains are those of the great Benedictine abbey of Bury St. Edmunds, the college of Clare, originally a cell to the abbey of Bec in Normandy and afterwards to St. Peter's Westminster, converted into a college of secular canons in the reign of Henry VI. still retaining much of its ancient architecture, and now used as a boarding-school; the Decorated gateway of the Augustinian priory of Butley, and the remains of the Grey Friars monastery at Dunwich A peculiarity of the church architecture is the use of flint for purposes of ornamentation Another characteristic is the round towers, the principal examples being those of Little Saxham and Herringfleet, both Norman By far the greater proportion of the churches are Perpendicular, while the church of Long Melford should be mentioned on account of its remarkable Lady chapel Special features are the open roofs and woodwork and the fine fonts

The Normans built castles in the county at Eye and Walton, and there are remains of the entrenchments and part of the walls of Bungay, the ancient stronghold of the Bigods, the ruins of Mettingham, built in the reign of Edward III; Wingfield, surrounded by a deep moat, with the turret walls and the drawbridge still existing; the ruin of Framlingham, with high and massive walls, originally founded in the 6th century, but restored in the 12th, the outlines of the fortress of Clare castle, anciently the baronial residence of the earls of Clare, and the Norman keep of Orford castle Probably the establishment of Suffolk as a separate shire was scarcely completed before the Conquest, and although it was reckoned as distinct from Norfolk in the Domesday survey of 1086, the fiscal administration of Norfolk and Suffolk remained under one sheriff until 1575. The shire court was held at Ipswich, In 1086 Babergh was rated as two hundreds, Cosford, Ipswich and Parham as half hundreds, and Samford as a hundred and a half, Hoxne hundred was formerly known as Bishop's hundred and the vills which were included later in Thredling hundred were within Claydon hundred More than half the county was included in the ecclesiastical liberties of St Edmund and St. Aethelreda of Ely, and in these the king's writs did not run.

In 1173 the earl of Leicester landed at Walton with an army of Flemings and was joined by Hugh Bigod against Henry II Since 1290 the county was constantly represented in Parliament by two knights. In 1317 and the succeeding years a great part of the county was in arms for Thomas of Lancaster Queen Isabella and Mortimer having landed at Walton found all the district in their favour. In 1330 the county was raised to suppress the supporters of the earl of Kent; and again in 1381 there was a serious rising of the peasantry chiefly in the neighbourhood of Bury St. Edmunds. Although the county was for the most part Yorkist it took little part in the Wars of the Roses. In 1525 the artisans of the south strongly resisted Henry VIII's forced loan. It was from Suffolk that Mary drew the army which supported her claim to the throne. In the Civil Wars the county was for the most part parliamentarian, and joined the Association of the Eastern Counties. Within the county there are several interesting examples of domestic architecture of the reigns of Henry VIII and Elizabeth-Hengrave hall (c. 1530), near Bury

St Edmunds, Helmingham hall, surrounded by a moat crossed by a drawbridge and West Stow manor, with a fine gatehouse

The Reform bull of 1832 gave four members to Suffolk, at the time distranchising the boroughs of Dunwich, Ofrord and Aldeburgh. For parliamentary purposes the county constitutes five divisions, each returning one member, viz, Lowestoft division, Eye, Bury St. Edmunds, Sudbury and Woodbridge. Ipswich returns one member, and part of the borough of Great Yarmouth falls within the county.

Suffolk was enriy among the most populous of English counties. Fishing feets had left its ports to bromp back cod and ling from the carried on a trade with Planders From the yatum the carried on a trade with Planders From the yatum the product of the carried on a trade with Planders From the yatum the yatum the yatum that yatum that yatum the yatum that y

china factory flourished at Lowestoft.

In the 18th century Suffolk was famed for its dairy products, but the high price of grain during the wars of the French Revolution led to the breaking up of the pastures and it is now one of the principal grain-growing counties in England. In 1939 the acreage of land under crops and grass was 712,346 ac, of Which 499,373 ac were arable Barley is the chief grain cop with 119,987 ac, wheat next, 107,914 ac, and then oats with more than one-third the acreage of wheat. Mangolds, turnips and swedes occupied 19,724 ac and sugar beet 47,466 ac, Stiffelb being the greatest grower of this crop after Nortoik Beans and peas covered 38,003 ac. The acreage of clover and votation grasses for hay was 51,540 ac. Suffolk punch lorses are famous and the native bread other towns, while a large number of cattle are also fattened in the country. Sheep, usually a cross between the old Norfolk horned and the Southdown are neared on the dner soils, while large number of piezs are also bred.

The most important manufactures relate to agriculture They include that of agricultural implements, especially at 1 peach, Bury St Edmunds and Stownarket, and that of artificial mures at 1 pswich and Stownarket, for which coprolites are du, Malting is extensive, with small manufactures, including silk, cotton, linen, woollen and horschair and cocon out matting

The LN.E. railway serves the county Suffolk comprises 11 lundreds, and after 1888, for administrative purposes, was divided into East Suffolk (857 6 sq mn., excluding Ipswich), population (1938) 300,770, and West Suffolk (610 8 sq mi), population (1938) 102,390 Between Sept 1939 and Feb. 1941, however, the total population decreased 6% as a result of warinne evacuation. The following are the municipal broughs;

(1) EAST SUFFOLK. Aldeburgh, Beccles, Eye, Ipswich, a county borough and the county town, Lowestoft, Southwold.

(2) West Suffolk. Bury St. Edmunds, Sudbury.

There is one court of quarter sessions for the two administrative counties, which is usually held at Ipswitch for East Sutolk, and then by adjournment at Bury St. Edmunds for West Sutolk, and then by adjournment at Bury St. Edmunds in Sudbury have separate courts of quarter sessions. The county is in the docase of St. Edmundsbury and Ipswitch, except for the Rural Deanery of Lothingland, which is in the diocese of Norwich. The National Trust owned only 7 acres in this county in 1942.

SUFFREN SAINT TROPEZ, PIERRE ANDRÉ DE (1729-1788), French admiral, third son of the marquis de Saint Tropez, was born in the Château de Saint Canat (Aix) on July 17, The French navy and the Order of Malta offered the usual careers for the younger sons of noble families of the south of France who did not elect to go into the church Suffren entered the close and anstocratic corps of French naval officers as a "garde de la marine," the equivalent of a cadet or midshipman, in Oct 1743, in the "Solide," one of the line of battleships which took part in the confused engagement off Toulon in 1744 He was then in the "Pauline" in the squadron of M Macnémara on a cruise in the West Indies In 1746 he went through the duc D'Anville's disastrous expedition to retake Cape Breton, which was ruined by shipwreck and plague

Next year (1747) he was taken prisoner by Hawke in the action with the French convoy in the Bay of Biscay. When peace was made in 1748 he went to Malta to perform the cruses with the galleys of the Order of Malta technically called "caravans," a reminiscence of the days when the knights protected the pilgrims going from Saint Jean d'Acre to Jerusalem. In Suffren's time this service rarely went beyond a peaceful tour among the Greek islands During the Seven Years' War he was present as lieutenant in the "Orphée" in the action with Admiral Byng, which, if not properly speaking a victory, was at least not a defeat for the French, and was followed by the surrender of the English garrison of Minorca. In 1757 he was again taken prisoner, when his ship the "Océan" was captured by Boscawen oft Lagos On the return of peace in 1763 he intended again to do the service in the caravans which was required to qualify him to hold the high and lucrative posts of the Order He was, however, named to the command of the "Caméléon," a zebec-a vessel of mixed square and lateen rig peculiar to the Mediterranean-in which he cruised against the pirates of the Barbary coast Between 1767 and 1771 he performed his caravans, and was promoted from knight to commander of the Order. From that time till the beginning of the War of American Independence he commanded vessels in the squadron of evolution which the French government had established for the purpose of giving practice to its officers. His nerve and skill in handling his ship were highly commended by his chiefs.

In the years 1778 and 1779 he served with the squadron of D'Estaing (q.v.) on the coast of North America and in the West Indies. He led the line in the action with Admiral John Byron off Grenada, and his ship, the "Fantasque" (64), lost 62 men His letters to his admiral show that he strongly disapproved of D'Estaing's half-hearted methods. In 1780 he was captain of the "Zèle" (74), in the combined French and Spanish fleets which captured a great English convoy in the Atlantic. His candour towards his chief had done him no harm in the opinion of D'Estaing. It is said to have been largely by the advice of this admiral that Suffren was chosen to command a squadron of five ships of the line sent out to help the Dutch who had joined France and Spain to defend the Cape against an expected English attack, and then to go on to the East Indies.

He sailed from Brest on March 22 on the cruise which has made him unique among French admirals, and puts him in the

of his country during the last two wars, and which, as he knew. were due to had administration and timid leadership, had filled him with a burning desire to retrieve its honour. He was by experience as well as by temperament impatient with the formal manoeuvring of his colleagues, which aimed at preserving their own ships rather than at taking the English, and though he did not dream of restoring the French power in India, he did hope to gain some such success as would enable his country to make an honourable peace On April 16, 1781, he found the English expedition on its way to the Cape under the command of George Johnstone (1730-1787), at anchor in Porto Piaya, Cape Verde islands. Remembering how little respect Boscawen had shown for the neutrality of Portugal at Lagos, he attacked at once Though he was indifferently supported, he inflicted as much injury as he suffered, and proved to the English that in him they had to deal with an admiral of oute a different type from the Frenchmen they had been accustomed to He pushed on to the Cape, which he saved from capture by Johnstone, and then made his way to the fle de France (Mauritius), then held by the French D'Orves, his superior officer, died as the umted squadrons, now II sail of the line, were on their way to the Bay of Bengal,

The campaign, which Suffren now conducted against the English admiral Sir Edward Hughes (1720?-1794), is famous for the number and severity of the encounters between them Four actions took place in 1782 south of Madras (Feb 17), near Trincomalee (April 12), off Cuddalore (July 6), after which Suffren seized upon the anchorage of Trancomalee, compelling the small British garrison to surrender; and again off Trincomalee (Sept. 3). No ship was lost by the British in any of these actions, but none was taken by them Suffren attacked with unprecedented vigour on every occasion, and if he had not been ill-supported by some of his captains he would undoubtedly have gained a distinct victory As it was, he maintained his squadron without the help of a port to refit, and provided himself with an anchorage at Trincomalee.

His activity encouraged Hyder Ali, who was then at war with the company. He refused to return to the islands to escort the troops coming out under command of Bussy, maintaining that his proper purpose was to cripple the squadron of Sir Edward Hughes

During the northeast monsoon he would not go to the islands but refitted in the Malay ports in Sumatra, and returned with the southwest monsoon in 1783. Hyder Ali was dead, but Tippoo Sultan, his son, was still at war with the company Bussy arrived and landed. The operations on shore were slackly conducted by him, and Suffren was much hampered, but when he fought his last battle against Hughes (April 20, 1783), with fourteen ships to eighteen he forced the English admiral to retire to Madras, leaving the army then besieging Cuddalore in a very dangerous position

The arrival of the news that peace had been made in Europe put a stop to hostilities, and Suffren returned to France. While refitting at the Cape on his way home, several of the vessels also returning put in, and the captains waited on him Suffren said in one of his letters that their praise gave him more pleasure than any other compliment paid him,

In France he was received with enthusiasm, and an additional office of vice-admiral of France was created for him, He had been promoted baills in the Order of Malta during his absence He died on Dec. 8, 1788, when he was about to take command of a fleet collected in Brest. The official version of the cause of death was apoplexy, and as Suffren was a very corpulent man it appeared plausible Many years afterward, however, his body servant told Augustin Jal, the historiographer of the French navy, that he had been killed in a duel by the prince de Mirepoix The cause of the encounter, according to the servant, was that Suffren had refused in very strong language to use his influence to secure the restoration to the navy of two of the prince's relatives who had been dismissed for misconduct.

Suffren was crippled to a large extent by the want of loval and capable co-operation on the part of his captains, and the vehemence of his own temperament sometimes led him to disregard front rank of sea commanders. He was by nature even more prudence, yet he had an indefatigable energy, a wealth of resource, and a thorough understanding of the fact-so habitually disregarded by French naval officers-that success at sea is won by defeating an enemy and not by merely outmanoeuvring him, and this made him a most formidable enemy

The standard authority for the hie of Suffren is the Histoire du Bailt de Suffren by Ch Cuna (1854) The Journal de Bord du Bailt de Suffren Suffren Suffren Guerral (1854) The Journal de Bord du Bailt de Suffren dans l'Inde, edited by M Mores, was published in 1888 Thier is an appreciative study in Gaptain Mahan's The Influence of Sea Tower support History, 1600-173 (1690).

SÜFÜSM (tasawwuf) is formed from the Arabic word Sūfī, which was applied, in the 2nd century of Islam, to men or women who adopted an ascetic or quietistic way of life The word Sufi from suf (wool) refers to garments worn by such persons.

Mysticism in Islam goes back to Mohammed who, on one side of his nature, was an ascetic and in some degree a mystic Notwithstanding his condemnation of the solitary life and celibacy of Christian monkery, the example of the Hanifs, with some of whom he was acquainted, and of the Christian hermits made a deep impression on his mind and led him to preach the efficacy of ascetic exercises, such as prayer, vigils and fasting Again, while Allah is described in the Koran as the one God working his arbitrary will in unapproachable supremacy, other passages lay stress on his all-pervading presence and intimate relation to his creatures, eg, "Wherever ye turn, there is the face of Allah" (ii, 109), "We (God) are nearer to him (man) than his neck-vein" (l, 15). The germs of mysticism latent in Islam from the first were rapidly developed by the political, social and intellectual conditions which prevailed in the two centuries following the prophet's death Devastating civil wars, a ruthless military despotism caring only for the things of this would, Messianic hopes and presages, the luxury of the upper classes, the hard mechanical picty of the orthodox creed, the spread of rationalism and free thought, all induced a revolt toward asceticism, quietism, spiritual feeling and emotional faith Thousands, wearied and disgusted with worldly vanities, devoted themselves to God The terrors of hell, so vividly depicted in the Koran, awakened in them an intense consciousness of sin, which drove them to seek salvation in ascetic practices

Sūfiism was originally a practical religion, not a speculative system It arose, as Junayd of Baghdad says "from hunger and taking leave of the world and breaking familiar ties and renouncing what men deem good, not from disputation." The early Sufis were closely attached to the Muslim church. It is said that Abū Hāshim of Kūfa (d. before AD 800) founded a monastery for Sufis at Ramleh in Palestine, but such fraternities seem to have been exceptional. Many ascetics of this period used to wander from place to place, either alone or in small parties, sometimes living by alms and sometimes by their own labour. They took up and emphasized certain Koranic terms, such as dhikr (praise of God), consisting of recitation of the Koran, repetition of the Divine names and the like, and tawakkul (trust in God), now defined as renunciation of all personal initiative and volition,

leaving one's self entirely in God's hands. Quietism soon passed into mysticism. The attainment of salvation ceased to be the first object, and every aspiration was centred in the inward life of dying to self and living in God. Toward the end of the 2nd century the doctrine of mystical love was set forth in the savings of a female ascetic, Rābi'a of Basra, the first of a long line of saintly women who played an important role in the history of Suffism. Henceforward the use of symbolical expressions, borrowed from the vocabulary of love and wine, becomes increasingly frequent as a means of indicating holy mysteries which must not be divulged. This was not an unnecessary precaution, for in the course of the 3rd century, Sufiism assumed a new character. Side by side with the quietistic devotional mysticism of the early period there now sprang up a speculative and pantheistic movement which was essentially anti-Islamic and rapidly came into conflict with the orthodox ulemā. It is significant that the oldest representative of this tendency, Ma'rūf of Baghdad, was the son of Christian parents and a Persian by race. He defined Şūfīism as a theosophy and his aim was "to apprehend the Divine realities." A little later Abū Sulaiman al-Darani in Syria and Dhu'l-Nun in Egypt developed relation between God and the soul by glowing and fantastic alle-

the doctrine of gnosis (ma'rifat) through illumination and ecstasy The step to pantheism was first decisively taken by the Persian Abū Yazīd (Bāyezīd) of Bistām (d AD 874), who introduced the doctrine of annihilation (fand), ie, the passing away of individual consciousness in the will of God.

#### ITS EVOLUTION

In the evolution of Sūfīism, influences outside of Islam made themselves powerfully felt. Christian influence had its source, not in the church, but in the hermits and unorthodox sects, to whose ideal of unworldliness Suffism owed much. More than one Sūfī doctrine-that of tawakkul in particular-show traces of Christian teaching. The monastic strain which insinuated itself into Şüfüsm ın spite of Mohammed's prohibition was derived, partially at any rate, from Christianity But Buddhistic influence may also have been at work Buddhism flourished in Balkh, Transoxiana and Turkestan before the Mohammedan conquest, and in later times Buddhist monks carried their religious practices and philosophy among the Muslims who had settled in these countries. The use of rosaries, the doctrine of fanā, which is probably a form of Nirvana, and the system of "stations" (maqāmāt) on the road thereto, would seem to be Buddhistic in their origin. The third great foreign influence on Suffism is the Neoplatonic philosophy Between Ap 800 and 860 the tide of Greek learning, then at its height, streamed into Islam The so-called "Theology of Austotle," which was translated into Arabic about AD 840, is full of Neoplatonic theories, and the mystical writings of the pseudo-Dionysius were widely known throughout western Asia. It is not mere coincidence that the doctrine of gnosis was first worked out in detail by the Egyptian Şūfī, Dhu'l-Nun (d. AD 859), for Suffism on its theosophical side was largely a product of Alexandrian speculation

By the end of the 3rd century Sufi mysticism was fast becoming an organized system, with rules of discipline and devotion which the novice was bound to learn from his spiritual director, to whose guidance he submitted himself absolutely, as to one regarded as being in intimate communion with God At the head of these directors stood a mysterious personage called the Outb (Axis); on the hierarchy of saints over which he presided the whole order of the universe was believed to depend. During the next two hundred years (A.D. 900-1100), various manuals of theory and practice were compiled the Kuāb al Luma' by Abū Naṣr al-Sarrāj, the Qüt al-Qulüb by Abū Tālib al-Makkī, the Risāla of Qushairī, the Persian Kashi al-Mahjūb by 'Alī ibn 'Uthmān al-Hujwīrī, and the famous Ihyā by Ghazālī. They all expatiate on the discipline of the soul and describe the process of purgation which it must undergo before entering on the contemplative life. The traveller journeying towards God passes through a series of ascending "stations", in the oldest extant treatise these are (1) repentance, (2) abstinence, (3) renunciation, (4) poverty, (5) patience, (6) trust in God, (7) acquiescence in the will of God After the "stations" comes a parallel scale of "states" of spiritual feeling (ahwāl), such as fear, hope, love, etc., leading up to contemplation (mushāhadat) and intuition (yaqīn). It only remained to provide Sūfīism with a metaphysical basis, and to reconcile it with orthodox Islam. The double task was finally accomplished by Ghazālī (q.v). He made Islamic theology mystical, and since his time the revelation (kashf) of the mystic has taken its place beside tradition (nagl) and reason ('agl) as a source and fundamental principle of the faith,

## MANY SHADES OF OPINION

The Sūfis comprise many shades of opinion-from asceticism and quietism to pantheism. The pantheistic type which prevails in Persia throws the transcendental and visionary aspects of Suffism into undue relief, as in the sayings attributed to Bayezid (d. A D 874), e.g., "I am the winedrinker and the wine and the cup-bearer"; "I went from God to God, until they cried from me in me, 'O Thou I.'" The peculiar imagery which distinguishes the poetry of the Persian Sūfis was developed by Abū Sa'id ibn Abi'l-Khair (d AD, 1049) in his quatrains which express the

SUGAR 524

gones of earthly love, beauty and intoxication Henceforward, the great poets of Persia, with few exceptions, adopted this symbolic language The whole doctrine of Peisian Suffism is expounded in the celebrated Mathnawi of Jalal-uddin Rumi (q v) but in a discursive and unscientific manner, its leading principles

may be stated briefly as follows God is the sole reality (al-Hagg) and is above all names and definitions. He is not only absolute being, but also absolute good, and therefore absolute beauty. It is the nature of beauty to desire manifestation, the phenomenal universe is the result of this desire, according to the famous tradition in which God says, "I was a hidden treasure, and I desired to be known, so I created the creatures in order that I might be known" As things can be known only through their opposites, being can only be known through not-being, wherein as in a mirror being is reflected; and this reflection is the phenomenal universe, which accordingly has no more reality than a shadow cast by the sun

The Sufi theosophy as it appears in Persian and Turkish poetry tends to abolish the distinction between good and evilthe latter is nothing but an aspect of not-being and has no real existence-and it leads to the deification of the hierophant who can say, like Husain b Mansur al-Haliāj, "I am the Truth" Sūfī fraternities, hving in a convent under the direction of a shaykh, became widely spread before AD 1100 and gave rise to dervish orders, most of which indulge in the practice of exciting ecstasy by music, dancing, drugs and various kinds of hypnotic suggestion (see DERVISH).

Suggestion (see Derivish).

Bilintomarium—The foremost authority is R. A. Nicholson, whose writing: (Selected Poems from the Divini Shamis Tabriz, translated with an introduction, etc. (Cambridge, 1894); Barguny Concerning the lation of the Kaihf al-Mahjab, the Oldest Person Treatse on Shim Incomo, 1911, Sinders in Islame, Mysteam (Cambridge, 1911), The Idea of Personality in Shimis (Cambridge, 1921), coperate with its more popular testies The Mysteas of Islam (London) capter with its more popular testies The Mysteas of Islam (London). 1914]) have caused most previous works to have merely an anti-quarian interest. He also published the text and translation of The Mathnawi of Jaldiu dain Rámi (Books 1 and 11, London, 1925, 1926) An excellent introduction to the study of Islamic mysticism is given An excellent introduction to the study of Islamic mysticism is given in TE | W (bib) History of Demon Peetry, 1 as 3 arg (London, mr. SUGAR. Though sugar did not become a major carbohydrate food until the 19th century, even neolithic man found its sweet taste palatable. In prehistoric and classical periods some fruits and honey apparently were the major sweet foods. The present major source, sugar cane, is beheved to have originated in the South Pacific or Monsoon Asia It has been widely distributed for at least two or three millenniums, but seems to have arrived in the Mediterranean part of Europe relatively late, perhaps with the Arabs after 4 D. 636. As late as the 14th century its product was a scarce luxury in the western world. The beet, now a second major source, was known as a sweetish vegetable during the middle ages, but was not known as a source of crystalline sugar until late in the 18th century. In some areas, the coco palm, the aloe, the maples and the sorghums, as well as some other plants have served as minor but locally important sources of sweetish foods or sugars. Technologists have learned to convert starch, particularly those of grains, to glucose by treatment with dilute acid.

While the name "sugar" was originally applied to the sweet, crystalline substance, sucrose, derived from the sugar-cane plant, its meaning was broadened to cover many organic compounds of somewhat similar construction. Gathering energy from sunlight by means of their chlorophyll, green plants make sugars out of carbon dioxide and water, such as sucrose or its components, glucose and fructose. By condensing several molecules of glucose into one large molecule, many plants make starch; and by combining one molecule of glucose with one molecule of fructose, many plants make the compound sugar, sucrose, which is the true sugar of commerce. Glucose, fructose, starch and sucrose are all important constituents of the human diet. Starch, sucrose and fructose re-

vert to glucose in the course of digestion and assimilation. The relative sweetness of fructose, sucrose and glucose is as 17 to 7 Crystalline sucrose, the familiar table sugar, is derived on a commercial scale from the juices of the sugar cane and the sugar beet.

#### SUGAR CANE

The sugar cane is a giant perennial grass producing clumps of solid prominently jointed stalks, each bearing two ranks of swordshaped but gracefully arching leaves Diverse varieties of sugar cane are grown in the widely separated sugar-cane regions of the world Some of these produce stalks only ½ in in diameter, while others make stalks up to 3 in in diameter. Leaves vary in width as the stalks do in diameter Stalks of all possible colours may be found, but those in red, vellow, purple and green predominate Varieties with striped stalks are not uncommon Well-developed stalks reach 10 to 20 ft in length, but stalks 42 ft, long have been measured While some sugar cane plants produce real seeds, these are never used for renewing commercial cultures, the cane growers planting and replanting their fields with pieces of stalks These pieces or cuttings are usually placed lengthwise in furrows and lightly covered with soil A proper cutting includes several joints,

COURTESY, MAMAIIAN PLANTERS ASSOCIATION FIG 1 -- PORTION OF CANE STALK (CUTTING) SUCH AS IS USED FOR DIANTING

each of which bears a dormant eve or bud Under favourable conditions, the eyes on a cutting sprout within a few days after planting, each sprout developing roots at its base and growing into a new plant New shoots spring up from the stubble after a crop of sugar cane has been cut, so it is customary in most sugar-cane growing regions to harvest several crops from a field before it is replanted

Sugar cane grows to best advantage on a rich, moist soil under sunny skies in a fronical climate A uniform high temperature. strong sunlight and frequent showers during the growing season are desirable. Winter frosts may do much damage in marginal areas The cane likes plenty of water and is a voracious feeder, responding quickly when plant foods are applied to

the soil about its roots

Cultural practices are designed to meet local conditions Rainfall is a major factor and makes for nonirrigated or irrigated types of agriculture which have different costs and result in different yields of sugar per acre Heavy, rugged equipment is required to prepare the soil Plowing is usually deep, but a fine-surfaced seedhed is not essential Cuttings or seed pieces 12 to 24 in long, cut from the upper ends of stalks, are placed end-to-end in rows spaced 4 to 6 ft apart and covered with soil 2 to 4 in deep. Plantings can be made at any time when suitable soil temperature and moisture are obtained.

Subsequent cultivation is primarily for weed control. Maximum cane yields depend on the maintenance of an adequate soil moisture supply from either rainfall or artificial irrigation. The crop transpires an enormous amount of water while growing, and irrigation records show crops requiring as many as 3,000,000 gal. (more than 100 in per acre) annually for maximum growth Also, since the crops remove large amounts of plant nutrients from the soils, a permanent soil fertility is maintained through heavy applications of fertilizers. A carefully controlled technique determines what, how much and when fertilizer is needed

A field of sugar cane ready for harvesting will consist of many primary stalks and subsequent tillers. If the crop is a heavy one, some of these will be erect, but many will be recumbent. Harvesting takes place at from 8 to 30 months after the crop is started The length of time in which a crop can be grown depends upon the SUGAR 525

suspension of normal growth and makes early harvesting neces-

In Australia, Florida, Louisiana and Hawau considerable progress has been made in developing cane harvesting machinery, but in most countries sugar cane is still harvested by hand, the stalks being chopped off at or near the surface of the ground and cut up into suitable lengths for convenient handling by men who wield sharp knives especially designed for the purpose. Harvested cane is conveyed from the field to the factory by the methods most conveniently and economically employed on each plantation some plantations all of the cane is transported on animal-drawn carts and wagons, on others these have been replaced by motor trucks, while on many of the larger and more modern plantations the cane stalks are loaded onto cars and hauled over railroad tracks by locomotives On some plantations situated on mountain slopes. the cane is transported in streams of water diverted at a high elevation from a river and conducted through the fields in a series of flumes into which the cane stalks are thrown These flumes converge at the factory and deliver the cane directly to the crushing

Yields as high as six and seven tons of cane stalks per acre per month of growing time have been harvested, and in the better sugar producing regions somewhat more than a half ton of sugar per acre per month of age at harvest has frequently been recovered

Sugar Cane Breeding.—The genus Saccharum to which sugar cane belongs includes wild as well as cultivated forms. Saccharum robustum, one of the wild species, grows in profusion in the New Guinea region. In appearance, it resembles closely certain of the cultivated sugar canes, but lacks the juiciness and the high successe content of the latter. A more slender wild relative, Saccharum spontaneum, is widely distributed throughout India, Malaya, the Philippines and the East Indian archipelago Like S robustum, it is pithy and contains little sucrose

The sweet, juicy, domesticated types are apparently unable to perpetuate themselves in the wild It seems probable that they owe their origin and development to chance mutation and perhaps also to hybridization among the wild species, followed by long continued selection and propagation at the hand of man

Both cultivated and wild forms of sugar cane come into flower under the influence of shortening days—in the northern hemisphere from September to December, in the southern hemisphere from March to June The "tassel" or "arrow" is a handsome plumelike panicle which bears many hundreds of small spikelets The seed when seen under magnification, resembles a grain of wheat in miniature, it is so small that nearly 100 sugar-cane seeds would be required to equal the weight of a single wheat grain

In 1858, J W Parris, a planter in Barbados, succeeded in growing to maturity sugar-cane seedlings which had germinated along the borders of a field of sugar cane which had flowered profusely. However, this achievement was not widely publicized and was soon forgotten When, in 1888, J B. Harrison and J. R Bovell in Barbados and, independently, F. Soltwedel in Java reported success in their attempts to grow seedlings of sugar cane, their findings were hailed as a new discovery, affording opportunities to create new cane varieties of exceptional ment.

In Java, interest in sugar-cane breeding was stimulated from the beginning by the occurrence of disease epidemics among the existing varieties which emphasized the need for new diseaseresistant types Resistant varieties were imported from India and elsewhere, and were hybridized with the local varieties. A wild Javanese cane was also found to be disease resistant and was subsequently used extensively as a parent in crosses with the sweet but susceptible cultivated varieties.

Sugar-cane breeding became an important function of experiment stations in many cane-growing countries. New varieties were developed which far surpassed the old varieties in vigour, disease resistance and yield of sucrose. These superior varieties are, for the most part, complex hybrids in which have been combined the desirable qualities of many parent strains.

Insect Pests of Sugar Cane.-There are many insect pests of sugar cane. Several species of moth borers badly damage cane in-

duration of favourable growing conditions, cold weather causes Louisiana, the West Indies, South America, Mexico, India, Java and the Philippines The giant moth borer (Castnia licoides) is particularly destructive in Trinidad and the Guianas The frog hopper (Tomaspis saccharina) is an important pest in Trinidad In Australia, heavy losses are caused by the white grubs of several species of Scarabaeid beetles. Other species of the same family are sugar-cane pests in the Philippines, Java, Mauritius and the West Indies Another conspicuous pest of sugar cane in the Malay archipelago and in Formosa is the woolly aphis (Oregma Sap-sucking leat hoppers of the genus Pyrilla are lanigera) especially inturious in India

Very little can be done to control these pests, except by biological or natural methods In Hawan, this method has been applied with great success, where about a dozen different insect pests at-tack sugar cane. These include a leaf hopper (Perkinsiella saccharicida), a beetle borer (Rhabdocnemis obscura), a root grub (Anomala orientalis), a leaf roller (Omiodes accepta), an aphis (Aphis sacchari), two army worms (Laphygma exempta and Cirblus unibuncta), two species of mealy bugs, an oriental grasshopper, a mole cricket and a bud worm Most are of oriental, Malayan or South Pacific origin Satisfactory control of them was permanently effected following a thorough study and importation of the beneficial insects found naturally operating on them in their home countries.

Sugar Cane Diseases .- The sugar-cane plant is attacked by many diseases, a number of which may cause serious losses Crop damage by disease depends principally on the susceptibility of the variety grown and existing environmental conditions A disease of major importance in one country may be of minor importance in another.

Sereh disease (cause unknown) in Java once caused great reductions in sugar yield, yet with new varieties it became of little significance Gumming disease (Bacterium vasculorum) has exacted heavy tolls on sugar yields in Brazil, Australia, Fiji, Mauritius and the West Indies Leaf scald (Phytomonas rubrilineans) occurs in Fiji, Australia, Philippines, Java and Hawaii and has, at times, caused severe losses Fui disease (a virus) has greatly reduced sugar yields in Fiji, Australia and the Philippines. Mosaic, a serious virus disease, has at one time or another become epidemic in almost every sugar-cane country of the world; in some instances the absolute failure of the industry was averted only by resorting to resistant varieties. Other major cane diseases are eyespot (Helminthosporium sacchari), Pythium root rot (Pythium arrhenomanes), smut (Ustilago sacchari), chlorotic streak (cause unknown), and red rot (Colletotrichum falcatum)

The physiological diseases (nonparasitic) caused by unfavourable environmental factors such as climatic conditions, physical nature and chemical composition of the soil, are often responsible for unsatisfactory sugar yields.

Sugar-cane diseases have been most effectively controlled through the development of resistant varieties by breeding and selection. The application of fungicides as dusts and sprays has

FIG. 2.-ANCIENT STONE-ROLLER CANE MILL

been of little or no value in the control of cane diseases Rigid Larger factories have two complete tandems and a few have three quarantines governing the interchange of cane cuttings and seed has aided greatly in preventing the spread of cane diseases

Cane Juice Extraction.-The earliest cane mills consisted of two vertical tollers (fig 2) of wood or stone, geared to a long lever or sweep and turned by hand or animal power The cane stalks were fed into the narrow opening between the rollers, but only a small amount of the total juice in the cane was extracted This type of mill was followed by two rollers set horizontally one above the other and later by the three-roller mill (fig. 3) with two bottom rollers and a top roller. By means of pinion gears fitted to extensions of the shafts of each roller, the power that turns the top roller is transmitted by the pinions to the two lower rollers, so that the three rollers rotate slowly at the same speed The cane feed enters the mill between the top and front, or feed, roller and emerges between the top and back, or discharge, roller, thus receiving two separate crushings in each three-roller unit, the juice from each of these units flowing into separate receivers

Modern mill roller sizes range from 34 in. to 37 in in diameter and 78 in to 84 in in length and have suitable surface and juice grooves cut into their surfaces to improve their grip on the feed and allow easy drainage of the juice They have from 21 to 31 r.p.m. with surface speeds of 25 to 30 ft. per minute.

Hydraulic pressure from an accumulator is applied to jacks acting downwardly on each end of the top roller, which is free to move vertically, thus exerting a heavy pressure on the feed of crushed cane passing between the rollers. The top roller thus floats on the cane blanket, changing its vertical position slightly with changes in thickness of the blanket, under a pressure of 70 to 80 tons per foot of its length or a total pressure of 500 to 550 tons. A modern tworoller unit with coarse grooves is known as a crusher, and a coarse grooved three-roller unit set at the head of a train of mills is also called a crusher.

Cane milling plants in modern factories consist of the slat carrier upon which the cane is unloaded from the cars or trucks, one or two sets of knives along the carrier to act as levellers to compact the feed, a crusher or a double crusher (two two-roller units), and then four to six units of three-roller mills in tandem, with suitable bagasse conveyors between each unit of the train. In some factories a shredder of the high-speed revolving-hammer type is placed between the crusher and the three-roller mills to disintegrate the cane further A conveyor then carries the fibrous residue or final bagasse to the boiler furnaces or to storage This bagasse usually supplies an excess of fuel for normal steam requirements

tandems, crushing up to 6,000 or more tons of cane in 24 hours,

To facilitate extraction of the sugar-containing juice of the cane, the bagasse on the conveyor before entering the last mill unit receives and absorbs a spraying of very hot water equal to one-fourth or one-third the original weight of the cane (see fig. 3). This system of dilution is known as compound imbibition, in which the last mill juice, which includes the water, is returned and absorbed in the bagasse entering the next to last mill This resulting dilute juice is again returned to the bagasse blanket before the next earlier unit and is repeated until all mills except the first three-roller unit receive bagasse containing diluted juice. The combined juice of the crusher, first and second mills flows into a single receiving tank, and this mixed fuice is pumped to the boiling house If compound clarification is practised (see below), the mill juices are divided; the crusher with first mill juice (undiluted) is primary juice and the second mill juice containing all the dilute juices is secondary juice. The percentage of sucrose extracted in modern milling plants ranges from 96 to as high as 99 and varies with the amount of field trash and soil accompanying the cane, and with the tonnage rate, number of mill units, hydraulic pressures, dilution used and the skill of the engineering staff The final bagasse contains from 38% to 45% water, from 1% to 4% sucrose, about 50% fibre and around 2% ash. Fresh bagasse, as burned, has a fuel value of 2,700 to 3,000 British thermal units (B.T U.) per pound and on a dry, ash-free basis about 8,300 B T.U per pound.

The strained mixed juice from the milling plant contains from .2% to nearly 1% suspended matter, is of dark brown colour, full of air bubbles and acid in reaction with a pH of 4 5 to 5.4. The density range is 12% to 14% dissolved solids, sucrose 10% to 12% and purity (sucrose per cent solids) 80 to 86; these figures vary greatly in different localities. There are small percentages of glucose, fructose, organic acids, ash, nitrogen compounds, pectin, gum and colouring matters The suspended matter consists of held soil, bits of cane fibre and a small amount of cane wax. The crushed cane residue, bagasse or megasse is used as fuel under the boilers, as wall board and, more potentially than actually, as cellulose for paper.

# THE SUGAR BEET

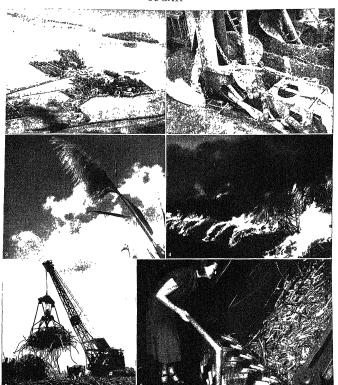

The beet, Beta vulgaris, long used as a garden vegetable and for cattle fodder, was not prized for its sugar content until a full half century after the discovery in 1747 by A S. Marggraf that the sugar in beet juice was the

same as that in cane Experimental and promotional work by Franz Carl Achard about 1799 in which the king of Prussia became interested and work by J. P. B. Delessert was followed by a decree by Napoleon that 70,000 ac be planted to beets as soon as possible Meanwhile the development of the White Silesian beetroot, from which all modern strains have come, was carried on by Moritz von Koppy. By 1840 the sugar beet provided about tion and by 1880 exceeded cane as a producer, in which leading position it remained in most years until World War I.

The sugar beet has a wide range in the temperate mid-latitudes but sugar content develops best in areas with moderate summer temperatures averaging 63° F. to 73° F. for the three summer months and with welldistributed growing-season rain-

#### SUGAR-GROWING IN HAWAII

- 1. A typical U.S. super community in the level. In a vectate tisted of super such as the super such in the center sound which community in the redition read it are the red-free homes of worker. Pleanting the croc One salats are cut into their pieces and dropped into furrows, usually from a big machine which feeds the "seed-lings" suchematically.

- 5. The "grab" harvester, which breaks off the sugar oene stalks at ground level and lifts them onto trucks. Not all farms, however, transport cane stalks to the mill in trucks. Some use a system of flumes in which running water carries the canes others have their own rail-roads, and still others employ a system of overhead trollegs.
- 6 Stalts, washed and out into small precess entering the mill. This state roller grinds the jutes exit the states. Another cleaning perantion treats the julos, which is then bolled until crystals form. When the crystals are separated from the molesses, they form "raw" supar, which is put in bags and sent to the mainland United States for refining.

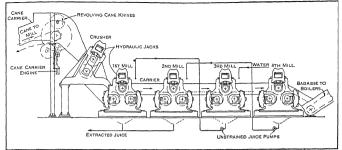

PLAIE 11 SUGAR

# REFINING SUGAR

- Opening bags of "raw" sugar as they enter the refinery. The brown crystals are about 97% pure in "raw" form.
- The sugar is washed again at the refinery, in centrifugal machines which throw off more impurities. This operation brings the sugar to a purity of about 99 4 %
- The sugar, still in signed form, is next filtered through klessiguhr, a special form of earth that removes more of the small amount of impurities attil remaining
- 4, Large char filters, where still another cleaning operation takes place.
- Here, liquid sugar is filtered through charcoal to make it water-white 5 The liquid sugar is boiled once more in tall vacuum pans until it is again crystallized Small, dry "seed" is mixed into the liquid to start the crystals forming
- 6 When the crystals have formed, the sugar is screened into various sizes Most common of these is table sugar, shown being packaged into convenient cartons for household use
- 7 Specialty sugars such as crystal tablets are cut from blocks of sugar. Cube sugar is moulded and dried into shape

SUGAR 52'

COUNTEST, HONOLULU INON WORKS

FIG 3 -CANE MILLING PLANT

fall, unless irrigation is practised In the United States it is most favoured by conditions on the northern margin of the Corn Belt Soils should be fertile, deep, well drained and without hardpan, for the plant is a deep-roated one.

Production, shown in Table I, is predominantly European, a result more perhaps of national policies than of favourable natural conditions. Three areas are outstanding, the Kiev and Podolia section of southwestern U S S.R., the Magdeburg area of Germany

and the chairy plains of northern France

Growing and Harvesting the Beet,-Sugar-beet seed must be sown each year to produce the annual beet crop. Since 1942 not whole seed but treated seed has been largely used the treatment consisting of removal of corky outer layers, reduction to uniform size and in the number of seed germs per unit and treatment with fungicides and insect repellents. The time of planting depends on the weather and area but is mostly done in the spring. The seedbed is care-Planting is in rows spaced 12 to 28 in apart fully prepared and in some areas will have been prepared for irrigation as well. The stand in the row is later thinned, or blocked by hand hoe or mechanically so that the young beet plants are spaced about 10 in apart in the row, giving a density of as many as 30,000 to 40,000 plants per acre Weeds must be severely controlled with hoe, cultivator or chemical spray. Fertilizer is applied to the seedbed or as a side dressing. In all except humid areas irrigation is generally practised, amounting to as much as 30 in of water in dry areas; each plant may require as much as 20 gal of water during its growth. Harvesting, formerly done by hand but now considerably mechanized in some areas, consists of a process whereby each beet is lifted and topped Topping consists of cutting away a top layer of the beet and the attached leaves which are used for livestock feed, being almost as nutritious as alfalfa hay The decapitated roots are then picked up, perhaps mechanically after windrowing, and hauled by truck or wagon, depending on the area, to the receiving station of a beet sugar factory if one is near, or to a concentration station for shipment to a more distant factory. There the beets are stored in piles 15 to 20 ft high and more than 100 ft. wide, with perhaps controlled ventilation and protection against freezing The accumulation of such a stockpile is necessary to prolong the processing season much

beyond the short harvest season.

Beet Seed Production.—The breeding of the sugar beet and the production of high-grade seed is a scientific story in liself. Much of the research, hybridization and multiplication of desirable strains had been carried on in Europe, though the U.S. moved forward in that respect particularly after the 1930s. The seed beets are taken in from the field over whiter and tested for surar bearing the production of the second production of the

qualities, the desirable ones are replanted in the spring, so that seed may be harvested in the late summer or autumn of the second year. Trade in sugar beet seed has been an important part of world seed trade.

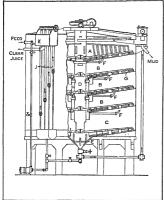

Insect Pests and Diseases.—About 40 insects cause economic damage to the sugar beet. The best webworm causes damage ove wide areas unless controlled with DDT, arsenucals or some other new compounds. The best army worm and others are destructive but may be controlled by ditching and the use of crude oil. Wire worms may be controlled by ditching and the use of crude oil. Wire worms may be controlled by fungaturity the soil with ethylene dibrounde and by DDT. The crown borer causes damage in the west. Things, munng files, several kinds of bestelles and grashop pers damage the leaves; nematodes, centupedes and cutworms are sometimes destructive.

Seedings may be damaged or destroyed by damping off or bled too fungs and several other organisms. Foliage may be sevel other organisms. Foliage may be sevel damaged by curly top, a wirus disease carried by a small leafhopper Leafspot is a most serious disease in the middle west, mossic and mildew take a toll in some areas at times. Root rots, if conditions frayour them, may cause surmicant loss

Juice Extraction.—As the beets are flumed into the factory they may carry some dirt, small stones and other field trait them. These beets are fed, through a series of trash- and stone cathers, into a tumbling washer for removal of adhering dirt. It cleaned beets are then weighed and delivered to the sheing ma chines.

Unlike sugar cane, which is crushed to extract the juice, sugar beets are slaced with a minimum rupture of plant cells. This procedure permits later extraction of the juice (by diffusion through the walls of the plant cells) in a higher degree of purity tha would be obtainable from crushed beets. The first operation is the extraction of the juice is slicing the beets. The modern sice is a revolving drum with a series of inwardly slanting groove knives forming part of its perpihery. The beets are fed into the drum and the V-shaped chips or cossettes (which somewhat ru the semble sheestring potatoes) cut from them are discharged from toutside of the drum, and conveyed to the diffusion battery for indice extraction.

This diffusion battery consists of an endless connected seruof 10 to 14 vertical cylindrical tanks (commonly called celleach fitted with top and bottom doors and having a capacity of two to five toos each. Inside of each cell is a network of loochains to hold the cossettes from packang too ughtly in the ce-Between each cell and the next in the sense is a heater for mai taining the temperature of the extracted juice, together with nece sary pipes, valves and fittings. This endless chain of cells is som 528 SUGAR

times arranged as a circular, sometimes as a straight, battery. The operation of the battery is relatively simple. To start operation any cell in the battery is filled with the sheed beets, or cossettes. That cell is closed and hot water is introduced until all voids are filled.

While the first cell is being filled with water, the next cell is being filled with cosesters, and when this latter cell is closed it is connected to the first cell, and so on around the series. In this fashion hot water enters any chosen unit, leaches or diffuses sugar from the contained best cossettes, and this solution proceeds, through a heater, into the next filled unit. The water always enters the oldest or earliest filled unit of the water always enters the oldest or earliest filled unit of the most recently filled one. This solution of sugar, called away lunce, which leaves the that within the plant cells of the newly sheet best, and is periodically withdrawn, through a measuring device, for purification and sugar recovery.

At the end of a specified extraction period, the exhausted cossettes are discharged from the oldest, or exhausted, unit, and the hot water supply transferred to the next unit in the series. This empty unit is then refilled and becomes the newest unit.

The diffusion battery is thus an endless chain of units or cells, within which hot water is passed over sliced beets, starting with nearly exhausted cossettes and moving progressively over cossettes of increasing sugar content, and from which the resulting raw juice is periodically withdrawn.

By-Products.—Beet pulp, either moist or dried, perhaps mixed with molasses, is used as a livestock food. Pulp drymg is highly developed, and pellelizing is done with some of the material to meet specialized requirements of sheep feeders. The wet pulp is stored in also until used. Several kinds of waste may be processed particularly to recover glutamic acid and other amino acids when it proves to be commercially feesible to do so.

### THE MANUFACTURE OF SUGAR

The early stages of the manufacture of sugar are carried on in the general area of the production of sugar cane or beets. The later stages, particularly the refining, is much more likely to be carried on in port areas near great consuming populations.

Chemical Treatment of the Juice.—This discussion will be pointed particularly to the treatment of cane junce but beet junce treatment differs only in details. As part of the dissolved non-sugars are colloidal (see Collotos), the junce must undergo some form of chemical treatment before it can be filtered satisfactorily. The natural acidity of the junce must also be neutralized, because sucrose decomposes on heating with the acid junces, the sucrose combining with water and breaking up into two simpler sugars, ellucose and furctose, as shown in the equation.

Sucrose Glucose Fructose  $C_{12}H_{22}O_{11}+H_2O=C_6H_{12}O_6+C_6H_{12}O_6$ 

This is termed inversion of sucrose, and the resulting mixture of glucose and fructose is termed invert sugar.

The object of chemical treatment is fourfold (1) to neutralize the natural acidity (as just explained), (2) to remove suspended impurities, thus rendering the juice transparent; (3) to precipitate dissolved nonsugars, thus increasing the purity of the juice and (4) to decolourize the juice in the manufacture of white

The chemical agents used are quicklime (CaO), usually added in the form of hime cream or mik (CaO(H)), sulphut donde gas (SO<sub>2</sub>); carbon dioxide gas (CO<sub>2</sub>), and, occasionally, hisphoride gas (SO<sub>2</sub>); carbon dioxide gas (CO<sub>2</sub>), and, occasionally, phosphorie acid (HgPO<sub>2</sub>). The effect of these chiemical agents is completed by heating the juice to the boiling point in an appraatus called a junce beater, the juice being pumped at high speed through several series of long brass tubes, heated externally by low-pressure steam or evaporator "vapour" Certain impurities, pieveously dissolved in the juice, are thus rendered insoluble and form a dark coloured precipitate which occludes most of the colloidal material and which can be separated from the juice in various ways. (1) bley, forming a scum which can be removed by skimming ladles, (2) by allowing it to subside (after separation of the air) and removing it as a sediment, (3) by filtration through cloth or other filtering media; (4) by centrifugal action.

In the manufacture of raw sugar, a dilute milk of lime solution of ro's to  $x \ge 8 \operatorname{rns}$  (o's Baumel) to facilitate control of the reaction, is mixed with the juice to approximately  $p \pi 8$  o whits sequivalent to about  $z \parallel b$  of available CaO per ton of came The mixture is heated to the boiling point and discharged into continuous clariners or into settling tanks (subsiders or clautiers), each holding  $z_{\rm coo}$  and  $z_{\rm$ 

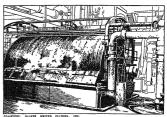

FIG. 5.-ROTARY DRUM FILTER

SUGAR 529

juces and more compact settlings. If compound clarification is practised, the high density and high purity primary juce and the lower density, lower purity secondary juce are clarified separately through continuous clarifiers. The latter juce is then reclarified by mixing with the juce fed to the primary lentifier and the primary settlings mixed and resettled with the secondary juce in the secondary in the seco

The settlings, in modern practice, are filtered by rotary drum vacuum filters (see fig. 3) of large capacity and high efficiency. The older practice was through filter presses (see Fittraviros) Clear, settled junce and the clear portion of the filtered junce mixed and passed to the multiple-effect evaporatoi (described below)

In the manufacture of white sugar, a more thorough punification of the junce is essential Two methods are used acid sulphitation and carbonation. In the former, from 4 to 5 gal of lime cream about 27 Brix (15° Baumé) are added per 1,000 gal of junce, and sufficient sulphur dioxide gas to precipitate this lime, with the formation of a granulal precipitate of calcium sulphite (CaSOs), as shown in the equation

### $CaO + SO_0 = CaSO_0$

The gas may be added either before or after himing, the final result being the same The juice is then heated and subsided

The diffusion juice of the sugar beet is purified by a process known as carbonation. This consists essentially in defecation of the hot raw juice with either milk of lime or a saccharate-of-lime milk followed by precipitation of this lime by a gas rich in carbon dioxide obtained from the factory limekiln. The amount of lime used is around 3 % of the weight of the beets sliced. By this treatment much of the colloidal and other impurities are removed with the precipitated carbonate of lime. This carbonation procedure is customarily conducted in two stages, with an intermediate removal of the first precipitate. Such divided procedure prevents possible resolution of some of the first-precipitated impurities, which would occur if the process were conducted in only one stage Removal of the precipitated impurities from both the first and second carbonation processes is accomplished by filtration or analogous means, commonly by a combination of settling and filtration The clarified juice from these carbonation procedures is then customarily treated with sulphur dioxide gas in order to bleach some of the residual colouring matters and to remove small remaining amounts of lime This treatment is again tollowed by filtration, vielding a pale yellow solution of sugar known as thin

Formerly the juice was carbonated in batches. An important mprovement was the adoption of continuous carbonation whereby the juice, lime and gas are all introduced continuously into the carbonator, and the treated juice is removed continuously. This procedure results in a more uniform preceptate than did the older methods and permits use of settling devices instead of filters for separating much on the precipitation.

Evaporation of Water.—A large quantity of water must be evaporated from the purified juice before the dissolved success can begin to crystallize. To avoid destruction of sucrose at high temperatures the juice is biolical inclosed vessels under vacuum, thus lowering the boiling point. Further, in order to economize fuel, multiple-effect evaporators are used.

Fig. 6 is a sectional view of a double-effect evaporator with an enlarged first offect, for vapour beating of mixed junce and boiling vacuum pans at certain stages. The general principles are the same with three or more effects, and vapour can be removed from any effect except the last for junce heating. The lower part of each vessel contains numerous vertical brass tubes, their open ends passing through perforations in two horizontal plates. The space between these plates forms a steam drum having a centre well open at each end, a steam inlet and condensate drain. The centre well encrease evaporator capacity by causing rapid crutation of the juice up through the tubes and down the well. The large space above the drum in silled with steam or vapous generated by the boiling juice. Steam entering the drum of No 1 condenses on the exterior of the tubes, transmitting its latent heat to

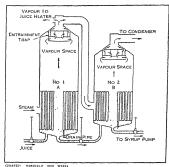

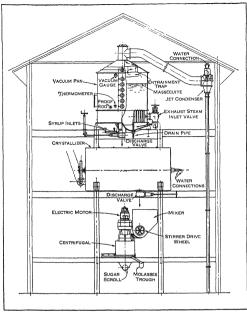

FIG 6 -- DOUBLE EFFECT EVAPORATOR

the june inside the tubes and causing it to boil. A portion of the vapour this generated is extracted for "extra" use, and the remainder passes to the steam drum of No 2 and there acts in the same manner as in No 1. The vapour generated here by the boiling junce passes to a "jet" condenser which does not require an air pump, and maintains a vacuum of 25 to 26 in in the list effect which in this instance is No 2. This vacuum fixes the boiling point of the junce then, the temperature at which vapour (leaving No. 2) can condense on the tubes in No. 2, and the presence of that vapour and the beling point of the junce in No. 7 Consequently, the high vacuum and tow boiling point in No. 2 promises of the value of the vacuum and tow boiling point in No. 2 promises of the value of the vacuum and tow boiling point in No. 3 promises of the value of the vacuum and tow boiling point of the junce in No. 2 promises of the value of the vacuum and the value of the value

In fig. 6 the level of the boiling juuce in No 2 is maintained constant at B by drawing in junce from No. 1, similarly, the level in No 1 is maintained constant at A by drawing in juuce from so, acternal supply tank. At the same time, concentrated juuce or syrup, is drawn off continuously from No. 2 by a pump, and at such a rate that the density of the syrup in No. 2 and of that drawn off remains constant at between 60° and 65° Brix (3.2° and 35° Baumé). This syrup contains about 60%, of dissolved solid (including sucrose). It is, therefore, an unsaturated solution, free from crystals.

Crystallization of the Syrup.—The final stage of evaporation, accompanied by the crystallization of the syrup, is carried out in vacuum pans. This apparatus is shown in fig. 7 Part of the interior, the steam or vapour-heated tubes forming the "clandrap," centre well and cone bottom are shown on the right. Above and to the ight, is the jet condenser (shown in section) wherein the vapour generated by the boiling syrup is condensed by a sense of water jets. A vacuum of about 26 in is maintained inside the pain by the suction of the condenser, thereby lowering the boiling point of the syrup to about 130° F. Cane and best sugar factories are equipped with three or more pans, each discharging from 1 to to 3 tons, or more, of crystals after each boiling operation is com-

Sufficient syrup is first drawn into the pan to occupy only a part of its total capacity, and steam is admitted to the calandran which is covered by the syrup After a period of rapid boiling, the syrup becomes superstaurated and microscopic crystals form to form. This is called the graining point. It is important to produce a sufficient quantity of gains as rapidly as possible in order

COUNTESY, HONOLULU IRON WORKS
FIG. 7 —CROSS SECTION THROUGH RAW SUGAR BOILING-HOUSE

that the crystals may be of nearly uniform size during all stages of growth. To obtain a more rapid formation of grain in a minimum of time, shocking is commonly employed by introducing into the supersaturated syrup, just prior to the natural graming point, a few ounces of powdered white sugar. The number of grain introduced is immaterial: they induce formation of new crystals. Hardischer grain by either method, the operator stops to formation of new crystals by quickly reducing the supersaturation with a little water or a quantity of insaturated syrup from the supply tank. The boiling then proceeds on syrup with either intermittent or set feed, holding the amount of supersaturation within narrow limits, causing the previously formed grain to grow until the nan is filled.

The boiling time for high purity syrup is from 3 to 4 hours, and 8 to 12 hours for the lowest purity products. To make a largegramed final product, the operator starts crystal growth with a relatively small quantity of grain, thereby increasing the rate of growth of each grain. Conversely, to make a small-granod final product, he, starts with a larger quantity of grain, thereby reducing the rate of growth of seck prain.

The time available for growth can be extended by transferring half the contents of a full pan to a second, empty pan, the two

halves then being boiled simultane. ously with further additions of syrup to each, causing continuous growth of the original grain until both pans are filled During the process of boiling, the operator is guided by the appearance of small samples of the crystallized syrup which he removes from the pan at short intervals by means of a proof The samples are spread stack upon a sheet of glass and examined by transmitted light from a When the pan is full, the mixture of crystals and mother liquor (called massecuite) is finally concentrated until it contains from 0% to 11% of water It is then semifluid and contains about 65% by weight of crystals and 35% of mother liquor Air is now admitted to the pan, the bottom gate opened and the massecuite discharged There are several boiling-control devices in use They operate by control of vacuum, elevation of boiling point (massecuite temperature above water temperature) and electrical conductivity, and are either automatic or of vis-

ual aid to the pan operator The mother liquor separated in the centrifugals, described below, contains a high percentage of sucrose It is reboiled in the vacuum pan where it crystallizes, forming second-grade massecuite This 19 treated in the centrifugals, where it separates into second-grade crystals and second-grade mother liquor. The last is reboiled in the vacuum pan to form third-grade or final massecuite which is discharged into large cylindrical crystallizers, each fitted with a slowly rotating central shaft carrying water coils or pipes of ample surface ratio, which control the massecuite temperature and act as

surrers. Fig. 8 shows one of several types for rapid cooling of high-density masscure to a pre-determined minimum temperature, such as zeo F, holding it at this temperature for a time interval with warm water, then releating with warmer water to a predetermined optimum saturation temperature. This reduces the sucrose content and purity of the final mother liquer or final molasses to a much lower minimum and in far less time than by the older type of air-cooled crystaller. The final massecute is purged at its original high density in modern high-speed centrifugals running 1,800 to 2,200 r.pm (see fig. 7 and 9). Molasses true purities (sucrose per cent true solids) of 30 to 33 are obtainable. Besides sucrose and reducing sugar it contains various organic and inorganic impurities derived from the original cane highs.

To save time and fuel, it is a common custom to grain, usually by shocking, only the final massecutus. The purged final crystalls are mixed with syrup to a heavy magma and used for seeding the two higher grade massecuties. The first two grades produce as usuar, and any third-grade sugar not required for seed is melted and returned to process in one of the high-grade pans.

Separation of Crystals from Mother Liquor.—This operation, called curing or purging the sugar, is effected by centrifugal action in a number of machines operating simultaneously. Each SUGAR 529B

(fig 9) consists of a vertical metal basket or drum which is suspended on a central vertical spindle and for high grades is rotated at speeds of 1,200 to 1,400 rpm, low grades, 1,800 to 2,200 The cylindrical wall of the basket is made of perforated steel plate and litted with an inner lining of brass wire, a-in mesh screen, over which is fitted a very finely perforated round-hole or slotted screen After the basket is set in motion, a charge of massecuite enters through a central opening at the top, and centrifugal action forces the massecuite against the perforated lining which acts as a strainer, allowing the fluid mother liquor to pass through but retaining the crystals The second grade is washed with a few pints of warm water to improve purging Separation in first and second grades is complete in about two minutes, but the lowest grade requires a much longer time. Fig. 7 shows positions of vacuum pan, crystallizer used for final massecuite, massecuite mixer, centrifugals and scroll conveyor for the sugar

In the manufacture of raw sugar, the above treatment yelds crystals containing from 96% to 98% of sucross and, inversely with the sucrose, should not contain over 1 o% to 0.5% of water, to avoid detenoitation in storage. The colour, mosture and adour of this sugar are largely due to residual mother liquor adhering to the crystals, which cannot be completely separated by centrifugial action alone. The conveyer carries the sugar from the centrifugials to a storage bin from which the sugar gravitates through chutes and weighing machines into bags or into bulk sugar storage awaiting shipment in bags or bulk form to the refinery.

In the manufacture of direct process white sugar, the separation of the mother luquor is carried much further by spaying a large quantity of water over the layer of sugar in the centrifugal basket while rotating at full speed. Former practices of repurging the sugar in a second set of centrifugals and of spraying sugar with bluing water, to concate yellowish timt, were largely abandoned with improvements in the technique of manufacture. After passing through a rotary direct the dry white sugar contains from 99.5% to 99.9% of sucrose

Desugarization of Molasses .- After all possible sugar has been crystallized from the purified beet juices, there remains an end product, molasses, containing about 50% sugar Since the molasses produced in a factory may retain 15% to 20% of the sugar of the ouginal beets, many factories recover this sugar by a special desugarization process which consists essentially of the following steps finely powdered quicklime is added to chilled diluted molasses and combines with most of its sugar to form an insoluble saccharate of lime This precipitate is filtered off; most of the molasses impurities remain in the filtrate from which small additional amounts of saccharate may be recovered by heating it, The saccharate is mixed with factory sweet waters to form a saccharate milk which is then introduced into the carbonators in place of the milk of lime usually added at that point. The carbon dioxide gas, added here, breaks up the lime-sugar combination releasing the sugar which is recovered in the usual operations of the factory. This method of desugarization is known as the Steffen lime process, after its inventor Carl Steffen, and is much used in the United States Plants for the desugarization of beet molasses by means of baryta, or of strontia, are in operation in a few localifres.

cahties. (H L LN; A.A. BI; M. H SL, J K. R.)

Refining of Raw Sugar.—The objects of refining raw cane
sugar are to remove impurities and to prepare the pure sugar in

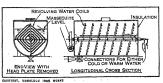

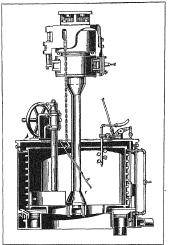

FIG. B .- TEMPERATURE CONTROLLED CRYSTALLIZER

COURTESY WESTERN STATES MACHINE CO
FIG 9 -SUGAR CENTRIFUGAL BASKET SECTION

the various forms required by consumers.

The cane sugar refining process consists essentially of three principal operations: (1) removing adhering molasses from the aw sugar crystals and melting the crystals in it water to form a solution, (2) filtering and decolourizing the solution; and (3) re-crystallizing the sugar from the decolourized solution.

Disabung or Melling the Rese Suger—In modern practice, dissolving is usually accomplished in three steps, the first two of which are for the purpose of eliminating at least 19% of the impurities which accompany the raw sugar. First, the raw sugar is mingled with a hot syrup, previously removed from mw sugar, to form a magma which is fed into centrifugal machines Second, the magma is spun in the centrifugals to remove the syrup, and the crystals are sprayed with water to wash off adhering molasses. Third, the washed raw sugar is discharged from the centrifugals and is dissolved in hot water to produce what is termed washed raw sugar liquor.

The minging, washing and separation of washed sugar crystals from the syrup constitute what is called the affination process, and he resulting syrup is known as affination syrup or wash syrup. This process results in the production, from 100 tons of raw sugar (90% sucrose), of about 85 tons of washed raw sugar crystals (90% sucrose) and about 15 tons of dissolved solids (85% sucrose and 15% impurities) in the affination syrup.

The washed raw sugar is melted in large cylindrical melting anks with hot water or, preferably, with high-purity, low-density sweet water, a by-product resulting from other refinery operations. The melting tanks are usually capable of holding from 5 to 10 tons of sugar together with the necessary quantity of solvent to give a washed raw sugar liquor containing 60% to 65% sugar in solution. Tanks are equipped with mechanical stirrers, per-

forated steam coils for heating and the necessary facilities for regulating the density and temperature of the liquor, which properties have an important bearing upon the effectiveness of the subsequent filtration process

The affination syrup is handled separately, its impurities eventually being eliminated by recrystallization of its sucrose

Filtering and Decolourizing the Liquor -The washed raw sugar liquor ranges from light brown to dark brown in colour and contains variable amounts of insoluble impurities in suspension These impurities are removed by forcing the liquor under pressure through cotton or metal cloth in leaf filters or filter presses (see FILTRATION), this apparatus having almost entirely supplanted the old style bag filters A small quantity of filter aid is regularly added to the liquor to maintain satisfactory flow rate and clarity of filtrate The filter and most commonly employed is diatomaceous earth, or kieselguhr, although a small amount of paper pulp is also used This filter aid forms a porous layer upon the cloth of the filter leaves or plates, and the suspended impurities entering with the liquor are retained in this layer as the house passes through under pressure. The filtered liquor is transparent but has a colour that may range from straw to brown, depending upon the character of the raw sugar being processed Kieselguhr filter aid is generally discarded after use, but in some

<sup>\*</sup>Centrifugal sugar, as distinguished from no roduced by the centrifugal process, which is

refineries is regenerated by the application of heat in a kiln, where the organic impurities removed from the liquor are burned out Removal of similar impurities from used paper pulp is accomplished by thorough washing with hot water in pulp washers

Decolourization of the filtered liquor is accomplished in most refineries by its percolation at a relatively slow rate through a deep bed of bone char in char filters-large cylindrical vessels. usually of cast iron, measuring from 15 to 50 ft in height and from 4 to 10 ft in diameter. Each filter is fitted at the top with a door for the admission of the bone char and with one or more similar doors near the bottom for the removal of the used chair A perforated metal false bottom, which is carefully covered with a specially woven cloth blanket before each filling, supports the column of char. An inlet pine is provided at the top for admission of the liquor to be decolourized, while an outlet pipe is connected to the filter bottom for the efflux of the decolourized liquor

In operation, a filter is filled to the top either with dry char or a mixture of char and houor, then filtered washed raw sugar liquor is admitted through the inlet pipe The rate of liquor flow is regulated by a valve in the outlet pipe. Upon completing its flow through the char, the decolourized liquor passes, by way of an extension of the outlet pine, to a hour classification and distribution gallery, commonly termed the liquor gallery. There the liquors from the various char filters are segregated according to quality and are directed to the proper places for further processing

Following a specified period of washed raw sugar liquor filtration, lower purity syrups resulting from other phases of the refining process are applied to the char for decolourization, in order to utilize the maximum decolourizing ability of the char. This causes the appearance of colour in the effluent, which is then directed to the second-liquor tank and, subsequently, upon the appearance of still more colour, may be directed to a third-liquor tank

After several hours, the decolourizing power of the char begins to deteriorate, because of the cumulative effect of the colouring matter and soluble impurities adsorbed from the liquor. At a predetermined point, the syrup supply is shut off and hot water is applied in its place This water displaces the syrup remaining in the char and gradually dilutes it, producing what is termed sweet water The operation is known as sweetening off the char. When the sugar content of the sweet water has fallen to a fraction of 1%, the effluent is run to waste and the flow of hot water through the char is continued for several hours in order to wash from it the maximum possible quantity of impurities Following this, the char is removed from the filter, sent to a drier and thence to a char kiln where it is heated to a high temperature, this burns off some of the organic matter and restores the decolourizing ability of the char, thus rendering it fit for reuse As this cycle of operations is repeated over and over, the char suffers gradual deterioration because of the cumulative effects of imperfect regeneration and of attrition due to handling. Consequently, it is common practice to maintain a policy of periodical discard of spent char and addition of new char.

Some refining has been carried on by the use of activated vegetable carbons which decolourize liquors by adsorption, and also by the use of certain chemical compounds which liberate nascent chlorine and have a bleaching action

Crystallization - The colourless and slightly coloured liquors are then recrystallized by boiling in vacuum pans which are heated by steam and within which a rather high vacuum is maintained by means of suitable condensers and vacuum pumps. The vacuum pans are equipped with the necessary facilities for control of sugar crystal formation and growth, so that at the completion of a boiling period the crystals discharged from a pan are of the proper size to meet the trade requirements for the particular type of sugar under production

The massecute discharged from a vacuum pan upon completion of boiling is a mixture of crystals and mother liquor or syrup. This massecuite is then directed to centrifugal machines in which the syrup is separated from the crystals and the crystals are sprayed with water to remove all possible traces of syrup from their surfaces. In this operation the purity of the crystals is

tde. Years shown are for crop years; generally the harvesting so baths of the year shown or in the eatly months of the following tie augat producing countries in the southers bemisphere, such auritus, Union of South Africa, etc., where the season begins

"Succept fugal sugar no-folds all types of sugar produced by other than the entiring of the sugar produced by other than the enteringed. The estimates molides such thrush known as piloncills, passels, perpices, chancers, the sugar produced by 
raised to about 99 9% sucrose. The syrup is reboiled two or three times in order to secure maximum sucrose extraction before returning it to char for further decolourization Magnetic filtration by an 10n exchange process gives promise of displacing this technique The moist white sugar leaving the centrifugals is carried by conveyers to sugar driers in which the moisture content of the sugar is reduced, by means of a current of hot air, to a very small fraction of 1% The granulated sugar drier, or granulator, consists of a large revolving cylindrical drum, the axis of which is slightly inclined from the horizontal. The interior is fitted with a number of narrow longitudinal shelves which alternately lift. the sugar and shower it down through the current of heated air as the drum revolves

From the driers the dried sugar passes to sets of vibrating or gyrating screens which remove undestrable coarse particles and dust and classify the sugar into the sizes demanded by the trade. The sifted sugar is then spouted to bins, from which it is drawn into automatic weighing and filling machines. The modern refinery is equipped with many such machines, designed to pack a wide variety of types and sizes of containers, generally ranging from 1-lb, paperboard cartons to 100-lb cloth or paper bags and, to a limited extent, 300- to 350-lb barrels.

The several varieties of cube, loaf and tablet sugars are prepared

of heavy white sugar syrup The resulting moist magma is then pressed or moulded in various types of machines in which either pressure or centrifugal force 18 utilized to produce moist cubes, tablets or slabs These moist forms are dried in hot-air ovens. where the sugar in the binding syrup crystallizes, thus bonding together rigidly all the crystals in the cube, tablet or slab. Cubes and moulded tablets are packed directly after drying. Loaf sugar and chipped tablets are produced either by direct cutting of the slabs with special chipping knives or by first sawing the slabs into bars and then chipping the bars as desired

made from granulated sugar by grinding in various types of attrition mills or impact pulverizers. In some cases the pulverized material is also passed through bolting cloth before packing

Soft, or brown, sugars are boiled from specially selected, darkcoloured, char-filtered liquors which result from the char filtration of affination syrup. Soft sugars are not washed in the centrifugals, but are allowed to retain a certain amount of syrup on the crystals, the quantity of syrup retained is regulated by the centrifuging process to give the desired sugar colour Soft sugars are characterized by very small crystal size which gives them a soft, spongy texture, and by their colour and pleasing flavour

Various grades of edible syrups are prepared by blending lightand dark-coloured char-filtered liquors and syrups to meet desired specifications

By-products,-By-products of a sugar refinery are restricted to: (1) a relatively small amount of molasses which is usually fermented for the production of alcohol or used in the manufacture of cattle food and (2) the discarded spent bone char; which is used as poultry feed or as fertilizer and soil conditioner (A H Hn, X.)

## PRODUCTION, TRADE AND PRICES

Cane sugar can be and is produced in nearly all tropical areas and beet sugar in many temperate countries Beet sugar makes up roughly one-third of the total (see Table II) and is primarily a product of Europe, the U S.S R and the United States Caribbean America is outstanding in centrifugal cane-sugar production, whereas India and Pakistan contribute nearly three-fourths of the less highly refined type of cane sugar Because of intimate relationship with war areas, the beet sugar production, which was slightly in excess of cane sugar production as late as 1912 was hard hit twice during the next 40 years, whereas cane-sugar pro-duction suffered no such hazards. Both generally had an upward trend but cane sugar greatly increased its margin over beet-sugar production

Comprehensive information on heet-sugar production in the United States is shown in Table IV and cane sugar production for continental United States and territories supplying the United States in Table V Information on production of miscellaneous sugars is harder to obtain However, such harvests are not insignificant locally. The palm-sugar season as a village or forest industry in some areas lasts about four months during which time a yield of as much as 40 to 80 lbs. of raw sugar is obtained per tree, or more than one ton per acre The yield of the long-used maple yard of northeastern United States, though highly variable from season to season, averages about 3 lb per tree but may go as high as 20 lbs.

Following World War I, sugar was uncommonly scarce and prices very high This encouraged restoration and expansion of beet-sugar production, and national self-sufficiency became the by mixing specially boiled white sugar with a controlled amount order of the day. Cane sugar areas, too, increased production

partly because of favourable prices but also because of new cane varaetes and the availability of new venture capital So, after 1927, until the outbreak of World War II, there was world overproduction of sugar in relation to effective demand. Stocks cumulated, the carry-over in 1929, for example, was 9,000,000 tons Attempts at finding a solution, some of which will be discussed presently, were generally unsuccessful. In the years just before World War II, consumption was approximately equal to production, yet the world price for unprotected raw sugar was about one cent ner pound.

The war changed all that; production was interrupted in some areas, trade was badly disrupted, and rationing became general in many major consuming countries. The Sugar Committee of the Combuned Food Board, membership consusting of the Unted States, Great Britain and Canada, reviewed the supply and distribution in the free world Production at the war's end was the smallest in relation to requirements in 25 years. The International Emergency Food committee indicated that available supplies would provide that all claimant countries could receive only about 70% of prewar consumption

One of the outstanding developments in the world food picture after World War II was the raph recovery of sugar production. As the sugar supply situation began to relax somewhat in 1947 and prospects for the new rora papeared favourable, the International Emergency Food council first notified importing countries that they might exceed previously recommended allocations; then late in 1947 allocation recommendations were discontinued on sugar. Though demand continued strong, production expanded to new record levels and outbreak of the Korean war in 1950 did not result in a shortage of supplies or any major price changes.

Approximately one-thard of the world's sugar enters international trade. Cuba is the major exporter whereas the United States, western Europe and Japan are major importers. In very large part, this is cane sugar; even before World War II the trade in beet sugar was small, mostly from Poland and Czechoslowkia. The economic and political problems of the sugar industry, such as high overhead costs, regional specialization and one-trop economies, technological obsolescence and multiple competition—on only between countries but between cane and beet production, and perfectned arrangements have noticeably affected trade even perfectned arrangement perfect of the sugar intering world trade is "freet" sugar, not regulated by bulletral or preferent

Intergovernmental attempts to solve some of the problems of sugar have been in evidence for nearly 100 years, beginning with a convention signed by four western Buropean countries in 1864. Acter major events were the Brussels Sugar convention of 1902, tile International Sugar agreement of 1931 (including the Chadbourne agreement) and the International Sugar agreement of 1937,

later extended Some students concluded that these agreements were sought as an instrument for maintaining the market position of the lowest cost producers, an exceptional situation

The 1931 International Sugar agreement, something between an intergovernmental commercial treaty and a private cartel, was an undertaking by exporter countries to set export quotas and to allocate the American market It finally lapsed in 1935 The International Sugar agreement of 1937 was signed by 21 countries, only to remain largely moperative because of World War II It provided for delineation of the free market, set export quotas and introduced some flexibility whereby export quotas might be gradually reduced if necessary

Cuba as the major exporter, first in the 1920s and again in 1952, attempted to bring the surplus situation under control by requiring reduction in its own production and setting part of the surplus up as a reserve to be deliberately marketed over several years instead of forced on the depressed market

In 1953, the British Commonwealth Sugar agreement was extended through 1960, increasing the negotiated price to an equivalent of 5 29 cents per pound

Governmental programs and policies have been much concerned with sugar, somewhat as regards production (particularly beet usugar), but more often with control of trade, processing and sale of the refined product. Beginning in the 17th century differential tanffs as between raw and refined sugar tended to add the growth of a sugar refining industry in western Europe Revenue traffs, drawbacks, export subsidies, quotas, licences, rationing and price fixing were all explored and used. Some details may be noted for one country

In the United States the precedent of raising federal revenues by taxing sugar was set in 7.5% with a sugar tantf. The industry from 1865 to 1920 was protected by direct subady and by tarify and during war periods was rather 1920ly controlled. Tariff duties on sugar were modified 14 times between 1897 and the 1930s, reaching a high during the 1930-34 period of 2 cents per pound on Cuba 96° sugar and 2 5 cents per pound on sugar from other countries. In 1048 the duty on Cuban sugar was set at 0 5 cent per pound and in June 1951 the duty was made 625 cents per pound on sugar from other countries.

The Jones-Costigan, act of 1935 provided for a processing tax on sugar and gave the secretary of agriculture power to estimate consumption needs and allocate quotas to four groups of producing areas. Benefit payments and the tax were declared unconstitutional in 1936, but the quota provisions were extended and included in the Sugar act of 1937. That law established a per-

Source: Sugar Statistics, vol. 1, pp. 38-57, Production and Marketing Association, U.S. Department of Agriculture (Washington, June 1983).

centage quota of 55 9% of estimated requirements, but not less than 3.715,000 short tons, for domestic sugar producing areas, including United States territories Suspension reinstatement and extensions followed during and after World War II The Sugar act of 1948 (as amended and extended in 1951) differed from that of 1937 in that it established fixed, instead of percentage, quotas of 1,800,000 short tons raw value for domestic beet areas, 500,000 tons for mainland cane, 1 052 000 tons for Hawaii 1,080,000 tons for Puerto Rico and 12,000 tons for the Virgin Islands The Philippine quota was set at 952,000 short tons of commercial sugar Additional amounts needed to meet consumption estimates would be allocated, o6% to Cuba and 4% to full duty countries, with provision for supplemental allocation of short falls Also the steps whereby the secretary determines annual requirements of sugar consumers were rather fully spelled out These determinations langed between 7,000,000 and 8,700,000 tons, and were sometimes amended during most consuming years.

Trade in sugar is so largely under agreement of one sort or another that a true world price is difficult to define. The price of 96° nw sugar f ob. Cuba is an approximation. When transportation and duty are taken into account the world price is sometimes above and sometimes less than the raw sugar prices at New York Markets in both spot sugar and futures are available in New York and spot markets are maintained in most producing countries.

Studies indicate that the elasticity of demand for sugar is low and has remained fairly constant from period to period. A reduction in price of 1% tends to be accompanied by an increase of 0.3% to 0.4% in consumption, with some tendency for the demand curve to shift downward after the early 1920s.

Consumption and Cookery.—Sugar priovides a high energy value per unit of weight (about 1,79¢ kilocalorise per pound) in addition to providing a degree of sweetness that is highly valuable for improving the palatability of other foods. Furthermore, by virtue of other important properties, sugar serves as a preservative agent for other foods (e.g., int., iriti products) and also provides a physical basis for fabrication of various food products (e.g., confectionery). It is also valuable for making desirable modification in the properties of food products, such as controlling teature and relection of medisters, as in the halfing mediatry. Finally, continued to the control of 
The requirements for sugar in the diet of virtually all peoplehave been better met as a result of constant increases in production which have permitted sugar to be removed gradually from the class of a medicine and an expensive luxury and allowing the to become established as one of the more economical sources of nourishment for the human body.

Relatively little sugar, particularly in the high-consuming counters, is consumed directly and by lixelf, though the population of such countries may obtain one-suth or more of their total calories from that food. Instead, it is used to increase nutritive value and to impart a satisfaction to the taste of a long list of other foods and beverages. In the United States of an annual average consumption of about 95 lb per person something like half is used directly in the home of in restaurants, and the remander is first processed with other foods or drinks. Table VI indicates a general breakdown in respect to United States consumption

In other countries wide variations in the amount of sugar consumed have been reported. The variations are associated with changes and differences in the level of national income, the retail prices established for sugar, the general standard of living, living conditions in the country, etc.

As sugar is an important soluble carbohydrate and is easily assoluble, it is valuable in the diet. Candy contains a high proportion of sugar (or glucose), but no dish for the table should do so. In adding sugar to fruit, more is needed if it is cooked with the fruit than if added when the cooking is completed.

Cane and beet sugars (sucrose) are the principal sugars used in cookery. They dissolve in one-third their own bulk of cold water, and in a smaller amount of hot water. Their melting point is

320° F If cooled at that point, they become barley sugar; if cooked beyond that point they become burnt sugar or caramel

Fine granulated or cator sugar is generally used in cookery, For icings, menngues and whisps, prowdered or pulverized (icing) sugar as used, the finest form being confectioners' sugar. All granulates to collect and sirtled fine before using These sagars are all pure white refined products. Brown and yellow sugars, which are produced by evaporation, are also used in cookery when there is no objection to a dark colour, and some of them have a delicious flavour. They vary in both colour and flavour, the best known being Demerara or coffee sugar, and dark hown or Barbadess sugar.

Other sugars such as glucose are less sweet than sucrose, and the commercial form is chaeper. It is used in many manufactured candies, jams and syrups to economize, but is not much used in the home. Commercial grape sugar is a dextose Maple sugar (sucrose) is much prized for its special flavour, but is made in comparatively small quantity, as is also palm sugar. Ame is a Japanese sweetening material that contains dextrin and maltose. Saccham is not a sugar, and has no food value, but it is very sweet and is sometimes substituted for sugar, usually on a physical's order.

Caramel or burnt sugar is marketed ready prepared, for use as "browning" for sauces, gravues, stews and the like, and also as flavouring in such dishes as caramel custard (custard with caramel below or around it). It can be prepared at home by melting granulated sugar in a saucean over a low fire, with constant stirring

It may be used at once as it is, or after removing from the fire, boiling water (d. cup water to r cup sugar) may be added very slowly, again with constant stirring Return this mixture to the hre and cook to a rich dark brown (eight to ten minutes) This hardens on standing, but can be melted over hot water. SUGAR-BIRD, the English name commonly given in the West Indian Islands to birds of the genus Certhiols (belonging to the Passerine family Coerobidae) for their habit of frequenting the cumpg-houses where sugar is kept, attracted thither by the lifes In their figure and motions they resemble a nuthatch, while their colouration—black, yellow, olive, gray and white—recalls a titmouse.

SUGER (c. 1081-1151), French ecclesustic, statesman and historian, was born of poor parents either in Flanders, at St Denis near Parus or at Toury in Beauce. About 1091 he entered the abbey of St Denis Until about 1104 he was educated at the priory of St. Denis de l'Estrée and there first met his pupil, King Louis VI. From 1104-06 Suger attended another school, perhaps that attached to the abbey of St. Benoit-suc-loite. In 1106 he became secretary to the abbot of St. Denis In 1107 he was made proved of Remeal in Normandy, and in 1100 of Toury.

provost of Berneval in Normandy, and in 1100 of Toury. In 1178 he was sent by Louis VI to the court of Pops Gelasius II at Maguelome and lived from 121-22 at the court of his successor, Calktus II. On his return from Italy Suger was appointed abbot of St. Denis In 1137 he accompaned the future king, Louis VII, into Aquitaine on the occasion of that prime's marriage to Eleanor of Aquitane, and during the second crusade was one of the regents of the kingdom (1147-49). He was bitterly opposed to the king's divorce, having himself advised the marriage. Although he disapproved of the second crusade, at the time of his death, on Jan, 31, 1315, he was preaching a new crusade

Suger was the friend and counsellor both of Louis VI and Louis VII. He urged the king to destroy the feudal bandits, was responsible for the royal tactics in dealing with the communal movements and endeavoured to regularize the administration of

justice. He left his abbey, which possessed considerable property, enriched and embellished by the construction of a new church built in the nascent Gothic style

Suger was generally considered to be the foremost historian of bis day. He wrote a panegyric on Lous VI (Vist Ludous: regus), and contributed to Historia gloriou regis Ludovici (Louis VII). In his Liber do rebus in administratione sua gestis, and its supplement, Libellius de consecratione ecclesiae S. Dionysin, he treats of the improvements he had made to St. Denis, describes the tiessure of the church and gives an account of the rebuilding Suger's works served to imbue the monks of St. Denis with a taste for history, frequently resulting in quasi-official chronicles.

SUGGESTION, as popularly used, involves psychologically two features the stimulus, or suggestion in the strict sense, and suggestibility, or susceptibility to response Technically, then, suggestion is the stimulus to induce, by words or gestures, then, attitudes and verball or overt responses in another without his recourse to logical argument or critical analysis Suggestibility refers to the form and content of the inner readness—often taking the nature of attitudes—to accept a suggestion uncritically.

The origin and operation of the suggestion-suggestibility component of the personality lie distinctly in the self-other or interactional processes. Within this frame of reference both heterosuggestion, or stimulation by another, and autosuggestion fall into a common larger category Autosuggestion can be understood in terms of role taking, the individual subvocally, or by other imagery, stimulates himself to some kand of response

Suggestion and suggestibility, moreover, should not be confused with imitation (q, v) with which they are obviously allied. The two former fall within the area of stimuli and inner readmess to react, the latter has its proper emphasis in action itself.

The function of suggestion and suggestibility in perception was early recognized as various studies in visual and auditory illusions showed. Later the relation of suggestion and suggestibility to social perception was indicated. The former tends to emphisize the passivity and uncriticalniess of the respondent, the latter, the effects of the disposition of the individual to see and respond to objects in terms of his psychodynamic history.

Heterosuggeston may be divided into prestige and nonprestige categories. The latter is illustrated in the use of sensory-perceptual stimuli of a material or social sort in which there is no appeal to status or authority. Such are the classic experiments on judgments of the length of lines and lifted weights, presented in such a way as to constitute suggestions of graded differences, not necessarily present in all instances. (A. Bintet, 1900. C. Bird, 1940.) In the field of mass behaviour, the suggestion effects of large numbers of persons which induce in the individual participant a sense of power and the "impression of universality" is another example. (F. H. Allport, 1924.)

Suggestions may be either direct or mdirect. In the former, the recipient is aware of the intention of the speaker, performer, printed matter or other stimulus, and often the suggestion effect is carried by emotional appeals, manner of presentation or other devices which lead to uncritical acceptance. In indirect suggestion the aim and the source—person or institution—emain hidden Indirect suggestion is the size quanton of veiled propaganda. (See also Pseuchology)

Prestige suggestion is the better known because it is so widely used. A speaker may easily sway an audience because of his great name; people flock to the cinema, or view television, to see and hear a famous motion-picture star though the drama is second-rate; eminent men in nuclear physics win attention for some of their political views because of their pight status as scientists. A number of experiments have shown that even faulty statements allegedly held by experts in contradiction to views held by the general public have the greater influence on listeners. Vet the general public have the greater influence on listeners. Vet the greater in the positive or negative. In reactive to such stimuli, one tends to be either all for a given suggestion or all against it. (G.H. Estabrooks, 1920.)

The reason for the potency of prestige suggestions is the conditioning in deference to authority and high status which begins in the parent-child relations This training is reinforced as one grows up in a world of class and other group differences in which

the struggle for power is so important
Hypnosis is largely an extreme form of prestige suggestion in
which the inner symbolic checks are blocked and the action system

which the inner symbolic checks are blocked and the action system of the individual comes under the verbal and gestural control of the hypnotist (C L Hull, 1933) The hypnotic effects of the rabble rouser are classic Then, too, some aspects of both social perception and autosuggestion are akin to hypnosis as when the individual stimulates himself in terms of conscious or unconscious wishes An example is the idealization of the person with whom one is in love.

Suggestibility may be specific to a given stimulus or it may be generalized . In fact, specificity or generality of suggestibility are doubtless closely linked to similar aspects of attitude (qv).

Both common sense and research have demonstrated a variety of factors which influence suggestibility Physiological changes induced by fatigue, certain drugs, ill health, intense emotional disturbances and prolonged undernourishment facilitate suggestibility. On the psychological side, differences in sex, age, intelligence and education are important influences. With few exceptions, experiments in modern societies show girls and women to be more suggestible than boys and men No doubt differentials in cultural training rather than innate physiological variations account for these facts Within the limits of social-cultural conditioning, children are more suggestible than older persons. Yet the very young, not being fully socialized, are less given to suggestion than those of school age However, children are not as uncritical as many believe Regarding intelligence, the feebleminded, except for the very lowest grades, are in general more open to suggestion than are normal persons. A somewhat similar contrast holds between the educated and uneducated Yet education, which prepares individuals to be highly critical in some matters, in other things merely reinforces the conformity and copying patterns first laid down in the home. In this way, the school fosters suggestibility and imitation. In truth, suggestibility is an asset in the socialization of the individual. A person's docility and deference, born of earliest parent-child relations, makes it possible to train him not only in many skills and much practical knowledge, but to indoctrinate him with the moralreligious codes of his culture and make him into a conforming, cooperating member of his society But if not balanced on the other side with critical understanding of the world and of the importance of individual independence, the exploitation of docility, deference and suggestibility by those in power may make for inflexibility. In the long run this may reduce the rate of cultural betterment and the fuller satisfactions which come to a unique and free personality.

and Iree personality.

qualification Thus, in England, the term covers an act of selfdestruction committed only while the deceased was of unsound mind otherwise, suicide, termed felo-de-se, is a cume which entails penalties against the deceased's estate. In the United States, only a few states regard suicide as a criminal act, although it may be criminal to influence or assist in a suicide In some oriental countries in the past ceremonial suicides were decreed for certain occasions, as hara-kiri, or disembowelling, by which a Japanese aristocrat defended his honour, or the suttee of the Hindu widow on the funeral pyre of her husband Ceremonial suicides declined in the 20th century, but personal suicides tended to increase

International Comparisons .- Many futile attempts have been made to explain different national rates of suicide as shown in Table I In general Catholic countries have low rates (Ireland, Italy, Spain), however, the rate for France is double that of other Catholic countries Israel (Jewish) has a low rate. Protestant countries vary from low (Norway, Scotland, the Neth-

erlands) to high (Denmark, Sweden)

In all countries, suicide rates tend to increase during economic depressions and to decrease during times of war and prosperity, as Table II shows Long-term trends vary from nation to nation In general the trend has been upward for most European countries, Norway and Denmark are exceptions with generally downward trends In the New England states, the only part of the United States for which long-term rates are known, the rates have tended to increase

Age, Sex, Marital Condition,-Studies made in Europe and the United States at widely different periods of time all show that virtually no children below the age of 15 commit suicide and that the rate for the later teens is low The rate tends to increase steadily into old age. Table III for the United States is illustrative, the rate m old age is approximately four times the rate in young adulthood

The rates for males are consistently higher than the rates for females, in different countries, at widely different periods of time

and at all ages Usually the male rate is approximately four times the temale rate. Women, however, make more unsuccessful attempts at suicide than do men

As early as the 1860s and 1870s, data from a number of European countries showed that divorced persons had the highest suicide rates and the widowed second highest Married people and those who never married had much lower rates, with sometimes one group and then the other having the lowest. The same relation of marital status to suicide rates was repeatedly found true in the United States

Urban-Rural Rates .- In both Europe and the United States cities have higher rates than adjacent rural areas. Within large cities, according to studies made in the United States, suicide rates are highest in disorganized slum areas and lowest in well-organized residential areas

Means of Suicide.-Means of suicide vary with time and place In the United States after 1901-05 firearms, hanging and gas increased in frequency while the use of poison decreased, perhaps because of greater restrictions on its sale. Table IV shows the trends in the United States

Suicide and Other Types of Violent Death.—Suicide outranks homicide as a cause of death, being anywhere from 2 to 25 times as high in different countries in Europe and North America. There seems to be no correlation, however, between high suicide and high homicide rates In the United States motor vehicle deaths are slightly more than double suicides, and other acci-dental death rates are approximately four times the suicide rates.

Interpretations.-Although suicide rates differ with various social conditions, the explanation does not lie in external forces but in the attitudes and emotions of people. Through family training, religion and education, some people acquire strong inhibitory attitudes against suicide, regardless of the stresses of life, Others, with a different philosophy, turn to suicide as a way out of difficulties Some persons, whether because of temperament or training, are able to adjust more readily than others to frustrations and hardships, it must not be overlooked also that the privations of life differ from time to time and place to place; some people are subjected to greater social pressures than others Finally, some countries provide more adequate guidance and counselling facilities than others, to which the harassed person may turn for help. (RH S C.)

SUIDAS, Greek lexicographer. Nothing is known of him, except that he must have lived before Eustathius (12th-13th century), who frequently quotes him. Under the heading "Adam" the author of the lexicon (which a prefatory note states to be "by Suidas") gives a brief chronology of the world, ending with the death of the emperor John Zimisces (975), and under "Constantinople" his successors Basil and Constantine are mentioned. It would thus appear that Suidas lived in the latter part of the 10th century The lexicon of Suidas is arranged alphabetically with some slight deviations. It partakes of the nature of a dic-

# SUI-FU-SUKHOMLINOV

d encyclopaedia. It includes numerous quotations from iters, the scholiasts on Aristophanes, Homer, Sophocles dides are also much used. CKI (stone-in-water): see Bon-seki

(Suite de pièces: Ordre, Partita), m music, a group unes in melodic forms (see SONATA FORMS) It consists of four principal movements with the insertion of one thter movements between the third and the last

it movement is the allemande, in slow common time owing rhythm, beginning with one or three short notes first full bar

ond movement is the courante, of which there are two French courante begins with one or three notes before eat, and is in a triple time (3) which, invariably at the ind sometimes elsewhere, drops into a crossing triple twice the pace (\$\frac{a}{4}\$). In homage to Couperin, Bach the French courante, but he is happier with the Italian prente, a brilliant continuously running piece in quick a (3 or 3).

abande is a slow movement in triple time beginning on ar, and with at least a tendency to the rhythm

Handel's aria Lascia ch'io pianga is a familiar example. abandes are among the most simply eloquent and charme the galanteries, from one to three in number. These

of his smaller compositions.

nly suite-movements (except some of Couperin's counich can have an alternative section and a da capo. The it galanteries are: (1) the minuet, often with a second nich is called "trio" only when it is in real three-part t is a little faster than the stately minuet in Mozart's anni, and it always begins on the full bar. (2) The lively dance in a not too rapid alla breve time; the lways begins on the half-bar. A second alternating frequently founded on a pedal or drone-bass, and is d musette. (3) The bourrée, which is not unlike the ut quicker, and beginning on the last quarter of the bar. assepied, a lively dance in quick triple time, beginning ird beat. These dances are not always cast in binary there are famous examples of gavottes and passepieds

u. Other less common galanteries are: (5) the loure, nce in 4 time and dotted rhythm; (6) the polonaise, a riple-time piece, with cadences on the second instead of er polonaises) the third beat of the bar; (7) the air, a rement, quietly flowing, in a more florid style than its

name would suggest. It sometimes precedes the sarabande.

The suite concludes with a gigue, in the finest examples of which the melodic binary form is combined with a light fugue style The gigue is generally in some triplet rhythm, eg, d, & & &. but examples in a graver style may be found in slow square time with dotted rhythms, as in Bach's first French suite and the sixth Partita of the Klavierubung In Couperin's first volume of Ordres, the gigue is followed by an enormous number of pieces which cannot have been intended to be all played on the same occasion, though they were all in the same key

Suites on a large scale begin with a prelude in some larger form Bach's French Suites have no preludes, his English Suites all have a great first movement which, except in the first suite, is in full da capo concerto form. His Partitas cover a wider range both in their preludes and their other contents. Some large suites have finales after the gigue, the great chaconne for violin solo

The later uses of the word "suite" comprise almost all sets of pieces mainly in forms smaller than those of the sonata, especially such pieces as have been selected from ballets or from incidental usic to plays. (D F T)
SUK, JOSEF (1874-1935), Czech violinist and composer,

was born at Křečovice, Bohemia, on Jan. 4, 1874. He studied at Prague conservatorium, taking composition with Dvořák, whose daughter Ottilie he afterwards married He was a member of the celebrated Bohemian Quartet. He became (1924) director of the Conservatorium at Prague. His principal works are the symphonic poems: Prague, op. 26, Asrael, op. 27, Summer Tale, op 29, and Zrani, op. 34 (1924); incidental music to the dramatized fairy-tale, Radus and Mahulena; Meditation on the choral St. Wenceslaus, Legend of Dead Victors (a war work); piano pieces, settings of Serbian folk-songs, and chamber music, including a

string quartet op. 35a. SUKHOMLINOV, VLADIMIR (1848-1926), Russian general and war minister, was born in 1848 He took part in the Russ-Turkish war as a staff officer (1877-18), and was head of the officers' cavalry school in St. Petersburg from 1886-07, being now promoted general. He was Russan war minister from 1909-16, and it was under him that the Russian orders for mobilization were given at the outbreak of World War 1. He played a diastrous role in the administration of the Russian army, but it was only in 1916, under pressure of public opinion, that the Tam Nicholas II dismissed him from office. He was finally tried and sentenced to penal servitude on the charge of treason, but was freed by an annesty granted by the Bolsheviks and went to Finland In 1921 he began the publication of his memories, which were completed in 1924.

SUKHUM-KALEH, a Russian seaport on the Black sea. It is in the Abkhazain ASSR. Pop (1933) 28,136. Sukhum bay is shellered by mountains and is never frozen, but the anchorage is poor A railway links the city with the interior. The site is marshy and malarial. It is the ancient Greek Dosskuras, and was in Turkish possession until 1829, after which it was Russian except for temorary Turkish occupation in 1824 and 1879.

SUKKUR, a town and district in Sind, Bombay, India. The town is on the right bank of the India 24 mi. SE of Shikarpur Pop (1941) 66,466 The river is now crossed by a cantilever bridge carrying the North-Western railway to Kotri

The District or Sukruw was created in joor out of pat of Shikard pur district, the remainder of which was formed into the district of Larkania Area, 5,550 s am; joo (1947) 692-56. It is chiefly alluvial crops are wheat, millets, nee, pulses and oil seeds Earthen, leathern and metal ware, cotton cloth and tussore silk are manufactured, also pupe-bowls, mill-boxes and sissons Lines of the North-Western railway serve the district, and there is a banach from Sukkur towards in 1943 and completed in 1943. The barrages, about one mide in length, crosses the Indus and feeds four main canals on the left bank and three on the right The dischage into canals is 4,5763 cusses or 45,760 gallons per second and the total length of water-course served the control of the control

15 1,300,000 ac SULA ISLANDS, a chain of islanos (Sulla, Xulla, Dutch Soela), east of Celebes, Netherlands Indies, really an extension of the eastern peninsula of that island. There are three large islands, Taliabu, Mangola and Sula Besi, and several smaller ones. Taliabu and Mangola, very long and narrow, extend west and east (with Lisamatula), 135 miles Both are mountainous, thickly forested, and thinly populated. Taliabu, the largest in area, very little known, is said to contain mountains from 3,000 to 4,000 ft. high, and hot springs. Mangola, which is much narrower than Taliabu, has Mt. Buja in its western part. Sula Besi, the smallest of the three, is well populated and cultivated Wallace considers there is an approximation between the birds of the Sula isles and those of Buru, indicating that intervening land has disappeared. The babirusa and crested baboon of Buru are found in the Sula islands. Weber's Line, suggested as an alternative division between the Oriental and Australian zoological regions, in place of the Wallace Line, passes east of the Sula Islands, but west of Burn. The islands produce good timber for shipbuilding and the natives are good navigators. Damar is collected in the foresty, ree, makes, fobucco and sugar-cane are grown on Sula and the sage palm is common, forming the staple food on Tallaband Mangola. Coal of inferior quality is found on Sula Best, where the natives weaves acrops and plair nats. The prophiction of the production of th place of the Wallace Line, passes east of the Sula Islands, but

ous and well forested, with bays affording anchorage, but also with reefs. They furnish trepang and tuttle. The people, who are mostly pagan, though Mohammedans live along the coast, are post and miserably housed Vessels call at Banggal The Sul and the sides once formed part of the territory of the property of the sides once formed part of the service of the property of the sular of the possessions. The Sula Islands were occupied by Japan m World War I. (E. E. L. X.)

SULCI, an ancient town (mod S Antioco), on an island on the south-west of Sardinia and of Carthagman origin Its walls, of sectangular blocks of stone, can be traced for more than a mile Phoenician and Roman antiquities, including statues, inscriptions, gems and a cistern of fine masonry, perhaps dating from the Punic period, have been found. The Phoenician tombs are cut in the rock, each measuring about 14 ft. square and 8 ft. high, and approached by a staircase some are converted into dwellings. Curious sculptured stelae found in these tombs are in the museum of Caghari The goddess Tanit is represented, often in a form resembling Isis The Roman tombs are simply rock trenches. There are catacombs originally Punic tombs, connected by passages in which was discovered the body of the martyr St. Antiochus, from whom the modern town takes its name. The church is cruciform, with heavy pillars and a dome it is Byzantine. A fort occupies the highest point-the acropolis of the Punic period The isthmus which, with bridges, connects the island with the mainland, is in part artificial At Tratalias, on the mainland is the fine Romanesque church of S. Maria (12th-13th cent ), formerly the cathedral. At Sulci, the Carthaginian admiral Hannibal took refuge after his defeat by C. Sulpicius, but was crucified. In 46 BC. the city was punished by Caesar for having helped Pompey's admiral Nasidius. (T. A.)

SULEIMAN: SEE SOLIMAN.

SULEIMANIYE, an Iraqi town on the Iranian frontier, on the caravan route from Baghdad to Tabriz. Pop (mostly Kurds) probably over 30,000. There was formerly a large trade with Iran. The town gives its name to the administrative division

SULFONAL GROUP, THE. The group of compounds known as study sulfuens were first prepared in 1885 and introduced into therapeutic sthree years later by Eugen Baumann and Alfred Kast. Formerly very popular as hypnotics, these agents are now seldom used. Sulfonmethane (sulfonal) is slowly absorbed from the intestinal tract and its effects are also in appearing. Depression after awakening is common and may be severe Because the drug is slowly excreted, cumulation may occur during continuous administration producing toxic effects and poisoning. Death from overdosage is due to failure of respiration and circulation. Chronic poisoning causes mental and gastro-intestinal symptoms and urinary changes. Other manifestations may make their appearance in the skin, liver and kidneys. The average dose is 0.75 to 1.0 gram in capaules or hot drinks.

Suifamethylmethane (Trional) and Sulfondiethylmethane (Tetronal) are other representatives of the sulfonal group. Trional is absorbed more rapidly than sulfonal, Tetronal more slowly.

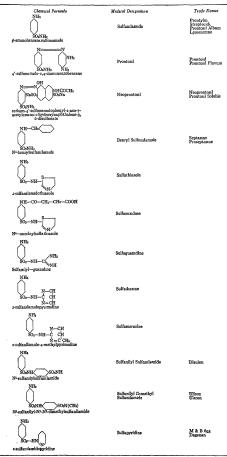

(A. E. Sr.)

SULFONAMIDES, THE. The sulfonamides consist of a group of chemicals which have as their basic structure p-numbenzenesulfonamide. From the parent substance, designated sulfanilamide, varous related compounds were made, usually by substituting or adding various groups to the sulfon radical. (See accompanying formulae)

No group of drugs had ever attracted wider attention in medical therapeutics, since they became responsible for the saving of many lives, for decreasing the total number of days of illness in many thousands of cases and for the prevention of some infections.

The historical development of these chemicals as drugs is of great interest, since p-aminobenzenesulfonamide was not developed as a drug but rather as a chemical for the dye industry. In 1908, the synthesis of p-aminobenzenesulfonamide was announced by P. Gelmo. and a vear later three investigators of the

'This spelling has been adopted by the editors of Emyslopadia Britannica in preference to "Sulphonamide" because of its general acceptance not only in the United States but in other English-speciang parts of the world, especially after the drugs' widespread see an all battlerous in World War II.

FORMULAE, MEDICAL DESIGNATIONS AND U.S. TRADE NAMES OF THE SULFONAMIDES

IG Farbenindustrue of Germany (Heinrich Horlein, Oscar Dressel and Richard Kothe) described the preparation of a group of dyes (azo dyes) in which a double atom of hydrogen is replaced by a double atom of nitrogen and combined with sulfonamides They were searching for a mordant for their dyes and found that p-aminobenzenesulfonamide fuffilled that requirement It was their opinion that the sulfonamide was responsible for the close union of the dye with the protein of the wool

At this time, no one expressed any interest in sulfanilamide or any of the azo dyes as antibacterial agents for the treatment of disease. During the next decade, several new azo dyes were developed which were known to possess antibacterial properties outside of the body, but so far as can be ascertained they were not tested in human infections. Philipp Eisenberg knew that the dye chrysoidine was bactericidal, and Michael Heidelberger and W. A. Jacobs. working at the Rockefeller Insti-tute for Medical Research in New York, published expenments demonstrating that pamınobenzenesulfonamide hydrocupreine was a potent antibac-terial agent, but here again there is no evidence that it was tried in the treatment of infections in man.

man.
Another ten years passed, and very little information about these azo dyes as antibacterial agents developed However, on Christmas day in 1932, the German patent office issued a patent for "Prontosil" and other sulfonamide-containing azo dyes to Fitz Metexah and Josef Klarer of the I.G. Farbenmotustrie. It was not until Dec. 1934 that this patent was disclosed, and it was not published until Jan. 1935. As the story unfolds, however, it seems clear that experimental work had been going on in the study of infections in man and animals for at least two or more years before the patents on

Prontosil were announced.

On Feb 15, 1935, there appeared in the Deutsche Medistrikehe Wochenschrift an article by Gerhard Domagk on "Ein Bettrag zur Chemotherape der Bakteriellen Infektionen." He stated that during Christmas week of 1932, the same time that the patents were issued to Mietzsch and Klarer, he carried out some experiments in mice,

using Prontosil to treat streptococcic infections. He pointed out clearly that Prontosil was a red dye of low toxicity and when it was exhibited to mice infected with streptococci it prevented death. This red dye was also effective in controlling the course of staphylococcic infections in rabbits, but it was infefective in pneumococcic and other experimental infections.

Scaphylococcu mfectons in man are responsible for boals carbundes and mfectons of bone, and if the organisms invade the blood stream, septicaemus occurs and the fatality rate is high Pneumococcu infections are responsible for most case of typical lobar pneumonas. Domagk called attention to the fact that Prontoils is a true chemotherapettic agent only in the living animal. That is to say, it had very little demonstrable bacterical (falling) effect on bacteria as studied in the test tube.

In spite of the fact that the results of these important experiments were not published until several years after they were made, there is evidence that Prontosil had been distributed to certain physicians for climical investigation as early as 1933. In May 1933 a report of using Prontosil in the treatment of staphy-lococcic miection was made in Germany, and within the next two years a number of favourable reports appeared in the German literature concerning its effect in streptococcic infections such as ervision such as ervisional such as expended.

The next chapter in the story turns to France. It is recorded that after several unsuccessful attempts to obtain Prontosal from Germany, it was finally synthesized by A. Girard and called "Rubasol." If was tested in animals and the earlier observations of Domage were in large part confirmed Then J. Teffond, F. Nittl and D. Bovet made the suggestion that azo dyes were changed in the issues and broken at the azo linkage to paramice benzelesulfonamide They went further and suggested that the active principle in Prontosal's its laster compound This view was soon confirmed in experimental animals, but sulfanilamide was not used therapeutically in man until sometime later.

The attention of British physicians was attracted by the reports about these antibacterial agents which were coming from the continent of Europe, and Leonard Colebrook, who had had a wide experience in the treatment of infections following childbirth in the Queen Charlotte hospital in London, began his important studies In 1936 he and Meave Kenny reported their results, which were eminently satisfactory, and indeed most impressive. Other important contributions to the subject were soon made by G A. H Buttle, W H Gray and Dora Stephenson, who confirmed the value of p-aminobenzenesulfonamide as well as Prontosil in experimental infections in animals.

These observations of the British physicians aroused great interest in the subject of chemotherapy in both England and the United States, and within a short time several groups of investigators in the United States became actively engaged in the study of these compounds in experimental infections in animals and in infections in man. P. H. Long and E A. Bliss in Balti-more, R R Mellon, Paul Gross and F. B. Cooper in Pittsburgh and S. M. Rosenthal and Hugo Bauer in Washington began their studies, which aroused a tremendous amount of interest. The clinical observations on patients were soon placed on a sound basis by E. K. Marshall and his associates through the development of chemical methods for determining the amount and distribution of these drugs in the body after they were given by mouth, or injected into the blood stream. To Marshall and his colleagues belongs the credit for placing bacterial chemotherapy on a sound and rational basis, since by using their methods of chemical analysis and knowing the pharmacology of these substances, patients could be followed with objective methods in the treatment of disease.

The first paper on this subject to arouse widespread interest and excitement in the American medical profession was that of Long and Bluss. They described their experimental work in summars and their results in the treatment of patients with various infections, and these results were just as remarkable as those reported in England and disewhere. All these observations were soon confirmed and later extended by Long and Bluss and others.

The original experiments in animals of all investigators sug-

gested that the sulfonamides would have their greatest field of application in the treatment of streptococcic and perhaps staphylococcic mfections It soon became apparent, however, that streptococci were much more susceptible to these drugs than staphylococci, and that sulfanilamide was of little or no value in the treatment of pneumonia due to the pneumococcus. Thus it was found that erysipelas, streptococcus meningitis and infections following childbirth were influenced in the most favourable way. It was not long, however, before it was discovered that sulfanilamide had a profound effect on meningococcic and gonococcic infections-that is, the organisms causing cerebrospinal meningitis and gonorrhoea-and the results of treatment in these infections were most favourable. In meningococcic meningitis, the fatality rate was greatly reduced and the course of the disease shortened In gonococcic infections, the course of the disease was greatly shortened in more than half the cases

Af first it was a great disappointment that sulfanilamide had no favourable effect on the commonest form of pneumona—pneumococic, pneumona—since here was a common acute inction of the lungs with a high fatality rate which frequently attacked people in the prime of life and for which some simple ofform of treatment was needed it was not long, however, before A. J. Ewiss and M. A. Phillips synthesized sulfapyridine in England and showed that this was an effective agent in pneumococic pneumona. The fatality rate in this disease fell promptly from an average of 35% to 20% to between 3% and 10%. Here, then, was another important disease that was influenced favourably by these drugs

After 1936, the subject of chemotherapy advanced at a rapidpace, and scarcely a year went by that one or more new devatures were not discovered and tested. There were available by 1943 a large number of drugs which had been tested and found to be effective, including sulfapyridne, sulfathuszole, sulfadiszne, sulfapyrapiae, sulfamerazine, sulfatundine and sulfassusdine

It is a striking fact that the sulfonamides have such a wide field of application in the treatment of infections. The outstanding results achieved in the treatment of streptococcic, pneumococce, meningococcic and genoecocci infections were no less than phenomenal when compared with those gained from previous forms of treatment. Aside from the results obtained in the above infections, striking advances were made in the treatment of infections of the kindey and bladder, and dyentery (epidemic diarrhoes), and in wound milections and burns. Many lives were saved in World War II from there use in all sorts of infections saved in World War II from there use in all sorts of infections tables when they entered any theatre of military operation, and they were instructed how to use them if they became wounded. Many infections which were prevalent in other wars were reduced, and the duration of many illnesses was shortened.

Mode of Action.—The precise mode of action of the sulfonamides remains obscure. It is plain that the sulfonamides inhibit the growth of the organisms, but they do not kill them by any direct action. That is to say, they are agents which retard the growth and reproduction of the organisms which, however, are still able to survive. This is in stiking contrast to the bectricadal (killing) agents, of which the various antiseptics such as phenol and cresol are examples. The body defense mechanism is extremely important in the recovery process of all infections, so that this mechanism must be taken into account in assessing the outcome of the illness as well as the mode of action of the sulfonamides. This deceases mechanism consists of active and viable white blood corpusacies tense mechanism consists of active and viable white blood corpusacies tense mechanism consists of active and viable white blood corpusacies stances which develop in the body and antagoainze the growth of bacteria. The sulfonamides do not interfere with the development of antibodies nor with the activity of the ceils which destroy baccinessing its efficiency and infections are overcomed to a better chance of increasing its efficiency and infections are overcomed.

Toxic Effects.—All the sulfonamides are capable of producing signs of drug intoxication, and many patients become hypersensitive to them, so that serious reactions may follow their use a second time. It is advisable, therefore, that these drugs be taken only under the supervision of a physician, and for an short a period of time as is necessary. The commonest signs of drug intoxication are nauses and vonuting and mental confusion. In the case of sulfamhamde the skin and the mucous membranes often become blue due to the presence of a blee pigment in the haemoglobin of the blood. This is a harriless type of the sign of introviction are assemined due to the description of the sign of the sign of introviction are described by the struction of the white blood corpusels. SULGRAVE MANOR, the early English home of the ancestors of George Washington Stutated 2½ ml. N.W. of Helm-don in Northamptonshire, England, it is a notable shrine Laurence Washington, twice mayor of Northampton, bought the property from King Henry VIII in 1530, on the dissolution of

SULGRAVE MANOR, NORTHAMPTONSHIRE, THE ANCESTRAL HOME OF

the smaller religious houses. It had previously belonged to the priory of St. Andrew, Northampton. Laurence Washington, from whom George Washington was seventh in direct descent, and his children and grandchildren lived in the manor house until 1610

Sugrave Manor was purchased, in Jan. 1914, for £3,00, by the British committee for the celebration of 100 years of peace between Great Britain and the United States (£84,4-914,) and is vested in three ar-officio trustees: the American ambassator in London, the British ambassator in Washington and the regent of the Mount Vernon Ladies' Association of the Union. It is partly restored to its original condition, and furnished with choice furniture of the period. A formal reopening took place, on June 21, 1921. In 1927 the restoration was completed by the ribuilding of the western wing, which had been demolished in the 18th century. The funds were collected by the American Society of Colonial Dames, which body had, two years previously, raised at permanent endowment of over £30,000.

On the gable of the central porch are the royal arms of the Tudors; and in the right spandrel of the arch of the main doorway, the Washington arms, three mullets and two bars, which

were reputedly the origin of the Stars and Stripes, the American national flag. The furnishings are gifts from British and American donors, and include an original Gilbert Stuart pointrait of George Washington and many other treasures. (L of F.)

SULIDAE: see GANNET

SULIMAN HILLS, a mountain system on the northwest frontier of India The chief mass of the range is known as Takhl-1-Suliman or Solomon's thorne. The legend of the mountain is that Solomon visited Hindostan to marry Balkis, and that as they were returning through the air, on a throne supported by genin, the bride implored the bridegroom to let her look back for a few moments on her beloved land Solomon directed the genif to scoop out a hollow for the throne on the summit of the mountain. The hollow is a cavity some 30 ft square cut out of the solid rock, at the southern extremity of the mountain and is a place of plagrimage for both Hindus and Mohammedans as The shrine is about 2 mi. S. of the highest peak. The whole mountain culminates in two points, incop ft and it, also of the understanding the solution of the solid with the solution of the solid rock, at the southern extremity of the mountain and is a should be solved the solution of the sol

SULINA, the second Black sea port of Rumana, and the only free port for imports Pop (1930) 5,924. The mouth is gen-

erally blocked with ice in the winter

SULTIELMA, a mountain (6,558 ft.) on the fronter between Norway and Swoden. It is covered with a snowfield from which many glaciers descend. The mountain is famous as a source of pyrites, the nopper, which occurs as lodes in schists. From Sjonstan steamers on the Langvand and a light railway give communication between the sea and Furulund. the mining centre.

SULLA, LUCIUS CORNELIUS (138-78 BC.), surnamed Felix, Roman general, politician and dictator, belonged to a minor and impoverished branch of the famous patrician Cornelian gens. He was quaestor in 107 under Marius, for whom he commanded the cavalry in the Jugurthian war. The surrender of Jugurtha was made to Sulla, and was the beginning of the rivalry with Marius Sulla won the enthusiastic devotion of his troops. From 104 to 101 he served again under Marius in the war with the Cimbri and Teutons and fought in the last great battle in the Raudian plams near Verona In 93 he was elected practor after a lavish squandering of money and he delighted the populace with an exhibition of a hundred lions from Africa. Next year (92) he went as propraeto, of Cilicia with special authority from the senate to make Mithradates VI of Pontus restore Cappadocia to Ariobarzanes, one of Rome's dependants in Asia. This he did. subsequently receiving an embassy from the Parthians asking alliance with Rome In or he returned to Rome, now one of the leading men on the senatorial side. He outshone Marius in the Social War by defeating the Samnites and taking Bovianum.

Consul.-Sulla was consul in 88, and finished the revolt by the capture of Nola. Meanwhile he had obtained by lot the command against Mithradates; Marius wanted that, and in order to get it entered into a coalition with Sulpicius Rufus, who had a plan of revolutionary legislation to carry out. Sulpicius, quite unconstitutionally, transferred the command to Marius by vote of the assembly. Rioting took place at Rome at the prompting of the popular leaders. Sulla narrowly escaping to his legions in Campania, whence he marched on Rome, being the first Roman who entered the city at the head of a Roman army. Sulpicius was put to death, and Marius fled Sulla, leaving things quiet at Rome, quitted Italy in 87, and for the next four years he was winning victory after victory against the armies of Mithradates and accumulating boundless plunder. Athens, the headquarters of the Mithradatic cause, was taken and sacked in 86, and in the same year, at Chaeroneia, the scene of Philip II of Macedon's victory more than two and a half centuries before, and in the year following, at the neighbouring Orchomenus, he scattered immense hosts of the enemy with trifling loss to himself Crossing the Hellespont in 84 into Asia, he was joined by the troops of C. Flavius Fimbria, who soon deserted their general, a man sent out by the Marian, party, now again in the ascendant at Rome. The same year peace was concluded with Mithradates.

Sulla returned to Italy in 83, landing at Brundisium. Marius had died in 86, and the revolutionary party, specially represende by L. Cornelius Cinna, Cn. Papirus Carbo and the younger Marius, had massacred Sulfa's supporters wholesale, confiscated his property, and declared him a public enemy. They had large forces ready to meet him, but Sulfa's declaration that he did not intend to deprive the Italians of the franchise cut the ground from under their feet, and only the Samultes remained in arms

In the following year (32) he won a decisive victory over the younger Marius near Praeselse (mod. Palestrian) and then marched upon Rome, where again, just before his defeat of Marus, there had been a great massacre of his adherents, in which the learned jurist Q Mucius Scaevola persibed. Rome was at the same time in externe peril from the advance of a Samutic atmy, and was barely saved by Sulla, who, after a hardfough tattle, routed the enemy under Pontius Telesinus at the Colline gate of Rome. With the death of the younger Marius, who killed himself after the surrender of Praenest, the civil war was at an end, and Sulla was master of Rome. Then came the memorable "proscription," when for the first time in Roman was ready to the proscription of the control of the proscription was ready to the proscription of the p

and the control of the control was revived and some was not maked experience of Rome. After celebrating a splended trummpl for the Mithraduct with a great pumple as armane of "Fells" he control that the control of th

In 79 Sulla resigned his dictatorship and retired to Puteoli (mod. Pozucoli), where he dred in the following year, probably, from the bursting of a blood-vessel in a fit of passion. The "halflion, half fox," as his enemies called him, the "Don Junn of politics" (Mommsen), the man who carried out a policy of "blood and iron" with a grim humour, ansued himself in his last days with actors and actresses, with dabbling in poetry and completing his Memoirs; Gest H. Peter. Historicoum remonsorum reliculos.)

He was accorded a magnificent public funeral, his body being removed to Rome and burred in the Campus Martius. His monment bore an inscription written by himself, to the effect that he had always fully repard the kindnesses of his friends and the wrongs done him by his enemies. His reforms, mechanically excellent, were all failing to pieces before his death, except the quaestiones perpetuae, which became the basis of Roman criminal justice. He tried in van to put the clock back.

SULLIVAN, SIR ARTHUR SEYMOUR (128,2-79co), English composer, was born in Lambeth on May 13, 1343, being the son of a cultivated Lish musician who was bandmaster at the Royal Military college, Sandhurst, from 1343 to 1356, and taught at the Military School of Music at Kneller Hall from 1857 till his death in 1866. His mother, née Mary Coghlan (1321-1383), had Italian blood in her vens. Arthur Sullivan was brought up to music from boyhood, and he had learned to play every wind instrument in his father's band by the age of eight. He also had a fine treble voice, and became a chorister of the Chapel Royal, In 1856 he wan the Madelssonis scholarship at the Royal caded.

emy, where he studied under Sterndale Bennett, Arthur O'Leary and John Goss. In 1858 he was sent to study at Leipzig, where he had for teachers Moscheles and Plady for panoforte, Hauptmann for counterpoint, Rietz and Reinecke for composition, and F, David for orchestral playing and conducting

After two years' hard study he returned to London in April 1861 and at his instigation Schumann's first symphony was fin-troduced at one of the Crystal Palace winter concerts. The followen year his own Tempets muse was performed at the same concerts. Then followed his Kembsorh's canata (remembered chiefly for the charming duet, "How Sweet the Moonlight"), the Sapphire Neckleze overture, and the five beautiful songs from Shakespeare, which include "Orpheus with his Lute," "Oh Mises Mine" and "The Willow Song." His attractive personality, combined with his undoubted genus and brillnant promise, brought hum many friends. Costa, who was conductor at Covent Garden, gave him the post of organist, and in 1854 he produced there his showed his genius for light operatic music in his collaboration with F. C. Burnand in Cost and Box and in 1857 he first showed his genius for light operatic music in his collaboration with F. C. Burnand in Cost and Box and in 1850 rebondusts.

In 1821 Sullivan became acquainted with W. S. Gilbert (a.v.). and in that year they collaborated in a piece for the Gaiety theatre, called Thespis; or, The Gods Grown Old, which was a great success in spite of the limited vocal resources of the performers. In 1875 R D'Ovly Carte, then acting as manager for Selina Dolaro at the Royalty, suggested to Gilbert collaboration with Sullivan in a piece for that theatre. Gilbert had already suggested to Sullivan an operetta with its scene in a law court, and within three weeks of his completing the libretto of Trial by Jury the music was written. The piece succeeded beyond all expectation; and on the strength of its promise of further successes D'Oyly Carte formed his Comedy Opera company and took the Opera Comique theatre. There in 1877 The Sorgerer was produced. George Grossmith and Rutland Barrington being in the cast In 1878 H.M.S. Pinafore was brought out at the Opéra Comique. and ran for 700 nights. In America it was enthusiastically received and pirated right and left and the two authors, with D'Ovly Carte, went over to the U.S. in 1870, with a company of their own, in order to produce it in New York. To secure the American rights for their next opera, they brought out The Pirates of Penzance first at New York in 1879. In 1880, in London, it ran for nearly 400 nights. In 1881 Patience was produced at the Opéra Comique, and was transferred later in the year to the Savoy theatre. There all the following operas came out. Iolanthe (1882), Princess Ida (1884), The Mikado (1885), Ruddigore (1887). The Yeomen of the Guard (1888), The Gondoliers (1889). The vogue of the new type of light opera owed something to such admirable performers as George Grossmith, Rutland Barrington, Miss Jessie Bond, Miss Brandram, and later W. H. Denny and Walter Passmore; but these artistes only took advantage of the opportunities provided by the two authors. In place of the old adaptations of French opera bouffe they had substituted a genuinely English product, humorous and delightful, without a tinge of vulgarity or the commonplace. But disagreements arose between them which caused a dissolution of partnerments arose between them which caused a dissolution of partner-ship. Sullivan's next Savoy opera, *Haddon Hall* (1892), had a libretto by Sydney Grundy; and the resumption of Gilbert's collaboration in 1893 in *Utopia*, *Limited*, and again in 1896 in The Grand Duke, was not as successful as before. Sullivan's music, however, still showed its characteristic qualities in The Chieftain (1894)—largely an adaptation of Contrabandista; The Beauty Stone (1898), with a libretto by A. W. Pinero and J. Comyns Carr; and particularly in The Rose of Persia (1900), with Basil Hood.

In 1872 Sullivan's Te Deum for the recovery of the prince of Wales was performed at the Crystal Palace. In 1873 he produced at the Birmingham Musical festival his oratorio The Light of the World, in 1877 he wrote his incidental music to Henry VIII, in 1880 his sacred cantata The Marryr of Antioch, and in 1886 The Golden Legend was brought out at the Leeds festival. In 1891, for the opening of D'Oyly Carte's new English opera-house in Shaftesbury avenue, later the Palace theatre, he wrote his "grand opera" Ivankoe to a libretto by Juhan Sturgis. The attempt to put an English opera on the stage for a long run was doomed to failure, but Ivanhoe contains many admirable pages. In 1802 he composed incidental music to Tennyson's Foresters. In 1897 he wrote a ballet for the Alhambra, called Victoria and Merrie England Among his numerous songs, the best known are "Orpheus With His Lute." "Thou'it Passing Hence" and, most famous of all, "The Lost Chord" This last, hackneyed as it became, was probably the most successful English song of the 19th cen-The hymn tune "Onward, Christian Soldiers!" (1872) shows Sullivan in another light. In 1876 he accepted the puncipalship of the National Training School of Music, which he held for six years; this was the germ of the subsequent Royal college. He was conductor of the Leeds festivals from 1879 to 1808, besides being conductor of the Philharmonic society in 1885. He died on Nov. 22, 1900, and was buried in St Paul's cathedral Among works which he left unpublished may be mentioned a Te Deum, written for performance at the end of the South African War, and an unfinished Savoy opera to a libretto by Basil Hood, which, completed by Edward German, was produced in 1001 as The Emerald Isle Sullivan was the one really popular English composer of any artistic standing in his time One of the most agreeable companions, broad-minded and free from all affectation, he was intensely admired and loved in all circles of society; and though he suffered during many years from a painful ailment, he enjoyed life without being spoiled by success.

Bullonafier — A Lawrence, Sir Arthur Sullivan: Life Story, Letters and Remniscences (1899), H. Saxo-Wyndham, Arthur Seymour Sullivan (1926); Herbert Sullivan and Newman Flower, Sir Arthur Sullivan, Hit Life, Letters and Duries (1928).

SULLIVAN, JOHN (1740-1795), American soldier, was born in Somersworth (now Rollinsford), NH, on Feb. 17, 1740. He practised law at Berwick, Me., and at Durham, N H., was a member of the New Hampshire provisional assembly (1774), and also a member of the first continental congress In June 1775 he was appointed brigadier general in the continental army and aided in the siege of Boston. In the same year he took command of the American army in Canada and exhibited great skill in effecting a retreat from that province. Soon afterward, having been superseded in command by General Gates, he rejoined Washington's army and took part in the battle of Long Island, where he was taken prisoner In December he was exchanged, and succeeded Gen. Charles Lee in command as major general of the right wing of Washington's army. In the battle of Tienton he led an attack on the Hessians, and on Aug. 22, 1777, he led a night attack against the British and Lovalists on Staten Island. He commanded the American right in the battle of Brandywine and took part in the battle of Germantown. In March 1778 he was placed in command in Rhode Island, and in the following summer plans were made for his co-operation with the French fleet under Count d'Estaing in an attack on Newport.

The Indian raids in western New York, especially the atrocities in the Wyoming and Cherry valleys, caused a retaliatory expedition to be sent to "chastise and humble the Six Nations," and Sullivan was chosen to lead the expedition With about 4,000 men, he defented the Iroquois and their Loyaltst allies at Newtown (now Elman, N.Y.), humoul their Villaga and destroyed their orchards and cops. Although severity criticized for his conduct of the expedition, stigned from the army. Sulfivan was again a defeated to the confirmation of the control of the control of the confirmation of the control of the control of the confirmation of the control of the defeated the Iroquois and their Loyalist allies at Newtown (now

SULLIVAN, JOHN LAWRENCE (1858-1918), U.S. professional boxer, known as the "Great John L." and the "Boston Strong Boy." Born on Oct. 15, 1858, at Boston, Mass., Sullivan attended school there and for a time studied at Boston college. At the age of 19 he launched his professional boxing career. Sullivan was supreme at the rough-and-ready style, and in 1882 knocked out Paddy Ryan in nine rounds to win the championship.

He held the title until Sept 7, 1892, when James J Corbett knocked him out in 21 tounds at New Orleans, La In the last bare-knuckle fight of professional boxing, Sullivan knocked out Take Kiliain in 1880 in a 75-round battle that lasted 2 hr 15 min 25 sec Sullivan, who had earned more than \$1,000,000 as champion but dissipated it all, later became an advocate of prohibition and gave many lectures on the subject before his death in modest circum-(J.P.D.X.) stances on Feb 2, 1918

SULLIVAN, a city of southwestern Indiana, U.S., on federal highways 41 and 150, 26 ml. S of Terre Haute; the county seat of Sullivan county. It is served by the Chicago and Eastern Illinois and the Illinois Central railways. The population was 5,423 in 1950, 5,077 in 1940 and 5,306 in 1930 by federal census. It is in one of the principal coal fields of the state, and there are oil and gas wells in the county. The city was founded in 1842 and in-

corporated in 190

SULLY, JAMES (1842-1923), English psychologist, was born on March 3, 1842, at Bridgwater, and was educated at the Independent college, Taunton, the Regent's Park college, Gottingen and Berlin. He was Grote professor of the philosophy of mind logic at University college, London, from 1892 to 1903 An adherent of the associationist school, Sully wrote Sensation and Intuition (1874), Outlines of Psychology (1884); The Human Mind (1892); and An Essay on Laughter (1902). He died at Richmond, Sur, on Oct. 31, 1023

SULLY, MAXIMILIEN DE BÉTHUNE, DUC DE (1560-1641), French statesman, was born at the château of Rosny near Mantes on Dec. 13, 1560, son of François de Béthune, baron de Rosny (1532-75). Blought up in the Reformed faith, Maximilien joined the court of Henry of Navarre in 1571. He was taken to Paris by his patron and was studying at the college of Bourgogne at the time of the St Bartholomew massacre, from which he escaped by discreetly carrying a book of hours under his arm On the outbreak of civil war in 1575 he enlisted in the Huguenot army In 1576 he accompained the duke of Anjou on an expedition into the Netherlands in order to regain the former Rosny estates, but being unsuccessful he attached himself for a time to the prince of Orange Later rejoining Henry of Navarre in Guienne, he displayed particular ability as an engineer. In 1583 he was Henry's special agent in Paris In 1584 he marned Anne de Courtenay, a wealthy heiress, who died, however, in 1580 On the renewal of civil war Rosny again joined Henry of Navarre, and at the battle of Ivry (1500) was seriously wounded He counselled Henry IV's conversion to Roman Catholicism. but steadfastly refused himself to become a Roman Catholic.

Rosny became a member of the king's council of finance in 1506 and appears to have been sole superintendent as early as 1508. He authorized the free exportation of grain and wine, reduced legal interest from 83% to 64%, established a special court for trial of cases of peculation, forbade provincial governors to raise money on their own authority, and otherwise removed many abuses of tax collecting, abolished several offices and by his honest, rigorous conduct of the country's finances was able to save between 1600 and 1610 an average of 1,000,000 livres a year. His achievements were by no means solely financial. In 1599 he was appointed grand commissioner of highways and public works, superintendent of fortifications and grand master of artillery; in 1602 governor of Mantes and of Jargeau, captain-general of the queen's gens d'armes and governor of the Bastille; in 1604 governor of Poitou; and in 1606 duke and peer of Sully, ranking next to princes of the blood. He declined the office of constable because he would not become a Roman Catholic. Sully encouraged agriculture, urged the free circulation of produce, promoted stock raising, forbade the destruction of the forests, drained swamps, built roads and bridges, planned a vast system of canals and actually began the canal of Briare He strengthened the French military establishment: under his direction Évrard began the construction of a great line of defenses on the frontiers. Sully opposed the king's colonial policy as inconsistent with the French genius, and likewise showed little favour to industrial pursuits. although on the urgent solicitation of the king he established a few silk factories. He fought in company with Henry IV in Savoy (1600-1601) and negotiated the treaty of peace in 1602: in 1603 he represented Henry at the court of James I of England; and throughout the reign he helped the king to put down insurrections of the nobles, whether Roman Catholic or Protestant. It was Sully, too, who arranged the marriage between Henry IV and Marie de Médicis

The political rôle of Sully practically ended with the assassination of Henry IV on May 14, 1610 Although a member of the council of regency, his colleagues were not disposed to brook his domineering leadership, and after a stormy debate he resigned as superintendent of finances on Jan 26, 1611, and retired to private life The baton of marshal of France was conferred on him on Sept 18, 1634 He died at Villebon, on Dec 22, 1641

Sully was hated by Catholics because he was a Protestant, by Protestants because he was faithful to the king. He was an excellent man of business, mexorable in punishing malversation and opposed to the rumous expenditure which was the bane of European monarchies. He was implicitly trusted by Henry IV, and contributed greatly to the recovery of France.

Solly left a curous collection of memors bearing the title, Mémoire day singe et rysile occinomies l'étaid, demestiques, patiques, et des singes et rysiles occinomies l'étaid, demestiques, patiques, et de for the bistory of the time, though they contain fictious matter such as a misson by Sully to England in 160;, and the "grand deagn" for a Christian republic. The best efficient of the original is that in JF Michard and J J F Poujoulat, Noveelle collection des mémoires relatifs à l'hator et Proujoulat, Noveelle collection des mémoires relatifs à l'hator et Proujoulat, Noveelle collection des mémoires relatifs à l'hator et Proujoulat, Noveelle collection des mémoires relatifs à l'hator et Proujoulat, Noveelle collection des mémoires relatifs à l'hator et Proujoulat, Noveelle collection des mémoires et des l'économies de l'action de l' translation by Charlotte Lennox appeared in 1756 and was later revised and republished (4 vols, London, 1856).

SULLY, THOMAS (1783-1872), US artist, was born at Horncastle, England, on June 8, 1783. His parents, who were actors, took him to the United States, when he was nine years old. settling at Charleston, S C. He was first instructed in art by a French miniature painter Afterward he was a pupil of Gilbert Stuart in Boston, and in 1809 he entered the studio of Benjamin West in London. He returned in 1810, and made Philadelphia his home, but in 1837 again visited London, where he painted a fulllength portrait of Queen Victoria for the St George's Society of Philadelphia. Sully was one of the best of the early American painters. He died in Philadelphia on Nov 5, 1872. Among his portraits are those of Comm. Decatur (city hall, New York), the actor, George Frederick Cooke, as Richard III (Pennsylvania Academy of the Fine Arts, Philadelphia); Lafayette (Independence hall); Thomas Jefferson (U.S. military academy, West Point, N.Y.); Charles and Frances Anne Kemble and Reverdy Johnson

SULLY-PRUDHOMME, RENÉ-FRANCOIS-AR-MAND PRUDHOMME (1839-1907), French poet, born in Paris, March 16, 1839, was educated at the Lycée Bonaparte, where he took his degree as Bachelier ès Sciences An attack of ophthalmia interrupted his studies and necessitated an entire change in the course of his career. He found employment for a time in the Schneider factory at Creuzot, but he soon abandoned an occupation to which he was eminently unsuited. He subsequently entered a notary's office in Paris. It was during this period that he composed those early poems which were not long in acquiring celebrity among an ever-widening circle of friends. In 1865 he published his first volume of poems, which was favourably reviewed by Sainte-Beuve, to whose notice it had been brought by Gaston Paris. It was at this moment that the small circle of which Leconte de Lisle was the centre were preparing the Parnasse, to which Sully-Prudhomme contributed several pieces. In 1866 Lemerre published a new edition of the Stances et poèmes and a collection of sonnets entitled Les Epreuves (1866). From this time forward Sully-Prudhomme devoted his life entirely to poetry. It was in the volume of Les Epreuves that the note of melancholy which was to dominate through the whole work of his life was first clearly discernible. In 1869 he published a translation of the first book of Lucretius with a preface and Les Solitudes. In 1870 a series of domestic bereavements and a serious paralytic illness resulting from the strain and fatigue of the winter of 1870, during which he served in the Garde Mobile, shattered his health. In 1872 he published Les Écuries d'Augias. Croquis italiens, Impressions de la guerre (1866-72) and Les sufficient for the wholesale production of the explosive, picric

Destms, La Révolte des heurs in 1874, in 1875 Les vaines Tendresses, in 1878 La Justice, in 1886 Le Prisme and in 1888 Le Bonheur All these poems were collected and republished under the title of Poésies, occupying four volumes of his Oeuvres (6 vols , 1883-1904) After the publication of Le Bonheur he practically ceased to produce verse and devoted himself almost entirely to philosophy He published two volumes of prose criticism L'ex-pression dans les beaux arts (1884) and Réflexions sur l'art des vers (1802) Various monographs by him appeared from time to time in the philosophical reviews, and among them a series of essays (Revue des deux mondes, Oct 15th, Nov 15th, 1890) on Pascal, and a valuable study on the "Psychologie du libre arbitre" in the Revue de métaphysique et de morale (1906) He was elected to the academy on Dec 8, 1881. On Dec. 10, 1901, he was awarded the Nobel prize for literature, and devoted most of the money to the foundation of a prize for poetry to be awarded by the Société des gens de lettres. He was one of the earliest champions of Captain Dreyfus In 1902 he wrote, in collaboration with Charles Richet. Le Problème des causes finales. During his later years he lived at Châtenay in isolation, a victim of perpetual illhealth, and mainly occupied with his Vraie religion selon Pascal (1905). He had been partially paralyzed for some time when he died suddenly on Sept. 7, 1907 He left a volume of unpublished verse and a prose work. Le Lien social, which was a revision of an introduction which he had contributed to Michelet's La Bible de Phymanté

See C. Hémon, La Philosophie de Sully-Prudhomme (1907), Sully-Prudhomme by E. Zyromski (Paris, 1907).

SULMONA (anc Sulmo), a city of the Abruzzi, Italy. Pop (1936) 16,854 (town), 21,289 (commune). Sulmona is situated at a height of 1,322 ft above the sea on the Gizio, a tributary of the Pescara, which supplies water-power to its paper mills, fulling mills and copperworks. Its cathedral of San Panfilo has a 14th century portal, and an 11th century crypt. S. Maria della Tomba is a good Gothic church S. Francesco della Scarpa occupies the site of an older and larger church, the Romanesque portal of which still stands at the end of the Corso Ovidio, and forms the entrance to the market. Opposite is a picturesque aqueduct of 1256 with pointed arches, which supplies the Renaissance Fontana del Vecchio (1474) S. Agostino has a good Gothic portal. The Palazzo dell' Annunziata, begun in 1320, shows an interesting and successful mixture of Gothic and Renaissance styles In the court of the grammar school is a fine 15th century statue of Ovid, the most celebrated native of the town, whose memory is preserved among the peasants in songs and folk-lore, and outside is a good monument to him by Ettore Ferrari (1925) The Porta Napoli is a gate of the 14th century Innocent VII was a native of the town. In the vicinity of the town is Monte Morrone where Pietro da Morrone lived as a hermit and founded a monastery for his hermits, who after his elevation to the papacy as Celestine V (1204) took the name of Celestines; the monastery (S. Spirito) is a prison.

Sulmo was devastated by Hannibal (211 BC) It was famous for its ironsmiths. Charles V bestowed it on the vicerov of Naples, Charles de Lannoy, who had captured Francis I at the battle of Pavia. The town has suffered much from earthquakes. SULPHA DRUGS: see Sulfonamides, The

SULPHONIC ACIDS, organic acids containing sulphur and having the general formula, R.SO<sub>2</sub>H, where R is either an alkyl or an aryl radical. (See CHEMISTRY: Organic Chemistry.)

Aromatic Sulphonic Acids -The acids of this more important group are obtained generally by treating aromatic compounds with concentrated sulphuric acid, the process being called sulphonation. Such operations are frequently conducted on a manufacturing scale as in the preparation of the sulphonic acids of benzene (q.v.), naphthalene (q.v.) and anthraquinone (q.v.). The sodium salt of benzenesulphonic acid is of importance since on fusion with sodium hydroxide it yields sodium phenoxide, from which phenol is liberated by a strong acid. During World War I large quantities of synthetic phenol were made by this process in order to eke out the supply of coal-tar phenol, which was then inacid (q.v.). From then, the process retained its importance in consequence of the large demand for phenol in the manufacture of synthetic resins and plastics (q v). Benzenedisulphonic acid, made from oleum (fuming sulphuric acid) and benzene, yields by alkali fusion the unportant dive intermediate, resortion)

The sulphonic acids of naphthalene are manufactured on an extensive scale, for by alkali fusion naphthalene.—sulphonic acid, made by low-temperature sulphonation, yields \( \alpha \)—naphthol, whereas naphthalene-\( \beta \)—sulphonic acid, prepared at 165° C, when similarly treated, furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, prepared at 165° C, when similarly treated, furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, prepared at 165° C, when similarly treated, furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, and a similarly treated furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, and a similarly treated furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, and a similarly treated furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, and a similarly treated furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, and a similarly treated furnishes \( \beta \)—anaphthalene-\( \beta \)—sulphonic acid, anaphthalene-\( \beta \)

Anthraquaone, the oxidation product of anthracene (q.v.), when subplomated with oleum at high temperatures yields anthraquione, β-subplomated with eleum at high temperatures yields anthraquione, β-subplomated with eleum at the which ('silver sait') is an important intermediate used in the manufacture of aliazam (q.v.) and the indanthrene vat dyess (See Drss, Syntherica. Sulphonation of anthraquionoe is facilitated by a mercuric subplate catalyst, and in this way anthraquionoe.1-q. and -1:3ed silviphoma cards are also used as intermediates in the dye modistry Sulphonation may be effected by chlorosulphonic acid whereby sulphonyl chlorides are formed. (See SACHARN). In addition to direct sulphonation, the sulphonic group may be introduced into the anomatic nucleus through the disapproaches of the produced formed the sulphonation.

Sulphonic acids of aromatic hydrocarbons are very soluble in water and when obtained crystalline are extremely hygroscopic. With phosphorus pentachloride they yield sulphonyl chlorides, which are reducible to thophenols. On distillation with sodium cynaide or ferrocyanide the softium arylsulphonates give rise to utriles, and on fusion with sodium hydroxide, they lead to phenols (see above.)

Sulphanilic acid, a sulphonic acid of aniline, is sparingly soluble in cold water and is to be regarded as an internal salt.

# <sup>†</sup>NH₃.C₀H₄.SÕ₃.

Its amide is important as the simplest member of the medically important sulfonamides (q,v). Sulphanilic acid and the similar naphthylamine sulphonic acids are important due intermediates

Albhaic Sulphone Acids are less important than those of the aromatic series. They are obtained generally (1) by oxidation of meraptans, alkyl dissulphides, alkyl thiocyanates or alkyl sulphine acids. (2) by the interaction of alkyl indices and metallic sulphites, (3) by the action of sulphusyl chloride SO<sub>2</sub>Cl<sub>3</sub>, upon a saturated hydrocarbon in the presence of light and of a catalyst such as pyridine, (4) by the action of sodium bisulphite upon an oleine in the presence of oxygen or other oxidating agent. They are dither viscous liquids or crystalline solids, converted into suit.

phonyl chlorides by phosphorus pentachloride. Hydroaromatic Sulphone, deids — Camphor yields a characteristic sulphonic acidio — Camphor yields a characteristic sulphonic acid on sulphonation with sulphuric acid in acetic annydride. The optically active camphor sulphonic acids from dextro- and laevo-modifications of camphor have been very useful in the resolution of racemold bases. (See STREROCHEMISTER)

(G, T. M.; X.)

SULPHUR, a nonmetallic chemical element, was discovered

nn prehistoric times. Its name is derived from the Latin word subpharum. It is often called branstone (burning stone), and signified subphar is mentioned in the earlier records of many countries as having been used for religious ceremonies, for purifying (fungating) buildings and for blesching cloth. The Romans also used it in medicine and in warfare. During the middle ages the (plenishs regarded subpharus as the principle of combustibility (philostone).

It was first classified as an element by Antoine Lavoisier in 1777 but many of his contemporaries considered it a compound of hydrogen and oxygen. Joseph Gay-Lussac and Louis Thénard finally proved it an element in 1809

Occurrence.—The earth's crust, according to F. W. Clarke, contains oc69, of sulphur as sulphides, sulphates and elemental sulphur. As elemental or native sulphur, it occurs chiefly in sedimentary and volcant deposits. Most of the world's production of sulphur is from sedimentary deposits and the majority of that from the calcareous horizons of the cap rock of shallow salt domes in the coastal region of Texas and Louisana, U.S. Italy, chiefly Scilly, is the only other large producer from sedimentary deposits Volcanic sulphur, widely distributed throughout the world, occurs and the control of the cont

In combination, the element occurs chiefly as sulphides and subplates. The former are of importance as a source of sulphur,  $e\,E_j$  pyrite (FeS.), marcaste (FeS.), pyrrhotite (FeS.), chalco-pyrite (CuFeS.), galena (PhS.) and sphalerite (ZnS.). The chiefly sulphates are anhydrite (CaS.O.), gypsum (CaS.O.)+2H.O.) and that (BaS.O.) also known as barytes or heavy spar. Sulphur also occurs in organic substances,  $e\,E_j$ , hair, wool, albumen, garlic, mustard, horse-radish, cabbage and many proteins.

Production.-Ancient producers described their method of obtaining sulphur from its ores as purification by fire Similar methods are still used in Sicily where native sulphur ore, mined by conventional methods, is piled in open cylindrical kilns (calcaroni), covered with spent ore and ignited Heat from burning about one-third of the sulphur melts the remainder which drains from the kilns and is cast into blocks. Somewhat better sulphur recovery is obtained in other kilns (Gill furnaces) constructed so that combustion gases from one kiln can be used to preheat the ore in In Japan, sulphur is usually distilled from the ore in another retorts Sulphur ores may also be heated with steam or superheated water in autoclaves. The sulphur melts, drains from the gangue and is recovered in the liquid state. Some sulphur is recovered by this method in the western part of the United States but after 1903 nearly all U.S sulphur was produced by the Frasch process from the deposits located near the Gulf of Mexico in Texas

All the sulphur deposits mined by the Frasch process occur at dopths of soo ft. to apoo ft. in the cap role of said domes. In horazontal section, the domes are circular to elliptical in shape. Surrounding and overlying the domes are clay, said and gupbo. The upper portion of the dome consists of a porous cap rock which. The upper portion of the dome consists of a porous cap rock which is largely limestone and calcute, with an occasional trace of the carbonates and sulphates of the other alkalme earths. The sulphur occurs in the porous limestone in the form of rhombic crystats. Below the limestone is a stratum of massive anhydrite which in turn overliges the rock-sail core of the dome.

Crystalline sulphur melts at about 116° C. The Frasch process takes advantage of this fact and fuses the sulphur underground by pumping water heated above this temperature into the deposit,

The melted sulphur, which is almost chemically pure, flows away from the gangue and is pumped to the surface

In mining, wells are drilled into the sulphur formation using rotary rigs such as those employed in the petroleum industry. The wells are equipped with pipes of various sizes placed concentrically which reach from the surface of the ground into the sulphur deposit A 6-in, pipe extends through the sulphur-bearing stratum and rests in the upper portion of the underlying calcium sulphate or gypsum A 3-in pipe is placed inside the 6-in pipe, reaching nearly to the bottom of the sulphur-bearing rock but resting on a collar that is set within a 6-in, pipe and seals the annular space between the two. Finally, a 1-in air pipe, inside the 3-in, pipe, extends to a depth slightly above the collar The 6-in, pipe is perforated at two levels, separated by the collar, the upper set of holes permitting the escape of hot water and the lower the entrance of molten sulphur

Hot water is pumped down the annular space between the 6-in and 3-in pipes and discharged into the porous formation through the perforations already described. The entire region through which the water circulates is raised to a temperature above the melting point of sulphur The melted sulphur, being heavier than water, settles and forms a pool around the foot of the well and, entering the lower perforations, rises in the 3-in pipe Compressed air, released at the bottom of the central 1-in, pipe, raises the liquid sulphur to the surface. Then the molten sulphur is pumped from the wells to near-by sumps, and from them to vats (bins) to solidify A completed vat, consisting of a solid block of sulphur, may be 1,200 it long, 50 ft. high and 160 ft to 200 ft wide and contain 500,000 tons of sulphur.

The sulphur production described is that obtained in elemental form from natural deposits After 1920, various schemes were devised for extracting sulphur from pyrites, coke-oven gas, smelter fumes and hydrogen sulphide By-product sulphur, as this type of sulphur is called, has been produced in Canada, Germany, Norway, Portugal, Spain, Sweden and the United States.

### PHYSICAL PROPERTIES

The element sulphur, chemical symbol S, exhibits nonmetallic properties, has an atomic number of 16 and chemical atomic weight 32 of It occupies the position immediately below oxygen in Group VI of the periodic table Four stable isotopes are known, each with a nucleus containing 16 protons, but differing by having 16, 17, 18 and 20 neutrons respectively. The respective mass numbers are 32, 33, 34 and 36, and the normal composition of sulphur is given as S<sup>32</sup> (95%), S<sup>38</sup> (074%), S34 (4 2%), S28 (0.016%). Two radioactive isotopes S31 (half life 3 2 sec ) and Sat (half life 87 1 days) have been prepared. The arrangement of the electrons in the outer shell of all atoms is represented as follows: 152, 252, 2p6, 352, 3p4.

Pure solid sulphur has a pale yellow colour but its naturally occurring forms may be sulphur yellow, straw or honey yellow, yellowish brown, greenish or reddish to yellowish gray Just above the melting point sulphur is a transparent yellow liquid which, with increasing temperature, turns dark red and becomes black at 230° C. At the boiling point (444.6° C) vapours are generated which turn deep red at 500° C. and a straw yellow at 850° C.

Sulphur is tasteless and odourless. It has no action on the skin. It is insoluble in water, highly soluble in carbon disulphide, moderately so in aromatic solvents and indifferently so in aliphatics. The liquid density varies from 1.808 g per millilitre at 115° C. to 1.599-1.614 g per millilitre at the boiling point. At 200° C. (reduced pressure) the vapour density corresponds to Se molecules, at 600° C. to Se, at 1,000° C. to S1 and at 4,000° C. to monatomic Increased pressure decreases the dissociation of the sulphur. Increased pressure decreases the dissociation of the vapour. The critical temperature is 1,040° C. The latent heat of vaporization decreases from 84.8 cal. per gram at 120° C. to 68.r cal. at 360° C. and then rises to 73.9 cal. at 540° C. The latent heat of fusion is 9 21 cal. per gram (x18.9° C.).

Sulphur is a poor conductor of both heat and electricity and becomes charged negatively if rubbed with glass, fur, silk, wool or hard rubber. On Mohs' scale, its hardness varies from 1.5 to 2.5. The vapour pressure varies from 0.0002 mm. of mercury at

50° C to 3,824 mm at 570° C The coefficient of thermal expansion continuously increases with temperature for the solid while that for the liquid passes through a minimum value. The bond angle, the interatomic distance and the atomic radius for crystalline St are 105°, 2 12Å (Å, the Angstrom unit=10-8 cm.) and 1 04 Å, respectively For the Sagas the bond angle is 100° but the other two values are the same as for the solid The ignition temperature of sulphur in air is 261° C.

Allotropic Modifications.—A number of crystalline forms of sulphur have been identified by their external appearance and optical properties These, according to D M Yost and H Russell. Ir.

arranged in their suggested order of stability are:

 $S_{\theta}$  (tetrahedial) $\rightarrow S_{\theta}$  (monoclinic) $\rightarrow S_{\eta}$  (monoclinic) $\rightarrow$  $S_{\rho}$  (monoclinic)  $\rightarrow S_{\rho}$  (monoclinic)  $\rightarrow S_{\theta}$  (the usual

monoclinic sulphur) = Sa (rhombic sulphur)

These forms differ in external appearance, crystal structure and physical properties, e g , density, solubility and melting point. Of the allotropic forms, the two most important are rhombic (a, S., or S,) and monoclinic (B, SB, or SI)

Thermodynamically, rhombic sulphur is stable at room temperature and is readily obtained by crystallization from solution in carhon disulphide It is a yellow solid with a density of 207 g per millilitre and melting point 112.8° C. (if heated rapidly) Above 95.5° C, the transition temperature, the crystals become opaque and consist of aggregates of the monoclinic form An X-1ay investigation of rhombic crystals has shown that the unit cell is composed of 16 puckered rings of St molecules arranged approximately

in layers perpendicular to the C-axis

Monoclinic sulphur is obtained when molten sulphur is cooled slowly On breaking the surface crust and pouring off the still liquid sulphur, the interior of the cooled mass will be found to be filled with needlelike, monoclinic crystals. The density of the monoclinic sulphur is 1 96 g. per millilitre and its melting point is 119° C Under higher pressures, the two forms can only coexist at a definite temperature for any particular pressure (i e., the transition point is raised), and if the pressure is raised while temperature is kept constant, the rhombic form is produced since it is the more dense This balanced state of affairs continues to 151° C. and 1,288 atm.; above this temperature and pressure the monoclinic form cannot exist. The atomic heat of transition is on call

On standing at room temperature, monoclinic sulphur slowly changes into rhombic sulphur but the outward monoclinic crystalline form is preserved, each monoclinic crystal consisting of an aggregate of very small crystals of rhombic sulphur Commercial varieties of sulphur such as ordinary brimstone, roll sulphur and flowers of sulphur consist mainly of the rhombic form and a small amount of insoluble or amorphous sulphur.

Carbon disulphide dissolves both rhombic and monoclinic sulphur, 100 g, of it dissolving 50.4 g, of rhombic sulphur at 25° C., 100 g. at 40° C. and 376.1 g. at 80° C. At 0° C., however, the monoclinic form is 1,28 times as soluble as the rhombic and at 25.3° C. it is 1.4 times as soluble. The molecular weight of both forms in this solvent corresponds to Sa Another very good solvent for rhombic or monoclinic sulphur is sulphur monochloride, SiCl2.

Rhombic sulphur melts at 112.8° C.; monoclinic sulphur melts at 119° C. but the natural melting point of commercial sulphur is a few degrees lower. This is because liquid sulphur consists of a mixture of two or three molecular species and time is required before equilibrium is established between them. At 120° C. liquid sulphur has a viscosity of approximately 10 centipoises; further heating causes the viscosity to drop to a minimum at about 157° C At 159° C to 160° C, the viscosity increases rapidly to a maximum of 932 poises at 186° C, to 188° C after which it again decreases

Various explanations have been given for the peculiar viscosity of liquid sulphur. At lower temperatures near the melting point it is supposed that the Sh or Sh molecule predominates. As the temperature is increased to 160° C., the eight-membered ring molecules rupture, giving an equilibrium mixture of rings and eightmembered chains. The increasing concentration of these eightmembered chains causes polymerization to long complicated chains In addition to the long straight cham, it is highly possible that side chains of varying lengths exist. A maximum chain length of 12,000

SULPHUR 542

atoms to 27,000 atoms is attained at approximately 187° C, above which the polysulphur chains break into shorter chains In addition to Sx or Sx, and Sw or Sx, still another molecular species of sulphur S, or S4, is believed to exist in both the liquid and in the rapidly cooled solid. The percentage of S, at 120° C is approximately 3 5% and at 170° C., close to the temperature of maximum viscosity, it reaches a maximum of approximately 68%. Sx is soluble in carbon disulphide while S, and S, are not

If hot, molten sulphur is poured into water it forms a clear, soft, sticky, elastic mass known as plastic sulphur X-ray analyses show a fibre diagram and it is believed that long chains of sulphur atoms are arranged parallel to the direction of stretching. The stressstrain curves for these elastic strings appear very similar to those given by raw rubber Plastic sulphur becomes opaque and brittle after a few days because of the conversion of most of the S, and some of the S, into crystalline rhombic sulphur When treated with carbon disulphide, only part  $(S_{\lambda})$  of this hardened sulphur will dissolve, leaving amorphous or insoluble S., and S.

Other allotropic forms have been reported, such as gamma sulphur (γS, Muthman's S<sub>111</sub>, nacreous sulphur) This form, mixed with S<sub>a</sub> and S<sub>B</sub>, is prepared by the crystallization of molten sulphur as it is cooled to 90° C. It is also formed by the slow diffusion of aqueous solutions of sodium thiosulphate and potassium hydrosulphate The vellowish-white monoclinic crystals have a mother-of-pearl lustre with axial ratios different from those of beta sulphur, Colloidal sulphur (delta sulphur, Muthman's Siv), showing no sign of crystal structure, is formed when hydrogen-sulphide gas is passed into a saturated aqueous solution of sulphur dioxide at o' C or when an alcoholic solution of sulphur is poured into water Other forms reported are theta sulphur (0S), which is an unstable pale-yellow tetragonal form; zeta sulphur (\$8), which is a colourless rhombic plate crystal, and eta sulphur ( nS ), which is colourless, double refracting hexagonal plates

### CHEMICAL PROPERTIES

All the metals except gold and platinum combine with sulphur to form sulphides and, in most cases, heat is given off during the union. Moist sulphur is slowly oxidized at ordinary temperatures to sulphuric acid In combination with metals and hydrogen, sulphut has a valence of -2, forming compounds like HiS, FeS, CuS and HgS In combination with nonmetals, however, the valence or oxidation state may be +4 or +6 as in SO2 and SO2 respectively. Sulphur is therefore an oxidizing agent as well as a fair reducing agent. Its oxides are acid-forming,

Sulphides,-Hydrogen sulphide (H2S) is formed by the reaction of hydrogen with molten sulphur at 200° C. to 400° C and with sulphur vapour at temperatures up to 800° C. It is also formed by the action of acids on metallic sulphides such as ferrous sulphide, FeS+2HCl-FeCl2+H2S, by putrefaction of organic substances containing sulphur; by the destructive distillation of ceal; and by heating sulphur with hydrocarbons such as paraffin,

petroleum oil, methane, etc.

Hydrogen sulphide, a colourless gas having the odour of rotten eggs, is fairly soluble in water giving a feebly acidic solution which slowly deposits sulphur when exposed to air. This gas, poisonous when inhaled, burns in air with a pale-blue flame to give sulphur dioxide and water. It can be liquefied at 18° C. by a pressure of 17 atm., the liquid boiling at -60 1° C under atmospheric pressure and solidifying at -82 9° C. Hydrogen sulphide, often used as a reducing agent, is oxidized by the halogens to sulphur, excess halogen oxidizing the sulphur to sulphuric acid; by hydrogen peroxide to thiosulphate and finally, to sulphate; and by concentrated sulphuric acid to sulphur and sulphur dioxide

Hydrogen persulphide, H<sub>0</sub>S<sub>4</sub>, density 1.3339 (20° C.), melting point -89,6° C., boiling point 70.7° C. (± .5), is prepared by decomposing a polysulphide with a strong acid, as by treating Na2S2-5 with hydrochloric acid. Hydrogen trisulphide, HaSs, may be ob tained as a by-product in the reaction. The compounds H2So and H2Se have also been described. The persulphides all dissolve

readily in organic solvents.

The hydrogen atoms in hydrogen sulphide can be replaced by metals to form the normal sulphide, MaS, or the acid sulphide,

MHS. Sulphides of the alkali metals dissolve readily in alcohol. and in water and are used in the paper and leather industries Many sulphides, those with high heats of formation, can be made by grinding the metal and sulphur Others require heating; in some instances a high temperature is necessary to start the reaction Sulphates, especially those of the alkali and alkaline earth metals, can be reduced to the sulphides by heating with carbon Heavy-metal sulphides, which are all highly insoluble in water (being among the most insoluble of all substances), can be made also by passing hydrogen sulphide through solutions of metal salts This precipitation with hydrogen sulphide is used in qualitative analysis

The sulphides of the heavy metals have a characteristic appearance and colour Some are volatile at moderate temperatures, mercuric sulphide subliming at 446° C They can be iodized in air, and many are hydrolyzed by water with the evolution of hydrogen sulphide Some metallic sulphides containing small amounts of heavy-metal salts are phosphorescent. Zinc sulphide is used in luminous paints and, combined with traces of a radium sale, it is used for painting the figures on luminous watch dials.

Thio Salts .- Metallic sulphides react with sulphides of the more negative elements (3Na<sub>2</sub>S+P<sub>2</sub>S<sub>5</sub> >2Na<sub>2</sub>PS<sub>4</sub>) to give thio salts or sulpho-salts This reaction is used analytically to separate

As, Sb, Sn from Cu, Pb, Bi, Cd and Hg

Polysulphides.-Sulphur combines with simple sulphides like Na2S or NaSH to form polysulphides having the general formula Na2S, in which x values from 2 to 5 (Some Na2Se is formed in liquid ammonia solution.) The polysulphides, well-crystallized hygroscopic solids which are oxidized by air to form thiosulphates. are used by the tanning industry. Lime-sulphur solution, consist me of calcium sulphide and polysulphides, is made by boiling sulphur with a suspension of lime and is used both as an insecticide and as a fungicide

The sulphides of carbon, silicon and boron are obtained by direct union of sulphur with these elements at high temperatures. CS2 is unimolecular It boils at 46 25° C., while SiS2 and B2S2 are solid compounds which are difficult to volatilize Both of the latter, in contrast to CS2, burn in oxygen with difficulty SiS2 and B2S3 are hydrolyzed by water CS2 is important commercially. being used in the preparation of viscose rayon and carbon tetrachloride and as a solvent. Other sulphides such as CS, CaS2 and SiS are also known. The former, a solid, is prepared by the action of a silent electric discharge on the vapour of CS2. Carbon and silicon also form sulphides which contain oxygen or a halogen Carbon oxysulphide, COS, is always formed when carbon, oxygen and sulphur are brought together at high temperatures physical properties, carbon oxysulphide is intermediate between CO2 and CS2 It is a colourless, odourless gas which condenses to a hquid at -47.5° C.
Nitrogen Sulphides.—Another series of compounds is the sul-

phides of nitrogen. Nitrogen sulphide, NS2, is a red liquid. The tetrasulphide, N4S4, a yellow or orange-yellow solid, melting point 179° C., is prepared by passing ammonia through SCl2 dissolved in benzene or by dissolving sulphur in liquid ammonia at -15.5° C. The material explodes when struck. The pentasulphide, N<sub>2</sub>S<sub>5</sub>, a red liquid with a melting point of ro° C., is obtained when the tetrasulphide is boiled with CS2 Nitrogen tetrasulphide has been suggested for use as an ignition promoter in diesel fuels and as an insecticide and fungicide.

Oxides of Sulphur .- Sulphur burns readily in air to form  $SO_2$  and traces of  $SO_3$ .  $SO_2$  may also be easily prepared by treating sulphites or bisulphites with a strong acid:  $Na_2SO_3+2HCl \rightarrow$ 2NaCl+H2O+SO2. It is available in the liquid form, boiling point -8° C., melting point -72.7° C., at low cost in steel cylinders. It finds many important commercial uses, being used as a bleaching or reducing agent, a refrigerant and a solvent.

Sulphur monoxide, known only in the gas phase, may be prepared by subjecting a mixture of SO2 and sulphur vapour at a pressure of from 1 mm to 10 mm, to an electric discharge. It may be condensed to a solid at liquid-air temperatures but on melting it converts into SO2 and sulphur.

Sulphur trioxide, SO3, is formed by heating SO2 and oxygen in

the presence of a catalyst such as finely divided platinum, nickel or cobalt sulphates, or the oxides of vanadium, tungsten, molyb denum, chromium or iron This reaction is the basis of the contact process for the manufacture of sulphuric acid (q v) may also be prepared by heating anhydrous ferric sulphate, Fes-(SO4)3, to 600° C to 700° C or by allowing SO2 and ozone, O2, to come together at room temperature Two other oxides of sulphur, S2O3 and SO4, are known, and S2O7 has been described sesquioxide, S2O3, is formed on adding powdered sulphur to liquid sulphur trioxide at 15° C It is a blue to blue-green solid which decomposes slowly into SO<sub>8</sub>, SO<sub>2</sub> and S Sulphur tetroxide, SO<sub>4</sub>, a white solid, is prepared by subjecting a mixture of SO2 and O2 to a silent electric discharge In the gas phase, SO2 consists of monomeric molecules but in the liquid state, boiling point 46° C, it consists of a mixture of SO2 and S4O9 molecules and perhaps others It also exists in several solid modifications the alpha or icelike modification, the beta or low-melting asbestoslike modifications and the gamma or high-melting asbestoslike form molecular composition of liquid and solid SO2 has not been completely investigated. SO2 reacts energetically with organic matter to form sulphonic-acid derivatives of carbon and SO2, and with basic oxides to form sulphates In liquid form it combines with NO2 to form oxynitroso sulphuric anhydride, (NO2SO3)2, and with water to form a series of hydrates of sulphuric acid

The oxides of sulphur dissolve in water to form acids The following list from Yost and Russell's Systematic Inorganic Chemistry of the Fifth-and-Sixth-Group Nonmetallic Elements (copyright, 1944, by Prentice-Hall, Inc. New York) contains all the definitely established oxyacids of sulphur Where the free acid is not known, the fact is indicated by giving the formula of a known salt of the acid in parenthesis In each case a method of prepara-

tion of the acid or salt is given.

The sodium salt of hyposulphurous acid, sodium hyposulphite, is an article of commerce and is used as a reducing agent in the dye industry Sulphurous acid and its salts are excellent and cheap reducing agents and are also used as disinfectants and food preservatives Calcium bisulphite and magnesium bisulphite are used to extract lignin from wood in the preparation of wood pulp Thio-

sulphates are used extensively in photography.

The Halides and Oxyhalides of Sulphur.—The halides and oxyhalides of sulphur, as described by Fritz Ephraim, possess certain properties in common. They are all readily prepared, usually by several methods. All are either gases or volatile liquids. Except for the fluorides, which exhibit great stability, all hydrolyze readily to give acid products which are irritating to mucous membranes. Again, except the colourless, tasteless fluorides, these compounds possess a pungent odour. As one might expect, the physical properties, reactivity and stability of these materials vary regularly with the position of the halide in the periodic table as illustrated in Tables II and III. Sulphur monochloride and sulphur dichloride are used to vulcanize rubber. The oxychlorides are useful reagents for the introduction of sulphoxide, sulphone or chlorine groups into organic molecules. Chlorosulphonic acid, HSO3CI, prepared by reacting HCl directly with sulphur trioxide, reacts readily with water to form sulphuric and hydrosulphuric acid. It fumes in air and has found application as a smoke producer in military operations Its most useful application is in organic chemistry where it serves as a sulphonating agent,

Organic Chemistry of Sulphur.-The organic chemistry of sulphur may be divided into reactions which occur under reducing conditions and reactions which occur under oxidizing conditions. TABLE II -Properties of Sulphur Halides

1959, 1951, 1957, by permyssion of the publisher, C. D. Hodgman, Proprietment Publisher, C. D. Hodgman, C. C. Brown, C. C. Brown, C. C. Brown, C. C. Brown, 
The first type is encountered when elemental sulphur is heated with petroleum hydrocarbons, rubber or other organic substances, The organic material is sulphurized and hydrogen sulphide is formed as a consequence of sulphur's action as a dehydrogenation agent The hydrogen sulphide, being a reducing agent, may induce further reactions particularly with unsaturated compounds, to yield mercaptans and thiophenols which in turn may be alkylated to sulphides, e g, mustard gas. All such sulphur compounds are analogous to similar compounds of oxygen, but differ from them because of dissimilarities in the respective molecular weights and electronic structures. The additional shell of electrons possessed by sulphur may lead to the formation of polysulphides such as the thickol-type synthetic resins. The resistance of these resins to attack by gasoline has led to their use as linings for aircraft fuel tanks The aromatic sulphur compounds, usually nitrogen derivatives, find extensive uses as accelerators in the vulcanization of rubber. The second type of reaction, oxidation of organic sulphur compounds, yields materials which, with the exception of the disulphides and the peroxides, are not analogous to oxygen compounds with respect to structure. The most important of these compounds are the sulphonic acids and their derivatives which are used extensively as medicinals (sulfa drugs), detergents, lubricants and dyestuff intermediates Sulphones, sulphoxides and sulphinic acids are less useful but give promise of greater utility in the future.

### COMMERCIAL FORMS AND USES

Crude Sulphur or Brimstone.-The form of crude sulphur on the United States market is 99.5% to 99.9% pure and free from arsenic, selenium and tellurium. As shipped, it contains about 50% fines with lumps 8 in. or more in diameter. Italian sulphur was marketed in four grades known as best seconds, best thirds. good thirds and current thirds and ranging in sulphur content from 99.5% down to 96.0%. Japanese sulphur was usually marketed in the form of cylindrical bars, each containing slightly more than one cu. ft. of 99.8% to 99% sulphur and weighing 130 lb. to 150 lb. Broken-rock bilmstone is sublimed or refined sulphur broken and sold as a mixture of lumps and fines — It has uses similar to roll sulphur.

Colloidal sulphur is sulphur in such small particles that it remains suspended in water. Colloidal sulphur may be prepared by intensive grinding but is usually prepared by chemical means. The uses are mainly pharmaceutical.

Commercial flour sulphur is produced by grinding crude sulphui Its fineness is 50% to 99% through 200-mesh or 99% through 300-mesh Uses vulcanizing rubber, dves, gunpowder, insecticides

and fungicides

Flowers of sulphur is crude sulphur refined by sublumation. It contains from 25% to 30% "amorphous" sulphur, and 90% of it will pass through a roo-mesh sieve Uses chemicals, vulcanizing rubber, insecticides, fungicides and pharmaceuticals (especially after washing with ammonia to remove all traces of acid.

Lac sulphur, precipitated from polysulphide solutions by sulphuric acid, contains up to 45% calcium sulphate. The uses are

mainly pharmaceutical

Precipitated sulphur is precipitated from polysulphide solution by hydrochloric acid and washed to remove all calcium chlonde. The uses are mainly pharmaceutical. Roll Sulphur is refined sulphur cast into convenient sizes, also

known as stick or cannon sulphur Uses chemical, burning for cuing, fumigating and preserving or bleaching effects

Uses .- The uses of sulphur are many and varied Often it is considered, along with salt, coal and limestone, as being one of the four basic raw materials of the chemical industry. The major portion of it is burned to form sulphur dioxide for use in producing wood pulp, for bleaching and for conversion to sulphuric acid, But sulphur, because of its interesting properties, is also applied to many other uses Combined with an aggregate, it is used to make acid-resistant cements. It is used to impregnate paper and other porous materials to produce useful articles of commerce Sulphur ointments have been used in treating skin affections and sulphur compounds are used to treat a variety of diseases. It is used as an insecticide or fungicide in the control of insects and fungus diseases of plants and animals. A further use, not commonly recognized, is as a plant food Sulphur and its compounds are used both as direct and indirect fertilizers. As indirect fertilizers, sulphur and its compounds have various functions, including the correction of alkali soils, reaction with soil constituents and release of the nutrient elements, soil amelioration resulting from the flocculating effect and the control of the reaction of the soil.

## ANALYTICAL METHODS

Free Sulphur is determined by extraction with carbon disulche. Amorphous sulphur, present in sublimed sulphur, is not soluble in carbon disulphide but is rendered soluble by heating samples at 10°°C. to 10°°C for 18 hr. Moisture in Commercial Sulphur is determined by drying a

Moisture in Commercial Sulphur is determined by drying a 50 g, sample at 80° C. for it 6 hr. in a wide-mouth weighing bottle. Ash in Commercial Sulphur is determined by burning 10 g, to 50 g, of the sulphur in a porcelain crucible using sufficient auxiliary heat to keep the sulphur burning and finally igniting the crucible to destore all organic matter.

Arsenic, Selenium and Tellurium in Sulphur are determined by first oxidizing the sulphur to sulphuric acid through the use of bromine and nitric acid. Arsenic is then determined by the Gutzeit method, selenium by reduction with hydrazine sulphate and tellurium by reduction with stannous-chloride solution.

Combined Sulphur may be determined by converting it to a soluble sulphate and precipitating it as barium sulphate by the

addition of barium chloride,

Bouncou of Bartun Guerrie.

Yost and Haynes, Edwisell, Jr., Systematic Integrate Chemistry of the Fifth-and-State-Great Normalial Edwards (New York, 1944), Fritz Sphraim, Paregine Chemistry ed. by F. C. L. Thome and E. R. Roberts (London, 1944).

SULPHUR, SPECIAL APPLICATIONS OF. Sulphur is a convenient source of sulphur dioxide was which is the basis

for the manufacture of sulphuric acid and sulphite pulp. In a number of industries sulphuri plays an essential part and his substitute. This is also the case, moreover, in various agricultural and horticultural fields, it being used in insecticides and funges, and for the making of time-sulphur solutions. Among the properties of sulphur are fusibility, acid resistance, a number of plays cal forms, extremely low electrical conductivity and general chemical resistance. There are few solvents for sulphur and it is acid resistance. There are few solvents for sulphur and it is acid them acid upon by water, but for certain purposes its inflammability is detrimental.

As an Impregnant.—All forms of pulp and paper products can be impregnated with motion sulphur and the more absorbent types take up three or four times their dry weight. Preformed uplu and paper articles, when impregnated with sulphur become very strong, weather resistant and converted into much denser and harder maternals. Among the applications of such paper products are flat fibre boards so treated as to prevent warping and make them resistant to acid and other destructive agencies. Spoolheads, advertising signs and other articles of paper, fibre or pulp can be hardened and weatherproofed by sulphur impregnation

Practically all species of wood may be impregnated with molten sulphur under proper conditions, the more resistant species requiring the application of vacuum and pressure procedure is very similar to that so widely used for the creosoting of wood, but the effect is quite different. With sulphur there is very little change in colour, but a marked increase in weight and a phenomenal hardening and strengthening effect. Pieces of soft wood with a high sulphur content appear almost as though petrified. It converts a soft wood into a very hard and durable product, comparing favourably with the heaviest and densest tropical woods. By the addition of various sulphur soluble dyes, attractive colours are imparted Wood so treated is much less absorbent to moisture and withstands the action of acid and other destructive agencies. Tests made on wood structures in contact with the ground indicate that sulphur acts as a preservative even though not in itself particularly toxic. Its toxicity toward wood-rot fungi may be increased by the addition of certain substances that are recognized preservatives and which have been found to be miscible with molten sulphur The applications for sulphur-treated wood are numerous and include floor blocks, especially where acids are used, fence posts, railway ties, etc. Stone and concrete are likewise subject to sulphur impregnation.

Textiles and fabrics may likewise be impregnated with sulphur and have the advantage of being readily formed or shaped before processing. Fabric coverings saturated with molten sulphur may be spirally wound on metal pipes or other objects in order to

produce extremely dense, impervious coverings.

Sulphur Introders.—The term "introder" has been applied to certain organic substances having a most peculiar effect on the penetrance of molten sulphur. They may be used to advantage in practically all the examples of sulphur impregnation heretofore described and are also valued in making certain sulphur compositions. Some of the substances which not only increase the rate but the ultimate limit of penetrance of molten sulphur are naptialene, its chlorinated and hydrogenated derivatives, anthracene, tripheral phosphate and other community.

triphenyl phosphate and other compounds.

Other Special Uses.—In view of the fact that one of the problems of the steel industry is the removal of sulphur, it is interesting
to note that it is deliberately added to steel for special purposes,
notably for the making of screw stock. Likewise, in petroleum remining, sulphur compounds present in many crude oils must be removed to make them fit for refining. But for some uses an oil containing sulphur is desirable. This is the case with metal-cutting
oils, used largely by the metal-working industries for thread cutting, turret lathes and other machine work. Sulphur is mcorporated with an animal or vegetable oil base and subsequently added
in proper portion to a petroleum oil.

Sulphur cements which are applied hot, consist of sulphur with various inert mineral fillers and are useful for anchoring metal in stone, such as bolts in engine foundations, iron railings and the securing of chains to grantie blocks for buoys, setting electrical insulator pine doorhouds and a great many other numeass. They are particularly useful for pointing up acid proof blick in order to protect lime mortar, cementing floor blocks in acid-pickling rooms, the pouring of pipe joints both water and acid, and for setting bushings in abrasive wheels

Other uses for sulphur are the manufacture of sulphur colours, as a preservative for dried fruits and, in the form of tapers, for locating ammonia leaks and sulphuring wine casks In colloidal form, sulphur is valuable as an intravenous injection for the treatment of certain diseases, and as a recognized curative agent in dermatology, especially for scabies, ringworm, acne, favus, prungo and psoriasis The boiling point of sulphur, 444.6° C. is used in thermometry for scale determination, while molten sulphur is an excellent heating medium. Synthetic resins result from the interaction of sulphur or sulphur chloride with phenol, and it imparts the dark amber colour to glass bottles. Sulphur is used in making sheep and cattle dips, while it is admixed with the salt given to stock It is also used for the stoving of wood, and the sulphuring of hops, silks, sponges, feathers and other commodities and is employed for making plaster cast moulds. Sulphur compounds are used for the so-called oxidation of silver, bronze and other metals, as well as for the bleaching of brooms, straw, wicker furniture and the tanning of leather

Sulphur in its more complex phases, especially organic, is of industrial as well as biologic interest. Allyl isothiocyanate, a sulphur compound, is found in mustard oil and is responsible for the irritating action of the ordinary mustard plaster. An important derivative dichloroethyl sulphide, was brought into prominence during World War I as mustard gas Sulphur may be responsible for the efficacy of certain organic compounds used as flotation oils in the recovery of valuable ores. This is notably the case with the various xanthates. Cellulose xanthate is one of the products in the process of manufacturing artificial silk, or viscose rayon An alburninoid substance known as keratin occurs in practically all animal and human appendages such as hair, hoof, horn, fur, wool, feathers and nails, and, since the keratins are very high in cystine, human hair containing about 14%, its importance is readily seen, Various complex organic sulphur compounds play an important part in the human body, and are vital to our welfare and probably to life itself (WHK)

SULPHURIC ACID, HSO<sub>0</sub>, one of the most important and essential of all commercial chemical substances, is made from air, water and sulphur. Although rarely used or even seen by the layman, sulphuric acid is employed in some stage of the manufacture of practically all industrial products. The annual consumption in the United States by the 150s had reached approximately 13,000,000 tons, and, because of its extensive use, the quantity consumed from year to year serves as an accurate and sensitive index of general business conditions.

Sulphuric acid occupies its unique position of usefulness because it has an unusually wide range of properties and at the same time is one of the cheapest of the industrial chemicals to produce. It serves as a dehydrating and carbonizing agent, as a catalyst, solvent. absorbent, electrolyte and oxidizing agent. It is used in varying concentrations from the extremely dilute solutions for the control of acidity or alkalinity to the highly concentrated, fuming acids for the manufacture of drugs, dyes and explosives. It is made in various grades from those of high purity for the rayon and pharmaceutical industries to those of relatively low grade for the manufacture of superphosphate and ammonium sulphate for the fertilizer industries. The same acid is often used repeatedly. After initial use in the petroleum, explosives, drug or dye industries it is frequently recovered in a form too weak or impure for reuse in the same process but quite suitable for use in steel pickling or in the fertilizer industry. It may be made by two quite different processes, the contact and the lead-chamber process, while a large variety of sulphur-bearing raw materials are available for use in either process.

Properties.—Pure (100%) sulphuric acid is a colourless liquid which is sometimes called monohydrate of sulphur trioxide because its anhydride, sulphur trioxide (SO<sub>4</sub>) and water are combined in exactly equal miolar quantities (H<sub>2</sub>SO<sub>4</sub>=H<sub>2</sub>O+SO<sub>2</sub>). Its specific gravity is 1.893 at 15.6° C. (60° F.), freezing point 10.37° C.

100

(50°F) and at one atmosphere pressure it boils at about 340°C (644°F) but undergoes decomposition into subplur troaxed and water. The former escapes as a vapour until the concentration has fallen to §6 34% which is the composition of the constant totaling mixture of subplure acid and water at atmosphere pressure. The solution then distils at 317°C. (663°F), its boiling point. The freezing point of the acid is greatly affected by the addition of either subbut troaxed or water.

The existence of the crystalline phases H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>SO<sub>7</sub>, H<sub>2</sub>SO<sub>1</sub>, H<sub>2</sub>O<sub>2</sub> 2H<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>O has been established by a study of the freezing temperature changes The physical characteristics of the acid at several other concentrations are included in a later section.

in a later section Sulphuric acid is dibasic, that is, its molecules each contain two hydrogen atoms and ionize in two steps H2SO4=H++HSO4and HSO4" = H+ + SO4" The first stage of dissociation proceeds to a degree comparable to that of other strong acids but is exceeded slightly by the more highly dissociated hydrochloric and perchloric acids. The second stage of the dissociation is moderately weak, the constant being coro at 25° C. Solutions of various concentrations of the acid therefore may contain in addition to hydrogen ions (H+ or H2O+), molecules of the acid (H2SO4), bisulphate ions (HSO4-), and sulphate ions (SO4-) in proportions which vary with the dilution In very dilute solutions the concentration of the SO4= ion is equal to the stoichiometric concentration, that is, there is a SO4 ion for practically every molecule of H2SO4 which was originally added to the water. As the concentration of the solution is increased, the concentration of the HSO,rises rapidly; that of the SO4= increases more slowly and reaches a maximum value of two molar at a stoichiometric concentration of about seven molar. It then decreases to a very small value. virtually zero, in a solution of high concentration (14 molar) At this same high concentration (14 molar) the HSO4 is at a maximum value of 14 molar, that is, practically all of the acid has undergone primary ionization but no secondary ionization. At still higher molarities the HSO4- ion concentration diminishes as the H2SO4 increases

As a result of these variations in the concentrations of the various molecular species, the properties of aqueous sulphuric acid solutions undergo interesting changes, at the specific conductance reaches a maximum in the 4 miles of the specific conductance reaches a maximum in the 4 miles of the surface tension reaches a maximum with one of the surface tension reaches a maximum with the surface tension reaches a maximum when the surface tension concentration curved at about one molar concentration curved at about one molar concentration of the surface tension-concentration curved at about one molar concentration of the various components which result from the dissociation of the Ms50, molecules.

Dilute sulphuric acid reacts with the more electropositive metals such as zmc, magnesium and iron with the evolution of hydrogen. It also reacts with metal oxides, hydroxides and salts of the weaker acids, e.g., carbonates, acctates and sulphites forming sulphates.

In subburic acid the sulphur is at its maximum oxidation state of 6+; it may herefore function as an oxidizing agent and be reduced to the 4+ ( $SO_2$ ), zero (S) or  $z - (S)^-$  state. The ditute acid is not an effective oxidize but the hot concentrated acid oxidizes less active metals,  $e_{S}$ , copper and silver, as well as the non-metals, carbon to carbon dioxide, sulphur to sulphur dioxide and is itself reduced to sulphur dioxide, with stronger reducing agents as zinc or todiced it is reduced to hydrogen sulphide which under favourable conditions may escape before being oxidized by more of favourable conditions may escape before being oxidized by more of sulphides present in petroleum and dation the tars and organic sulphides present in petroleum and dation that the randition the sulphuric acid alkylation processes involved in the manufacture of high-octane aviation gasoline.

Because of its low aqueous tension and the stability of its laydrates the concentrated acid has great avidity for water and serves as an excellent drying agent and as a dehydrating agent, removing not only moistum from gases and liquids which do not react with the acid, but extracting water from compounds. Thus it chars many organic compounds such as wood, paper, cloth, starch and sugars For the same reason the acid becomes brown in colour if it comes in contact with traces of oil, grease or atmospheric dust. It is essential in the mainfacture of explosives, cellulod, lacquers, etc., for the nitration processes involved in these processes bherate water which is removed by the sulphuric acid thereby permitting the reactions to go to completion. Its value to organic chemistry is due also to its reaction with many aromatic compounds to form sulphonic acids (See Carbolic Actip.) PURS Synthetic Naphiti Hallowship.

Because of its high boiling point the concentrated and is used to manufacture volatile acids, some of them stronger than sulphuric and, from their sails. If liberates hydrogen chloride (hydrochoric acid in water solution) from sodium chloride, intra acid from intrates, and hydrofluoric acid from calcium fluoride. It is also used to convert calcum phosphate to a more soluble and phosphate for fertilizer and in solution displaces numerous weak ands, e.g., acide and born cards from their respective sails. Since brounde ion and odded ion are oxidized by the concentrated acid, it cannot be used for the manufacture of hydrobromic and

hydriodic acids.

Sulphates.—Since sulphuric acid is dibasic, it forms both normal or neutral salts (Na2SO4) and acid salts (NaHSO4). The latter show acid properties in solution due to the ionization of the HSO4- ion and are sometimes employed for purposes requiring moderate acidity The common sulphates are soluble in water with the exception of those of lead, strontium, barium and calcium, Many of the sulphates have important industrial uses, barium and lead sulphates in the manufacture of paints, sodium sulphate in the manufacture of paper, and its hydrate, Na<sub>2</sub>SO<sub>4.10</sub>H<sub>2</sub>O (Glauber's salt), in medicine; copper sulphate, CuSO, 5H2O, in insecticides and its solution as an electrolyte in the electrolytic refining of copper, gypsum, CaSO4.2H2O, and plaster of Paris, (CaSO4)2. H2O, in the building industries. The sulphates of potassium and aluminum crystallize from solution as a double salt, K2SO4 Al2- $(SO_4)_3$  24H2O which is called alum (q v). The term is also applicable to other double sulphates of similar crystalline form in which the potassium ions are replaced by other univalent ions, e.g., those of sodium or ammonium, and the aluminum ions by other trivalent ions, e.g., those of chromium or iron.

Grades and Terminology.—Since the concentration and density of subpaint acid are proportional in the range from 0% to 93,19%, the concentration may be determined fairly accurately with the aid of an hydrometer. The Baumé hydrometer, American modulus, is used by the industry in the U S, while in continental Europe it is employed with, a different modulus. The Twadedl hydrometer is used in the United Kingdom although there is an increasing tendency to express the concentration directly in per cent of R5SO, or of SO, rather than in the degrees of the hydrometer scale. Temperature corrections must be made for all hydrometer scale.

ter readings.

The 100%  $H_2SO_4$  is rarely shipped because of its high freezing point (see above); the 98%-99% acid which is produced in the contact process is frequently used and because of its somewhat lower freezing point may be shipped if care is exercised.

The 93.0% acid is a syrupy, oily liquid with a specific gravity of 1835; freemp point —34°C. (—39°F.), boling point 28°C. ((188°F.) and has a viscosity at 15.6°C. (60°F.) which is 24 times that of water at the same temperature. It is one of the most popular shupping concentrations because of its low freezing point and the fact that it does not substantially react on and corrode the conomnal steel containers at atmospheric temperatures. The name, oil of vitriol (ox) is used in the U S to designate this concentration of the acid because of its appearance and "biting" characteristics. In the United Kingdom and Europe, however, the term is used more generally to mean simply sulphuric acid. Thus, in the British Isles the following designations are used: brown oil of vitriol (b.o.v.), ordinary commercial 77%—80% acid; best brown oil of vitriol (b.o.v.), ordinary commercial 77%—80% acid relatively free from arsenic and other impurities; concentrated or rectified oil of vitriol (c.o.v., or t.o.v.), 39%—69% acid and wusually made by the contact process rather than by concentration or rectification of the more dilitic chamber acid. The term isamber acid may

sefer either to any acid produced by the lead chamber process or to the acid of the particular concentration 5c%-68% similarly produced. This more dilute acid sects with steel containers and as therefore rarely shipped in quantity. The term 5c% lead of (5c 18%) is frequently used for statistical purposes in the US Acids of still lower concentrations are sometimes prepared by dilution but must be shipped in the more expensive glass carboys or bottles.

Another popular shipping strength is the approximately 78% and because it is the maximum strength made by the chamber process and because its freezing point, — 10 8° C (12.6° F), is low. In cold climates the shipping concentration is often changed to 76% which acid has a still lower freezing point. The 76%—78% acid is not seriously corrosive to steel tank cars or tank trucks. The fertilizer midustry, one of the largest consumers of sulphunc acid, requires acid of only 68% concentration for the manufacture of supernhosbate

Oleum or furning sulphuric acid (also known as Nordhausen acid) is a solution of sulphur trioxide, SO3, in 100% sulphuric acid Its concentration is usually expressed as "per cent oleum," ; e , the percentage of free SOs dissolved in the acid and occasionally as the total percentage of SO<sub>3</sub> which includes both the free oxide and that combined with water in the HoSO4 Thus 100 lb. of 40% oleum contains 40 lb of SO3 and 60 lb of 100% H2SO4, or a total of 80 lb (80%) of SO2 free and combined. Addition of a lb, of water to the 100 lb of 40% oleum yields 100 lb of 100% HoSO4 For this reason oleum has an equivalent acid concentration greater than 100% H2SO4, that of the 40% oleum being 109% acid As sulphur trioxide dissolves in sulphuric acid in all proportions, the resulting oleums may have a wide range of concentrations When the two combine in equimolar proportions, pyrosulphuric acid, H2S2O2, is formed. This acid has the maximum melting point, 36 C. (96 8° F.), of all the compounds of the H<sub>2</sub>O-SO<sub>8</sub> system.

Sulphuric acid may also be designated by terms which refer to its purity, origin or use rather than to its concentration. Thus battery acid and electrolyte refer to acid of a quality suitable for accumulators or storage batteries, in the US the concentrations sold are either 50% Hi<sub>2</sub>SO<sub>4</sub> (specific gravity 14 0,0 73 g.10% (specific gravity 14 0,5). Brimstone or sulphur acid refers usually to acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather than from less pure 1 wm. acid produced from sulphur rather 1 wm. acid produ

terials such as pyrites, spent oxide, etc.

Mixed acid consists of intric acid and oleum or concentrated sulphuric acid. Spent acid is that which has been used once and is usually dilute and impure Studge acid is the residue of the acid used in the refining of petroleum. It is contaminated with organic impurities and is frequently made usable by further dilution to separate as many as possible of the impurities followed by concentration; or it may be decomposed by heat, the organic material oxidized and the sulphur dioxide recovered for use in the manufacture of more acid. Spent allylation acid is a by-product of sulphuric acid alkylation processes for the manufacture of most octane aviation gasoline. It is of a higher purity than sludge acid, usually contaming 85%—50% HaSO4 and is frequently reused in the petroleum refinery.

Like other chemicals, sulphuric acid is graded by standards stupulated by the appropriate scentific societies or industries. The technical grade is usually intended for large scale industrial use and need not be of high purity. The U.S.F. label designates acid which meets the specifications of the United States Pharmacopoca while C.F., chemically pure, refers to acid of a higher grade usually prepared by distillation of a commercial grade acid. The purest grades, suitable for analytical and research purposes, are designated as regent, analyzed, etc.

Materials of Construction.—Of the common metals, only lead is satisfactorily resistant to cold sulphuric acid of nearly all concentrations up to rooys and to hot acid of concentrations up to about 70%. Generally the metals are less resistant to the hot and the more concentrated exicls, but steet and cast rron are exceptional in that they are resistant to cold acid of concentrations above approximately 78% because of the formation of a protective scale and are attacked with increasing vigor as the concentration decreases. Cast iron is more resistant than mild steet

to acid of most concentrations and has a satisfactory life even with very hot acid, provided its concentration is above oo%. However, cast iron should never be used as a container for oleum or for sulphur trioxide gases for it may crack with explosive violence when in contact with sulphur trioxide Mild steel should not be used at temperatures in excess of approximately 49° C (120° F) regardless of the concentration of the acid but it has a satisfactory life for acid of concentrations above 20% oleum even though hot Cast steel, malleable iron and many resistant alloys are available for specific concentrations, temperatures and applications, in some instances acid-resistant brick linings are used, eg, for hot oleum below 20%

The US Interstate Commerce commission issued regulations in 1946 permitting the use of rubber-lined metal containers for acid of not over 42° Be (about 50%). Lead-lined containers may be used for acid up to and including 93 2% Steel tank cars and tank trucks may be used for acid of not less than 52° Be (about 65%), but steel drums or barrels which are made of thinner metal may not be used for acid below 60° Be (about 78%) and even then only if the acid has no greater corrosive effect than 93% acid at 37 7° C. (100° F)

Moisture should be carefully excluded from iron or steel containers as the dilution of the acid at any point causes rapid corrosion. Sparks or open flames must be kept away from any closed vessel which should not be opened unless it is previously washed and the residual acid neutralized The vapour space over the acid may contain explosive hydrogen and poisonous arsenic, nitrogen or sulphur compounds.

Manufacture.- The date of the discovery of sulphuric acid is lost in antiquity, it was originally prepared probably by Arabian chemists in the 8th century and was apparently well known to the alchemists Near the end of the 15th century Basil Valentine described a method of preparation in which the acid was distilled from a mixture of green vitriol (FeSO4.7H2O) and silica and another method whereby the acid was obtained by burning sulphur with saltpetre (NaNOz). The older of the two commercial methods, the lead chamber process, was introduced in England in 1746 although the principles of the process had been used much earlier It was first manufactured on a commercial scale from weathered pyritic shales in Bohemia and at Nordhausen in Ger-

The first step in the manufacture of sulphuric acid is to prepare sulphur dioxide (SO2) gas by burning sulphur or sulphur-bearing materials such as iron pyrites, copper and zinc ores, spent oxide from gas plants and coke ovens, hydrogen sulphide from natural gas and petroleum refinery gas. It is also obtained by decomposition of various sulphates gypsum (CaSO<sub>4.2</sub>H<sub>2</sub>O), anhydrite (CaSO<sub>4</sub>), ferrous sulphate (FeSO<sub>4</sub>) from waste pickling liquors, sludge acid and spent acid The raw material used by a particular plant is determined by a number of considerations of great complexity which may include the location, the kind of process employed, the grade and concentration of acid to be produced and the cost. In the U.S. about 75% of the reported production of new acid at mid-20th century came from sulphur, 15% from pyrites, pyrrhotite and coal brasses, 9% from copper and zinc smelters and 1% from hydrogen sulphide In the U.K. approximately 40% of the production came from sulphur, 28% from pyrites, 20% from spent oxide, 12% from zinc blend and minor quantities from anhydrite and hydrogen sulphide

The next step in the production of the acid is to oxidize the SO2 to SO3. This is done by two different processes both employing catalysts. The lead chamber process yields acid of a concentration not more than 78%, and unless a pure raw material, e.g., sulphur, is used, the product is impure. The newer contact process was developed on a commercial scale during the last decade of the 19th century and is used to produce acid of any desired concentration and of high purity regardless of the quality of the raw ma-

Because of the increasing demand for acid of high concentration and purity, the latter process has steadily gained and by mid-20th century about 80% of the acid produced in the U.S. and more than one-half of that produced in the U.K. were manufactured

by the contact process. The two methods, however, remained competitive under certain circumstances

Contact Process -- Contact plants are of two main types. The newer and simpler type, often known as a raw gas or hot gas purification unit, was developed especially for use with vanadium pentoxide (V2O3) or other catalysts immune to impurities in the gas stream, and with sulphur as the raw material The other kind, known as the cold gas purification or simply the purification type, is used when the SO2 gas contains dust and other impurities from the ores which constitute the raw material.

Sulphur Burning Contact Plants .- In these plants the sulphur is melted to remove moisture and to permit the major portion of the dust or ash which may be present to settle. The molten sulphur with or without subsequent filtration is pumped to the burner Combustion air, 1e, air which has been dried by concentrated sulphuric acid, is supplied to the burner by a blower operating under a pressure between 1.5 lb, and 3.5 lb per square inch greater than that of the atmosphere thus preventing the infiltration of moist air into the plant. The SO2-air mixture containing 8%-11% of SO2 leaves the sulphur burner at temperatures which range from about 760° C to 1,200° C. (1,400° F. to 2,200° F) the temperature being proportional to the percentage of SO2 in the gases and to the amount of heat in the combustion air. Except in very small plants the gas is usually cooled by means of a waste heat boiler to approximately 400° C. (750° F ), and in some instances is passed through a hot gas filter to remove any remaining dust or ash before it comes in contact with the catalyst.

The catalyst is placed in layers on shelves or packed in vertical tubes in an insulated steel tank or tower called a converter. The reaction, 2SO2+O2=2SO3+45 k cal takes place at an almost imperceptible rate without a catalyst. However, the rate is greatly increased by the surface catalysts, vanadium pentoxide and finely divided platinum and further accelerated at elevated temperatures Practically all substances have some degree of catalytic action at high temperatures but the two mentioned are the most effective and, because of its immunity to impurities, the use of vanadium pentoxide after 1925 gradually replaced that of platinum in nearly all plants The fraction of the SO<sub>2</sub> converted to SO<sub>3</sub> decreases at excessively high temperatures. The temperatures at which the catalysts function effectively to give quickly the maximum yield of SO<sub>3</sub> are above about 400° C (750° F.) for vanadium pentoxide and 360° C (680° F.) for platinum To prevent excessively high temperatures from the exothermic reaction, which would diminish the yield of SO3, the conversion is carried out in stages with removal of part of the heat of reaction by waste heat boilers or other means between the stages The gas leaves the final layer of catalyst usually at temperatures between 438° C (820° F ) and 460° C. (860° F). In the development of the many types of converter with various arrangements and amounts of catalyst a high efficiency has been achieved whereby 95% to more than 98% of the SO, is converted to SOs.

The SO3 gas from the converter is cooled and passed into the absorption system where it is absorbed in 98%-99% sulphuric acid. It combines with the free water in the acid solution to form more H2SO4 thus increasing the concentration to any desired value up to 100% or to higher than 40% oleum. The SO2 is more readily absorbed by concentrated sulphuric acid than by water, for with the latter fog particles consisting of minute drops of HoSO, are formed and can be recovered only with great difficulty and expense. Lower concentrations of the acid may be prepared by dilution of the 99%-98% acid with water. The contact process may also be used to fortify spent acid or the more dilute acid produced in a chamber plant.

Sulphur-burning contact plants with capacities in single units

up to 600 tons per 24 hours and requiring only one operator have been built. Considerably more than a ton of high pressure, saturated or superheated steam may be generated for every ton of 100% acid produced. The required electric power is usually less than 35 kw per ton of 100% acid and the cooling water about 4,000 U.S. gallons per ton of acid. No buildings are needed for the housing of equipment.

Purification Type Contact Plants .- For the production of SO2

furnaces or roasters are available. It is desirable to select a roaster which will remove the maximum quantity of sulphur from the raw materials with a minimum carry-over of dust into the effluent gas and will produce gas with a maximum SO2 concentration at minimum operating and repair costs. It is also desirable to avoid the oxidation of SO2 to SO3 in the burner and the consequent formation of the acid mist. The concentration and purity of the SO, gas from the furnace determines the size, quantity and cost of subsequent gas purification equipment.

The gas usually leaves the roaster at temperatures between 650° C (1,200° F) and 1,100° C (about 2,000° F) and may be cooled by bare steel or cast iron pipe or by waste heat boilers It is important to remove the dust at this stage to prevent its deposit in subsequent equipment This is done by various methods about 80%-90% may be removed in cyclone centrifugal collectors and 90%-99% of the remaining dust in electrical precipitators which operate at 50,000 v to 70,000 v and at 150° C .- 430° C (about 300° F-800° F.). Precipitators have the advantage of low pressure drop, low power consumption and of recovery of dust in dry form but at the disadvantage of relatively high cost This equipment may be built of steel or of steel lined with firebrick, as the gas is normally so hot that no corrosive acid can condense. Some plants have replaced precipitators with proprietary gas washers which have as high or higher efficiencies in removal of dust and have the additional advantages of removing a large portion of other impurities such as metallic fume, arsenic and acid mist while simultaneously cooling the gas They have the disadvantage of relatively high pressure drop, as do cyclone dust collectors They necessitate recovery of dust in the wet condition but in many cases this is considered an advantage. Smaller and older plants occasionally use dust-settling chambers or scrubbing towers of various types instead of precipitators or gas washers.

After removal of the dust the gas must be cooled to permit removal of other impurities such as metallic fume, acid mist and fluorine, chlorine or arsenic compounds. They must be removed to the point where they do not clog or damage subsequent equipment and do not adversely affect the quality of the product acid for the purpose for which it is to be used. Such purification is necessary regardless of the type of catalyst used but the purification equipment need not be quite so carefully designed and operated when using a catalyst like vanadium pentoxide which is immune to all common impurities except fluorine compounds Cooling of the gas is necessary not only to remove impurities but also to condense and thus remove part of the water vapour in the gases If all of the water vapour were allowed to remain in the gas, it would cause the product acid in many cases to be more dilute than desired

After cooling and removal of impurities, the SO2 gas is dried with concentrated sulphuric acid Equipment after the drying tower is much the same as in sulphur-burning plants with the single exception that waste heat boilers cannot be employed to recover the heat evolved in the converter. As a result of its purification, the gas in this process is cold, instead of hot as in sulphurburning plants, and must be heated to the temperature at which the catalyst begins to function. The heat evolved in the converter is utilized for this heating by passing the hot SO2 gas and the cold SO2 gas through a series of insulated tubular heat exchangers built of steel. The SO2 gas is thus heated and the SO3 gas cooled

Contact plants of this type have been built with a single purification line capable of producing 300 tons of 100% acid per 24 hours and serving two 300-ton conversion and absorption lines. The labour, cooling water, power and maintenance requirements are much higher than in sulphur burning plants because of the additional roasting and purification equipment. However, in many cases the SO<sub>2</sub> gas is obtained at little or no cost from copper and zinc smelters or from other low-cost raw materials and the cost of the product acid may be substantially less than that from sulphur burning plants.

· The Lead Chamber Process .- This process derives its name from the use of large chambers of sheet lead and differs radically from the contact process, particularly in its use of gaseous oxides of

from low grade sulphur-bearing materials a large variety of nitrogen whose function may be considered to be catalytic. The chemical reactions which occur in the lead chamber process are more complex than those in the contact process, and there is not unanimity of opinion as to their mechanisms. It is thought that the catalyst reacts with SO2 gas, oxygen and water vapour to form the intermediate compound, nitrososulphuric acid (ONHSO4) which in turn reacts with water to form sulphuric acid and the oxides of nitrogen (NO and NO2) Thus the catalyst goes through repeated cycles, combining with the SO2, O2 and H2O to form the intermediate compound and being set free again with the simultaneous formation of H2SO4

The SO2 gas is generally produced in the same manner as in the contact process. However, if it is impure, se, obtained by the roasting of ores or by the burning of spent oxide, the purification is carried out only to the extent where the dust and other impurities are not present in quantities sufficient to clog the equipment This less efficient purification obviates the necessity of cooling the gas which is needed in the next stage of the process at a high temperature, preferably in excess of approximately 600° C (1,100° F.) and is necessarily at the expense of the quality of the product acid

After the hot sulphur dioxide-air mixture has undergone the necessary purification, it is passed in succession upward through the Glover tower, through the lead chambers and upward through the Gay-Lussac towers, nearly all of the SO2 being removed in the first two steps The Glover tower is a large masonry structure in some instances sheathed outside with lead It is packed with lumps of loose quartz, acid resisting brick or ceramic shapes so that the hot gases are brought into intimate contact with acid which trickles

downward through the packing,

The Glover tower has two main functions: (1) to concentrate the approximately 65% acid made in the chambers to 78% acid, the water vapour thus released entering the chambers with the gas stream; (2) to remove the nitrogen oxides from the 78% acid, nitrous vitriol (which has been used in the Gay-Lussac tower to absorb these oxides released at the end of the process and to return them to the cycle). The denitrification is accomplished by dilution of the 78% nitrous vitriol with the less concentrated chamber acid and by the elevation of the temperature of the mixture by the entering hot gases. The gases also begin to react and a substantial amount of sulphuric acid is formed in the Glover tower The 78% acid drawn off at this point is hot and contains only traces of the oxides of nitrogen After cooling, part of it is transferred to the Gay-Lussac towers where it is used to absorb the oxides of nitrogen released from the chambers The balance of it represents the production of the plant and is delivered to steel storage tanks

The cooled gases leaving the Glover tower proceed to the rectangular boxlike lead chambers which may vary in size from 5,000 to 500,000 cu ft, and in number from 1 to 20 The large chambers afford sufficient space and time for the gases which do not mix rapidly to react completely. The additional water necessary for the reactions is supplied through atomizing nozzles in the tops of the chambers. The sulphuric acid forms as a rain, drops to the bottom of the chambers and is pumped to the Glover tower. A large amount of heat is evolved by the reactions and is dissipated by the natural circulation of air around the chambers which are set well above the ground. The chambers are usually housed in a building to lessen the effect of varying atmospheric conditions on the operation As the gases pass through the Glover tower and the chambers, their SO2 content gradually decreases to 0.1% or less, this amount being desirable for the optimum recovery of the nitrogen oxides in the Gav-Lussac towers

The Gay-Lussac towers, usually two arranged in series, are similar in construction to the Glover tower but are tailer and of smaller diameter. They have thinner walls and linings because they receive relatively cool gases. Their only function is to recover the nitrogen oxides in the spent gases and for this purpose cool 78% acid is used The recovery is incomplete, and usually 10%-15% of the oxides are lost, constituting an appreciable item of expense. Hence, fresh oxides of nitrogen must be constantly supplied to the process. In some plants the fresh nitrogen oxides are made

from sodium nitrate and 78% sulphuric acid which is heated in an iron pot either by the hot SO, burner gases or by fuel. This method is obsolete at most plants and "nitre pots" were superseded by ammonia oxidation units Such units produce oxides of nitrogen by catalytic action of an incandescent platinum alloy gauge on a mixture of air and ammonia (about 9%) The oxides of nitrogen are then introduced into the process usually at the Glover tower inlet or outlet The gases may be propelled through the chamber plant by the natural draft created by the final Gav-Lussac tower and its exit stack but usually one or more lead or alloy fans are employed. Such a fan may be located between the Glover tower and the first chamber, after the last chamber or at both points

Because of the considerable lead and space requirements of the chambers, the lack of efficient cooling and the necessity for a large building, many variations of the process are in existence in which the boxlike chambers have been superseded by towers or by chambers of other shapes designed to promote more intensive gas mixing Some are water cooled externally while some depend on cooling by the internal circulation of large quantities of acid. The principal successor in the U.S. is the Mills-Packard water-cooled chamber constructed in the shape of the frustum of a cone, and first developed in England in 1914 By this means the chamber space required was reduced from 6 cu ft to o cu ft per pound of sulphur burned, in the case of air-cooled box chambers, to 2 o cu ft to 3 5 cu ft No building is required for the Mills-Packard chambers In the U K the Gaillard-Parrish chamber, another type, replaced the box chamber in some instances It is relatively tall but cylindrical in shape and is cooled by spraying 65% acid through the closed top by means of a horizontal, rotating disc called a disperser. The Gaillard disperser has also been used in the tops of box chambers to increase their acid-making capacity. Various processes have also been evolved in which a series of packed towers take the place of the box chambers and in which the oxidation of SO2 takes place largely in the liquid phase. Among these may be mentioned the Opl, the Kachkaroff-Guareschi and the Petersen processes, much used in Europe but not in America.

Concentration.-Concentration of sulphuric acid by evaporation of the water is practised intensively only at explosives and dye works or in petroleum refineries, where a dilute acid appears as a by-product which must be recovered and concentrated for reuse. A variety of types of equipment are used for this purpose, among which are the Cascade, Kessler, Gaillard, Pot, Simonson-Mantius and Chemico concentrators. They may be divided into three classes. (1) those like the Cascade process in which the acid is heated to its boiling point in acid-resisting basins by heat applied to the exterior of the vessel; (2) those like the Chemico drum concentrator in which the acid is brought into direct contact with a mixture of hot air and gases from the combustion of a fuel; and (3) those like the Simonson-Mantius concentrator in which the acid in a closed vessel under high vacuum is heated indirectly by steam. Concentrators in the first two classes operate at substantially atmospheric pressure and consequently the acid temperatures are high, especially where hot air in direct contact with the acid is used. The exit gases may contain appreciable quantities of acid mist which is recovered in coke-packed towers and electrical precipitators. Concentrators of the third class operate at relatively low temperature because of the high vacuum and create so little nuisance that precipitators are not required.

First Aid. The best first-aid measure for a sulphuric acid burn is "a lot of water quickly." Speed in removing the acid is of utmost importance, but small amounts of water must not be used because much heat is generated by dilution of the acid, and the burn is thus made more severe. Neutralizing agents and ointments are dangerous and should never be used until the burned area has been washed completely free of acid with water. After this has been done the burn may be treated in the same manner as a heat burn.

SULPICIA, the name of two Roman poetesses The earlier, daughter of Servius Sulpicius Rufus and mece of Messala, lived in the reign of Augustus Her verses, preserved with those of Tibullus and for long attributed to him, consist of six short elegiac poems (bk IV, 7-12 in the Corpus Tibullianum, 40 lines in all) addressed to a lover called Cerinthus (seldom now identified with the Cornutus mentioned by Tibullus in bk 11, 2 and 3) and are preceded by five elegiac poems (bk. iv. 2-6) by another poet who comments sympathetically on the love affair The latter poet may be Tibullus, but Esther Bréguet argues, from a detailed study of the language and metre, that the poet of 2-6 was the young Ovid, imitating the style of Tibulius,

The younger Sulpicia, wife of Calenus, lived during the reign of Domitian. Martial (x, 35 and 38) praises her wifely devotion, which was the subject of her poems. An extant satire (70 hexameters), discovered in 1493 and attributed to her, is probably of much later date

SULPICIUS RUFUS, PUBLIUS (c 124-88 B C), Roman orator and politician, supported the reforms of his friend the younger M Livius Drusus (of BC) and inherited his policy of generous concessions to the Italian allies. Though he renounced his patrician status to become a tribune of the plebs, he had shown, by prosecuting the tribune Gaius Norbanus in 94, that his political attitude was moderate. In the Social War he served as legate to Gnaeus Pompeius Strabo (89). As tribune in 88 he introduced several laws (1) to unseat all senators owing more than 2,000 denarii: (2) to recall all men exiled under the Varian law of 90 BC (a measure which he himself had opposed earliei); (3) to transfer the command against Mithradates from Sulla, the senate's nominee, to Marius, and (4) to distribute freedmen and the newly enfranchised Italians among the 35 tribes (so as to make their voting power effective). Sulpicius' chief aim was probably championship of the new Italian citizens, but to implement this he needed wide support, hence his other measures, which would secure for him the backing of the people, of Marius and the equites This bold challenge to the senate led to violence, and Sulpicius is said to have organized a group of 600 young equites and a larger bodyguard of 3,000 armed men The consuls, Sulla and Q. Pompeius Rufus, declared some form of cessation of public business (perhaps a justitium), which Sulpicius denounced as illegal. Disturbances followed in the Forum, and Sulla was forced to call off the justitium; he then joined his army in Campania At Rome Sulpicius' measures were carried. Sulla then marched on Rome and won the city. Marius and Sulpicius fled and were declared outlaws, and Sulpicius was caught and killed at Laurentum His laws were declared invalid, as passed "by force" Sulpicius' policy is obscure, but he may well have been a liberal optimate, whose championship of the Italians led his enemies to depict him as a revolutionary demagogue rather than as a moderate reformer forced by circumstances to go to greater lengths than he probably wished He was an outstanding orator of whom Cicero said (Brutus, 55) "He was by far the most dignified of all the orators I have heard. and, so to speak, the most tragic." Sulpicius published no speeches, those bearing his name being written by a P. Cannutius. He is one of the speakers in Cicero's De oratore,

SULPICIUS RUFUS, SERVIUS (c. 106-43 B.C.), surnamed Lemonia from the tribe to which he belonged, was a Roman orator and jurist.

He studied rhetoric with Cicero and accompanied him to Rhodes in 78 B C. Finding that he would never be able to rival his teacher he gave in the hetoric for law (Cicero Britus, 41).

In 63 he was a candidate for the consulship, but was defeated by L Lacinius Murena, whom he subsequently accused of bribery,

in 51 he was successful.

In the Crui War, after considerable hesitation, he threw in his lot with Caesar, who made him proconsul of Achaea in 46 He died in 43 while on a mission from the senate to Antony at Mutina.

He was accorded a public funeral, and a statue was erected to his memory in front of the Rostra

Two excellent specimens of Sulpicius' style were preserved in

Cicero (4d Fam, iv. 5 and 12).

Qunnthian (Instit, x, x, 116) speaks of three orations by Sulpicus as still in existence, one of these was the speech against Murena, another Pro or Contra Aufdium, of whom nothing is known. He is also said to have been a witter of erotic poem.

It was as a jurist, however, that Sulpicius was chiefly distinguished He left behind him a large number of treatises, and he is often quoted in the Digest, although direct extracts are not found (for titles see Teuffel-Schwabe, Hist of Roman Lit., 174, 4)

His chief characteristics were lucidity, an intimate acquaintance with the principles of civil and natural law and an unrivalled power of expression.

See R. Schneider, De Servio Sulpicio Rufo (Leipzig, 1834), O Karlowa, Romische Rechtigeschichte, vol i (Leipzig, 1885); the chief ancient authority is Cicero.

SULTAN (an Atabic word meaning "victorious" or "a ruler," sultat, dominion), a title of honour borne by a great variety of rulers of varying powers and importance in Mohammedan Africa and the east

The word has thus no exact equivalent m English, and was early imported into the language in the Middle English form of soudan (from the Old French soudan, souldan).

This title was conventionally applied by foreigners to the ruler of the Ottoman empire, the sultan par excellence, the proper styles being, however, padishah (emperor) and "commander of the faithful" (see AMIR).

The feminine form "sultana" was derived from the Italian (fem. of sultano)

SULTANPUR, a town and district in Uttar Pradesh, republic of India The town is on the Gumti river, midway between

Benares and Lucknow. Pop. (1951) 17,496.

SULTANPUR DISTRICT has an area of 1,699 sq mi; pop. (1951)

1.282.160 There are two other Sultanpurs in Punjab SUMACH or Sumac, the name given to numecous shrubs and small trees of the botanical genus Rhus (family Anacardia-cae), which comprises about 150 species, natives chiefly in warm regions. They have a milky or resmous junce, simple or compound leaves; small flowers, with the parts in fours or sixes; and small, dry, one-seeded, often harry, sometimes highly coloured

fruits, usually in dense clusters. The name sumach is given also to the commercial preparation of the dried and ground leaves of the Sicilian or tanners' sumach (R. coriaria) of southern Europe, long used in making leather. In North America the sumachs are represented by about 15 species. Several have poisonous foliage, as the poison sumach (R, vernix) and the poison ivy (q.v); the nonpoisonous sumachs include some of the most attractive American shrubs. Among those found in the eastern states and Canada are the handsome staghorn sumach (R. typhina), sometimes 30 ft. high, and the smaller smooth sumach (R. glabra), sometimes 20 ft high, both of which in autumn display highly coloured fruit and foliage. The dwarf or mountain sumach (R. copdlima) is a small shrub in the north and a tree 30 ft. high in the south. Its leaves, as also those of the two preceding, were formerly much used in tanning. The aromatic sumach (R. aromatica), 3 ft. to 8 ft. high, with pleasant-scented foliage, occurs in the eastern states; its western counterpart, the skunkbush (R. trilobata), with ill-scented foliage, is found from Illinois to Oregon and southward. The mahogany sumach (R. integrifolia), the laurel sumach (R. laurina) and the sugarbush

(R ovata) are elegant shrubs, native to southern California The lacquertree (R vermaifera) of Japan yields Japan lacquer The wax-tree (R succedanea), also of Japan, furnishes wax used candle-making. R. chinensis of eastern Asia and R. typhina var

dissecta, a North American form, are planted for their ornamental

SUMATRA, lying between \$° 39' N. and \$° 57' S, so that the equator divides it into two nearly equal parts, is the westernost and, after Borneo, the largest of the Great Sunda Islands of the Malay archipelago and forms part of Indonesa Its axis runs from southeast to northwest, from Sunda strat to Malacca passage, it is 1,110 mi in length, and its greatest width is 280 mi With its dependencies, Sumatra has an area of 180,380 sq mi (alone, 103,557 sq mi.) and is nearly four times as large as Java and almost as large as Soan

The economic development of Sumatra, though it is far behind that of Java, is much farther advanced than that of any other of the Indonesian islands

Physical Structure.-In relief, Sumatra consists of a high mountain chain which runs along the western coast, descending eastward to a huge tract of flat, alluvial land, seamed with many large rivers and their scores of tributaries Its great mountain chain is a link between the mountain system of Lower Burma, which is continued by way of Preparis and Great Coco Islands, the Andaman Islands and the Nicobars to Sumatra and thence to Java and on through the Lesser Sunda Islands to the Moluccas. The Sumatran chain extends for a distance of more than 1.000 mi. and contains numerous volcanic peaks of heights from 5,000 ft. to more than 12,000 ft The whole system, known as the Bukit Barisan ("Parade of Mountains"), consists in general of two or more folded chains running parallel to each other, with a valley between, which is broken up into separate sections by the intrusion of volcanic massifs. Along this valley lies a string of mountain lakes, from south to north-Ranau, Kerintii, Singkarak, Manindjau and Toba. By far the largest of these is Lake Toba, which is 45 mi. long and 15 mi. wide, with a depth of 450 m, and has a large island, Samosir

The line of volcanic peaks stretches across Sumatra from Abongabong (9,850 ft.) and the mountains of Achm to Krakatoa (q.v.) off the coast at the southern end of the island I includes Luser (17,000 ft.), Sinabung (6,040 ft.), Sibayuk (1,925 ft.), Pasaman (Mount Ophir, 9,844 ft.), Talang (8,521), Merpis (9,485 ft.), Singalang-Tandikats (9,446 ft.), Kerniqi ("the Peak of Indra-

pura," 12,484 ft.) and Dempo (10,365 ft.). In all, 90 volcanoes have been counted, 12 of them active

Sumatia, like Java and Borneo, is formed largely of strata of the Tertary period, although it contains also two schisces formations, one of which is anterior to the carboniferous period. The Tertary series are more complete than in Java, the volcances, so characteristic of the whole archipelago, are due to the Quaternary period. The western mountain system is composed largely of Archaean iocks, with occasional longitudinal bands of Jurissic and Creations or Kerney and eroson of the ranges exposes their mineral contents. The crystalline rocks of the properties of the work of the content of the properties of the proper

The river system of Sumatra is extensive and of great value to the country On the west coast, where the mountains approach the sea, the rivers run in valleys with a steep slope, have a very short lower course and are unnavigable, except near the mouth in the case of a few. The eastern rivers run through alluvial plans. have extensive drainage areas (they are often impeded by silt) and form the principal and often the only means of communication. South of 3° N, there are extremely important rivers, the first being the Asahan, which drains Lake Toba and is navigable by steamers for a portion of its length, next the Panai (Bila and Barumun), with a very wide mouth; then the Rokan, more than 120 mi, long and flowing into the Malacca straits through a wide. muddy estuary, navigable for 70 mi. inland, the Siak, with the port of Pakanbaru 100 mi, upstream, the Kampar, a very long river, navigable for ocean steamers for 18 mi, the Inderagiri, navigable for ocean steamers as far as Tjerinti; then the Hari, which springs from the peak of Indrapura, the largest of all the rivers of Sumatra, having a maximum navigability of just less than 500 mi., and then the Musi, on which ocean-going vessels can reach Palembang, 54 mi, upstream, while steam launches and motor boats can go 200 mi. inland and small boats 330 mi (below Palembang the Musi splits up into a number of channels which spread out amidst a vast unhealthy swamp and slowly denosit their mud among the mangroves, thus gradually creating new land)

On the coast, there are small semicircular bays, but few large indentations, immunity from the southwest monsoon being provided for harbours only between Tapanuli and Indrapura north coast has precipitous cliffs crowned with dense vegetation in some parts, in others sandy beaches and well-cultivated plains, while the bay of Oeleelheue gives shelter for shipping. The south coast consists, mainly, of two large indentations, Lampone bay and Semangka bay The eastern shore of Lampong bay is mountainous and little indented, the western is much cut up; the centre of the bay has a good harbour (Telukbetung). Semangka has a mountainous coastline, with little indentation. The whole of the east coast is formed of morasses and sandbanks, which break up into innumerable islands, large and small, particularly about the central portion; and the coastline is deeply indented in many places and very irregular. The indentations are not permanent, the coast is constantly advancing, and it is difficult to establish practicable ports or landing places

Sumatra has a chain of islands off the west coast which rise from the edge of the submarine platform and serve as a kind of outer barrier. They have an aggregate area of 5,769 sq.mi. Several are thickly populated, and some are of considerable size; most have rocky, reef-bound coasts, dangerous of approach.

Climate.—The climate of Sumatra resembles that of Java and is hot and extremely moist, but in most eastern costal districts and often for many miles inland the heat is tempered by cooling land and sea breezes, the wind generally being northeast by day and southwest by night all the year round. The wind system of northern Sumatra differs from that of the greater part of Indonesia, the northeast monsoon blowing from December to March, and the southwast monsoon from May to October. Durng the southwast monsoon strong squalls from the northwest, known as "Sumatras," which are accommanded by thunder, lightning and arin, blow in the

Malacca strait; they have been known also to occur during the northeast monsoon. On the west coast the influence of the northeast and southwest monsoons is felt as far south as 4° N Between 4° N and 2° N there is a region of calms and light variable winds, which have a westerly tendency from March to November, when the northwest monsoon is blowing along the remainder of the west coast (1 e, from 2° N to 5° 57' S), and an easterly tendency from May to September, the period of the southeast monsoon on the west coast. Southern Sumatra has the highest temperatures, and the mean annual temperature for the lowlands is about 80° F At Toba, in the Batak country (3,772 ft ), this is 69 6° F, and higher altitudes show a corresponding reduction. On the whole, temperature in Sumatra is slightly higher than in Java. March, April and May are the hottest months; January and February the coolest, but the difference does not exceed 2° The different wind distribution causes a variation of the seasons Thus in northern Sumatra October is the wettest month and February and March are the driest, while elsewhere the wettest months are December, January and February, and from July to September is the dry period. Accordingly the rainfall varies considerably. The annual average rainfall for northern Sumatra is 05.71 in, for eastern Sumatra 106 27 in., and for western Sumatra 122 32 in. The west monsoon gives the heavier rainfall and the fall is accentuated in western Sumatra by the high mountains.

Flora.-The flora of Sumatra bears a strong resemblance to that of India and of the Malay peninsula in the northern part of the island and to that of Java in the southern, but it has also many varieties distinct from either, and not only different varieties, but different genera from those of Java. The pine. Pinus merkusu, in the mountains of the north is not found elsewhere in the East Indies but occurs as far south as the equator One of the most striking flowers is the huge Rafflesia hasseltii, with blossoms 18 in. across, growing on big lianas on the ground in the forests There are immense areas of savanna country, covered with coarse grasses which stifle other forms of vegetation and give shelter to hordes of wild animals These tracts occur as low as within 700 ft of sea level Myrtles, bamboo, rhododendrons, moss-loving orchids and palms are common, and orders strongly represented are Dipterocarpaceae, Begoniaceae, Nepenthaceae, Oxalidaceae, Melastomaceae, Myristicaceae, Connaraceae, Gesneriaceae and Ternstroemiaceae There are zones of vegetation differing with altitude, but the general tendency is for all forms to grow at a lower level than is the case in Java. The Sumatran forest begins at a height of from 300 to 400 ft, and extends to all but the highest mountain peaks, giving a wealth of vegetation that produces very beautiful mountain scenery The forests contain the finest timber-producing woods in the archipelago, there is not only a great variety of trees, but they possess both stature and beauty. Deciduous trees such as the oak, chestnut, etc., grow on lower slopes than in Java, and apart from ebony, ironwood, camphorwood and sandalwood there

are also many species of resin and wild rubber-producing trees. Fauna.—Notwithstanding like proximity of the island to Java the fauna of Sumatra shows a greater resemblance to that of Bornee than to that of Java, this being particularly noticeable as regards the fauna of the east coast of Sumatra (that of the west coast and of the siands adjacent is more allied to the Javanese fauna). This striking difference in species between the fauna of Sumatra and Java led A. R. Wallace to assert that the first severance of Sumatra from Java is very ancient; that since the epoch of the first (volcance) disturbance several distinct elevations and depressions may have taken place, the islands having perhaps been more than once jounde with each other or with the manifor (of Asia) and again separated; and that successive waves of immigration may thus have modified the fauna and led to those anomalies in distribution which are so difficult to account for by any single operation of elevation or submergence.

The orangutan, common to Sumatra (in the northeast) and Borneo, is unknown in Java, the sananag (Hybobates syndactylate) is found in Sumatra and in the Malay peninsula but not in Borneo or Java, there are ape species common to Borneo and Sumatra, also the elephant (introduced into Borneo), tapir (indigenous also in the Malay peninsula) and Malayan bear, all of which are un-

known in Java, though, on the other hand, Sumatra shares the tiger with Java, while it is unknown in Borneo. The one-horned thinoceros of Java is known also in Sumatra, which shares a two-homed variety with Borneo. The Sumatra fluum also includes among primates the glibbon Hybotas lar, the bandel leaf monkey (Presbyts: mediolophias) and the pug-tailed macaque (Macaca nemastrina), both common to Borneo also, the silvered leaf monkey (P cristatus) and crab-eating macaque (M trus) common to Borneo and Java, the slow lors (Nytictebus), the tree shrews Thypia glis (in Borneo and Java) and T minor (in Borneo only), and the flying lemur, flying fox, bats, flying squrrels, ratis and mice; the simbar (Carvus simcolar) and the serow (Capricornis simuntarensis), wild dog; wild boar, and cevet cat.

There is no genus of birds peculiar to Sumatra but there are a few species and many subspecies The avifauna is very similar to that of the Malay peninsula, in the extreme south a few Javanese forms are found Among birds found in Sumatra but not in Java are the great Argus pheasant, the fire-back and other pheasants, and various partridges, the little Malay parrot (Psittinus cyanurus), the helmeted hornbill (Rhinoplay vigil), and the redbreasted bee-eater (Nyctiorus amicta) Other Sumatran biids include woodpeckers, pigeons and trogons Insects, which also show a marked difference from those of Java, comprise the beautiful Papilio memnon butterfly, the Papilio coon, and other species of this section, the Kallima paralekta (which attaches itself to and is able to imitate the leaf of a certain plant so closely as to secure itself from the attacks of enemies), flocks of Cyrestis, Melantis suradeva, a new species of Amnosia, Eurhima fulva, one of the prettiest species of Oecophoridae, two specimens of the curious genus Homopsyche, and the moth Pentacitrotus transversa Lizards, large and small, frogs, tortoises and turtles abound, crocodiles frequent the mouths of rivers and are also found upstream. there are many varieties of poisonous snakes, the rocks around the coast yield many kinds of shellfish and the sea, ponds and rivers numerous sorts of edible fishes (E. E L., X)

History.—Some authorities suggest that Sumatra, not Ceylon, may have been the Taprobane of Pliny By the end of the yth century the descendants of immigrants from India had made Palembang the seat of the powerful Hindu kingdom of Sri Vijaya. In the 13th century the Arabs invaded Achin and Mohammedanism took firm hold of some of the most important states. On ancient inscriptions discovered in the Padang highlands, the island was called "the first Java", Marco Polo called it "Java Minor"

It became known to Europeans as Sumatra through Ludovico di Varthema, an Italian, in 1505. The Portuguese established a trading post about 1509 and were driven out by the Dutch at the end of the century For the next three centuries the Dutch were engaged in costly efforts to establish supremacy in Achin (Atjeh); a 30 years' war, started in 1873, is estimated to have cost 250,000 lives and £50,000,000 sterling In 1602, the English first visited Achin, when Sir John Lancaster was well received, and 11 years later, to the annoyance of Dutch and Portuguese, they were given permission to start a factory The Dutch established their sover-eignty over Indrapura in 1664 and over Padang in 1666. In Palembang, where the Dutch had secured a modest concession in 1620, the sultans repeatedly sought to throw off the yoke: twice-in 1654 and 1819-the Dutch were actually driven out; and not till after a serious revolt in 1851 had been suppressed was their tenure secure. In Diambi the efforts of the sultans to escape the consequences of concessions were equally persistent. Throughout the 18th century Dutch and British maintained a constant rivalry in Sumatran waters Bengkulen, where the English acquired a footing in 1685, was among the sources of irritation to the Dutch and was handed over to them in 1824 in exchange for Malacca In Deli, in Menangkabau—whose princes claimed descent from Sultan Iskander (Alexander the Great)-and elsewhere, the Dutch established their authority in the teeth of repeated insurgence and generally as the result of the quarrels of native rulers who invoked their help and had to pay the price.

Except for certain regions of the interior (including almost the whole of Achin), Sumatra was occupied by the Japanese in World War II. After the defeat of Japan, the Dutch tried to re-establish

themselves, but left Achm alone Eventually the whole island was merged in the new state of Indonesia (q v), but the central government's control of vast parts of the interior was for some time only nominal the Achmese, the Batak and the Menangkabaus all demanded autonomy, the Achinese going so far as x to support their claims by armed revolt (x). H. x E x X is

Population —The population of Sumatra, which was returned as numbering 384,17,5 at the census of 1330 (when it included 26,354 Europeans and Eurasians and 280,592 foreign Assistes, anally Chinese), was estimated at the middle of the 20th century to have risen to 12,000,000. The Indonesian government in the 1905s sponsored the immigration of large numbers of people from Java (10,000 families to South Sumatra and 3,200 to the Djambi area of Central Sumatra in 1954).

The whole of the indigenous population had, probably, a common Malayo-Polynesian origin, but today all the races may be classified as Malay, in a wide sense, the pre-Malay blood of the country having been absorbed thoroughly. There is no race of true Negrito tyne.

Of these Malayan divisions the Achinese (qv) inhabit the ancient kingdom of Achin in the northwestern promontory and the whole of the north of the Gayo country

Gayos —The Gayos live in the northern central portion of the country, between the Achinese and the Batak, with the Alas on their west, living mainly in the valley of the Simpangkiri They are essentially a highland and insular race and form an ethnographical unit, all speaking one language. Alan to the Batak, they are agricultural and pastoral, a friendly and honest race, living in well-built houses of wood, in small scattered villages. Their chief crop is nec, maize, cotton and sugar cane are grown; horses and cattle are reared; and forest products are collected (there is an antimate substituting), between the contractions of the contraction of the co

Batak Groups -The Batak inhabit the mountainous region about Lake Toba and a part of the east coast. They are divided into several groups, differing considerably in language and customs Of Malay-Polynesian origin, the Batak are nearly one-third Mohammedan, more than one-third are Christian; the rest animist. Cannibalism (which was largely punitive and ritualistic) and slavery have disappeared The Batak possess a written language of their own; build compact houses on piles, with horned roofs, many families inhabiting one house; and have rice barns and a communal hall. The houses are beautifully decorated, the Batak being clever craftsmen in wood, Ivory and copper (they also understand iron smelting) The Batak are good agriculturists (rice cultivation, wet and dry, being their chief occupation, though maize, coffee, fruit and vegetables are grown) and real horses, cattle, buf-faloes and pigs They weave and dye cotton garments, make their own jewellery and pottery and can become keen traders and shopkeepers, teachers and even doctors.

Society is patriarchal, marriage exogamic, women are in a subordinate position, and polygamy is practised. There are village councils, a nobility, land belongs to a family, or village, but tenure differs.

Mesnanghebaus — South of the Batak, mt he Padang hughlands and vicmity are the Menangkabaus. At one time their ancient and powerful kingdom (which legend says, rose on the ruins of a Hindu empire) covered the greater part of Central Sumatra. They sent out emigrants to the Malay peninsula and represented the highest form of Malayan civilization.

Although converted to Islam, the Menangkabaus retained their ancient custom of the matriachate (i.e., descent and inheritance in the female line), which is said to be preserved nowhere in a puere form than among them: a wife remains after marriage with her kinsfolk on the mother's side, and the husband, having no home of his own, only visits his wife and resides in his mother's house; names, privileges and property derive from the mother's side; the cledest man of the elder female line is termed momak and is the keeper of all the possessions of the family Land is unalicable and always comes back into the possession of the family or village. Marriage between members of the same tribe is not allowed Houses, raised from the ground, are very ornate, with horned ridge poles and finely carved wooden fronts, sometimes painted Several families bearing the same patronymic live in the same house, and several houses, their rice bains, a communal house, a mosque, school, an inn and market form a village. There are priests and nobles, the people live by trade, agriculture, hunting and fishing. Their language is one of the chief branches of Malay (with a few words of Sanskrit origin), the Javanese script was once used but has been superseded by the Arabic

Other Peoples -South of the Menangkabaus, in the Indrapura region, live the Kerintjis, a small community, partly Mohammedan, partly animist; and east of these in Diambi, Malays using the term as denoting a seafaring race (Mohammedans), speaking Malay and having the usual Malay characteristics, not fond of work, prone to finery, devoted to sport and gaming, friendly and

intelligent and living in tribes
In the Redjang-Lebong area there are the Redjangs, a rather truculent people, who work in the gold and silver mines of their country, are Mohammedans, possess a script of Indian origin and

have Hindu antiquities scattered among them

In the south are the Lampongs, who were largely under Hindu influence and attained a high degree of civilization which they have retained Pepper culture is the chief occupation. Even before World War II. Javanese colonies were developed there Among the primitive tribes, there are the nomadic Kubus of the Diamoi mountains, almost dwarfs, with frizzled hair denoting Negritic blood All are extremely shy and isolated peoples, but quite peaceable, nomadic or seminomadic, primitively clothed, living by fishing and hunting and rude agriculture. (For "Island peoples" see NIAS; MENTAWEI, BATU ) Enggano people are animistic Malays, fishers and agriculturists. (E E L : X )

Provinces and Towns.-Sumatra is divided administratively into three provinces, North Sumatra, Central Sumatra and South At the head of each province is a governor, who is nominated by the Indonesian ministry of home affairs. The governor is assisted by a provincial council, one of whose functions

is to advise him on matters of local concern

The capital of North Sumatra is Medan, which is moreover the largest city of the whole island It is served by the port of Belawan Deli (see Belawan), which stands about halfway along the east coast of the province. The northern part of North Sumatra consists of the former government of Achin (qv), the capital of which was Kutaradja, with Oeleëlheuë (at the northwestern extremity of the island) as its principal port and Lho Nga, another major town, a few miles to the south Along the west coast of North Sumatra stand Meulaboh, Tapatuan, Singkil, Barus, Sibolga (capital of the former residency of Tapanuli), Natal and, in the extreme south, Ajerbanggis Towns of the north coast, to the east of Oeleelheue, are Sigli, Meureudu, Bireuen and, on either side of the promontory of Diamond point, Lho Seumawe and Idi. Towns of the eastern coastal region are Langsa and Pangkalang Brandan, north of Medan and Belawan; and Tandjongbalai at the mouth of the Asahan and the fishing port of Bagan Siapiapi on the estuary of the Rokan. The major towns of the interior of North Sumatra are Takingeun, Kotatjane, Blangkeredjen, Rantauprapat and Padang Sidimpuan Simuloee, Bandjak, Nias and the Batu Islands are included in the province

The capital of Central Sumatra is Bukittinggi (formerly Fort de Kock), between the lakes of Manindjau and Singkarak, near the magnificent Buffalo canyon (with walls 200-300 ft. high) in the Padang highlands behind the great port of Padang (q v.) on the west coast. Also in the hinterland of Padang are Pajakumbuh (beyond Bukittinggi), Solok, Sawahlunto and Sidjungdjung; Padangpandjang stands between Padang and Bukittinggi. Towns on the west coast are Priaman (north of Padang), Painan, Balaisalasa and Indrapura (toward the southern border) wide lowlands between the Bukit Barisan and the east coast of Central Sumatra have few towns of importance other than Djambi, capital of a former residency (see James), in the far south; Rengat in the Inderagiri basin; and the inland port of Pakanbaru, 100 mi. up the river Siak. On the islands of the Malacca strait included

1 Jan

in the province, however, are Bengkalis and Tandjongpinang The Mentawer Islands (qv) off the west coast are also part of Central

The province of South Sumatra has its capital at Palembang on the Musi (see Palembang) Its other great ports are Bengkulen on the west coast and Telukbetung, capital of the former residency of the Lampongs (q v), on the Sunda strait in the south, there are also the smaller ports of Bintuhan and Kru south of Bengkulen Inland, Batuadia stands northwest of Telukhetung and southwest of Palembang, and Lahat hes at the foot of the mountains, on the opposite side from Bengkulen The islands of Bangka and Billiton (Belitung) are included in this province

Communications -In North Sumatra there is railway connection between Kutaradia and Belawan Deli via Medan, this line branches into the hinterland of Medan and is continued southeastward from Medan to Rantauprapat, with a westerly branch to Padang Siantar and an easterly one to Tandjongbalar In Central Sumatra, Padang is connected by rail on the one hand with Sungailimau (via Priaman) and on the other with Padangpandjang, whence lines run via Bukittinggi to Pajakumbuh and via Solok to the mining area of Sawahlunto. In South Surnatra the railway from Palembang has two lines, one running southward via Baturadja to Tekukhetung, the other westward to Muaraenim and thence northward to Lubuklinggau Communications from east to west across the Bukit Barisan are of necessity by road. The importance of rivers as a means of communication, particularly for Central and for South Sumatra, has already been ex-

Internal air communications were in process of development by the middle of the 20th century, when airports had been established at Medan, at Pakanbaru, at Tandjongpinang, at Rengat, at Palem-

bang, at Branti, at Bengkulen and at Sibolga

Agriculture .- Volcanic effusion has enriched the soil over large areas of the island, and irrigation, sponsored by the government, brings water with a high mineral content to the less fortunate regions where its fertilizing properties are required. Agriculture in Sumatra is of two types indigenous, in the hands of smallholders; and European, on large estates.

The smallholders' main crop is rice, which is the staple food of the island and is grown entirely for home consumption. Even so, large quantities of rice have to be imported, as Sumatra's own crop is not sufficient to feed the population. Both wet (sawsh) and dry (ladang) methods of cultivation are practised. In the hope of increasing the yield, the Indonesian government established a pool of equipment whence smallholders could borrow tractors and other sorts of machinery. Maize is also grown by smallholders (by the Batak as a primary crop) for home consumption smallholders' crops are copra, spices (pepper, cloves and nutmegs), coffee, tobacco, betel nuts, groundnuts, coconuts, kapok, cotton and gambier. Ebony, sandalwood and ironwood are cut in the forests, which also yield wild rubber, rattan and resins

European agriculture on large estates is concerned principally with rubber, tobacco, tea, palm oil and hard fibres (sisal and ramie), and to a lesser extent with cinchona bark (for quinine). coffee, gambier and coca.

Rubber is grown in all three provinces of the island, but the greater part of the yield comes from the large estates: of Indonesia's 719 rubber estates, Sumatra has 242 These large estates. planted with Heven trees and concentrated predominantly in North Sumatra (between Lake Toba and the east coast) produced 183,-938 metric tons of rubber in 1952. The most important tobaccogrowing area is also in North Sumatra, around Medan and Belawan Deli (the leaf is fine and silky-looking and 18 particularly suitable for the outer wrapping of cigars). The output of tobacco amounted to 8,700 metric tons in 1952. The intensive cultivation of trees for palm oil, again mainly in North Sumatra, began in the 20th century; by the 1950s production in a normal year was about 240,-000 metric tons, but adverse circumstances might reduce it considerably (e.g., to 145,565 metric tons of palm oil, with 38,508 of palm kernels, in 1952). Tea is grown throughout the island, but again most extensively on the estates of North Sumatra; the crop suffered gravely from the onset of blister blight in 1949, which necessitated the widespread use of fungicides, the yield in 1952, amounting to 9,123 metric tons, was less than half of what it had been in 1939 Hard fibres constitute the remaining major product of the North Sumatran estates, because, however, of the difficulties arising from the long growth-cycle of the Agave plant (from 8 to 10 years), the cultivation of sisal was to some extent being superseded, in the rosos, by that of ramie, which the government encouraged, total production of hard fibres amounted to 20,230 metric tons in 1052 Most of the island's cinchona bark comes from the west coast of Central Sumatra (estate production 199 metric tons in Coffee is grown by smallholders in the Lampong area of South Sumatra and also along the west coast as far north as the Tananuli region Most of the island's pepper crop comes from the Lampong area (around Telukbetung) and from the neighbourhood of Palembang, lesser quantities from Achin (in these areas the average yield of a single plant is 0 3-0 8 kg. of black pepper), on the island of Bangka a more intensive method of cultivation is in use

The muor smallholders' crops are found mainly along the west coast of the sland, beted nuts in North Sumatra, copra and nutmeps in North and in Central Sumatra; resins in Central Sumatra; resons in Central Sumatra; and and in South Sumatra, and celtral sumatra coronts in Central and in South Sumatra, and celtral sumatra in the index property of the sum of the s

Fisheries.—The great fishing port of Sumatra is Bagan Siapiaji, which is the largest in Indonesia outside Jaw, by the 1950s it was handling an annual catch of about 80,000 tons. There are also fisheries at Sungsang (on the coast north of Palembang), at Lampong (near Telukbetung), at Bengkulen and on Bangka Island, Dried fish are exported, shellish, trepangs (see-slugs) and prawns (from which the delicacy known as kraipids is made) are also

caught
Minerals.—The major mineral resource of Sumatra proper is netroleum, found predominantly around Palembang and in the Diambi region but occurring also in North Sumatra, it is refined at Palembang, which exported 5,537,629 metric tons of petroleum and petroleum products in 1952 On the islands of Bangka, Billiton and Singkep, however, there are rich deposits of tin, which by the 1950s had made Indonesia the second largest tin producer in the world, output amounted to 30,613 long tons in 1948 and to 35,003 m 1952 (65% of this total coming from Bangka, where the mines are government controlled) Bauxite is mined on the islands of the Riouw archipelago opposite Singapore and on the mainland in the Asahan valley inland from Tandiongbalai. The principal coal fields are at Bukitasam (southwest of Muaraenim on the railway inland from Palembang) and on the Umbilin river near Sawahlunto (in the Padang highlands): by 1952 the average annual production of coal amounted to 600,000 tons from Bukitasam and to 78,000 from the Umbilin mines (the deposits of coal around Bengkulen were hardly exploited). Gold and silver occur on the west coast in the Redjang-Lebong area and at Simau. There are also deposits of lead, copper, iron, antimony, cobalt, naphtha, sulphur, alum and saltpetre in the mountains

Exports.—The accompanying table indicates the export trade of the principal port of each of the three provinces of Sumatra.

Exports, 1952

Loeb, Sumatra Its History and Peoples (Vienna, 1935). W Marsden, History of Sumatra, 3rd ed (London, 1811), is still interesting (X)

SUMBA (Dutch SOEMBA), also known as Sandalwood, one of the Lesser Sunda Islands, Indonesia, area 4,306 sq mi island is dominated by heights of from 2,200 to over 3,000 ft Several bays on the north coast give good anchorage, the best heing that of Waingapu. The rivers, mostly unnavigable, are of importance for agriculture. A fertile soil and a fairly good rainfall (average 63 7 in annually) help to produce good forests, grazing ground and food crops The forests yield sandalwood (giving rise to the old name for the island), dye-woods, wax and wild connamon On the grazing grounds are bred some of the finest horses in the country-the sandalwood breed-and fine cattle (Ongole), both of which figured largely as exports, while rice is raised on sawahs and ladangs, and maize, coffee, tobacco, coconuts, vegetables and fruit are grown, copra being exported The pop. (1930) was 182,354, consisting, apart from the indigenous Sumbanese, of péople from Flores, Savu and Rotti. The Sumbanese are a Malayo-Papuan people of good physique Except in the interior, where clothing is far more primitive, the sarong and banu are generally worn by women, and sometimes by men Both sexes are fond of ornaments They cultivate the soil, fish, mostly in rivers, not being a sea-loving race, collect forest products, edible birds' nests and turtles, make fishing-nets and plait baskets There are workers in copper and iron, while the women weave, spin and dye, and make pottery. The natives are largely pagan (there are some Mohammedans) and make offerings on stone altars. A particular breed of horses is held sacred

The Sumbanese enjoy feasts, music and dancing Traditional customs include marriage by dowry and polygamy, fairly common among the upper classes. There is no written form of the Sumbanese language, which is allied to that of Savu. Sumba has numerous megalithic monuments.

The sandalwood of Sumba attracted attention to the island in the 17th century, when Sumba appears to have been a tributary of the state of Bima, in Sumbawa Later Sumba became independent of Sumbawa, and treaties were concluded in 1756 with Dutch. Between 1856 and 1874, new treaties were made, but there were frequent difficulties with the natives, due to piracy and slave raids The trouble continued and in 1901 the Dutch were compelled to land troops. Most of the cheefs of the tribes were bound by the "short declaration," but there were disturbances in Sumba (Lamboja), necessitating a Dutch armed force in 1914

Japanese forces occupied the island during World War II
(E. E. L. X)

SUMBAWA (Dutch SORMBAWA), one of the Lesser Sunda Islands, Indonessa, between Lombok and Flores, and separated from the former by Alas strait and from the latter by Sapeh strait and the Island of Komodo Sumbaw with relighbouring islands, has an area of 5,695 sym. From 30 to roo mi north are the Fenga and Sabaliana (Paternoster) Islands, small low of each of the peninsulas. There are only a few stretches of alluval land along the coast: off the southern shore great depths of water are soon reached in the Indian occur. The mountains, some volcanic, are highest in the north. Mt. Tamboro, 9,255 ft. high, was very severely dramaged in the cruption of 1815. No other volcances appeared to be active in modern times. The average annal rainfall (Bilman) in 9,311.

Agriculture is carried on, nce being raised on sameats and adargs, while maize, cotton, coffee, tobacco, coconuts, onions and other vegetables, and fruit are grown. Horse and cattle breeding are important industries. The forests yield dye-woods (chiefly sapanwood) and teak.

The pop. (1930) of Sumbawa was 314,843 The natives of the western peninsula (Sumbawa) are of Malayan stock and allied to the Sassaks of Lombok, and those of the eastern peninsula (Bima, Sanggar and Dompo), are Malayo-Papuan.

Vessels of the Royal Packet Navigation company ordinarily called at Bima, Sumbawa, and Taliwang, affording communication with Macassar, the other Sunda Islands and Java ports. Sumbawa consisted originally of six states, all owing allegiance to either

Papikat and Sumbawa, after the eruption in Tamboia in 1815 that state and Papikat ceased to exist. In 1701 the Dutch arbitrated between Sumbawa and other states in the island engaged in civil war, and in 1765 the Dutch made a separate agreement with Sumbawa, revised in 1875 and again in 1905, under which it has a certain measure of self-government A contract made with Bima in 1857 and again in 1886, on the lines of that made with Sumbawa, was revised in 1905 It allowed the state some selfgoverning powers Sanggar was subject to the sultan of Ternate originally, then to the sultan of Macassar, and after the Bongay contract of 1667 it became a fief of the Dutch A treaty made in 1858, and revised in 1905, defined its right of self-government Dompo gave up allegiance to Macassar after the Bongay contract was a party to the Sumbawa treaty of 1765 with the Dutch, and had its self-governing powers fixed by subsequent treaties. Sumbawa was occupied by Japan during World War II

(E E. L : X)

SUMBUL or SUMBAL, also called Musk Root, a drug occasionally employed in European medical practice. It consists of the root of Ferula sumbul, Hook, a tall Umbelliferous plant found in the north of Bokhara, its range apparently extending beyond the Amur. The action and uses of the drug are the same as those of asafoetida (q v)

SUMERIAN LANGUAGE. The language now called Sumerian was revealed about the middle of the 19th century to Sir Hemy Rawlinson and other scholars when examining the baked clay tablets which had formed the library of Ashurbanipal, king of Assyria. These had recently been discovered by Layard in the ruins of Nineveh and brought to the British Museum When the cuneiform script in which they were written was deciphered, it was found that certain of them contained works composed in a language entirely different from the Semitic tongue of the Assyrians, but sometimes provided with interlinear translations into Assyrian; other tablets were dictionaries in which the words of this strange language were assigned their Assyrian equivalents

It was many years before the study of Sumerian was firmly established, although its meaning could be so confidently interpreted from the Assyrian translations. This was due both to the impossibility of discovering cognate languages, and to the factitious obstacle of a paradox which was subsequently maintained, chiefly by Joseph Halévy, that Sumerian was no true language at all, but a purely artificial system of secret writing invented for mystification of the vulgar by the Assyrian priests. The second of these hindrances was ultimately removed by the discovery of monuments inscribed in this language, which evidently belonged to a time before the Semitic tongue was written in Mesopotamia; the problem of finding a cognate language re-

Its Speakers and Script .- The area covered by this ancient speech was probably never very extensive. It is, at any rate, found only upon the monuments from the country lying between the Euphrates and Tigris, extending somewhat to the east of the latter, and from about the latitude of Baghdad to the head of the Persian gulf, which has receded since ancient times Its main centre was apparently the region of Nippur, the seat of the chief Sumerian cult. To the north, in the country later called Akkad, a Semitic language prevailed from very early times. Of the race or original home of the Sumerians nothing can be confidently asserted, for they appear settled in this territory from the earliest intelligence we have of them, and their own tradition of a fabulous antiquity gives no hint of another home. In this habitation they invented (for there is no evidence of borrowing) the pictorial script which became by a long process of evolution the cureiform signs, later adapted by the Semites for the writing of their own language. The year 3500 B.C. may be taken as a round date for the beginning of this script, the development of which can now be somewhat exactly observed, from definite pictures into the purely conventional groups of wedges with which it ended in about the last century before Christ. Very early the stage was reached at which signs were used not only to express the idea which they represented as pictures, but also for the mere

Gowa or Macassar in Celebes-Bima, Dompo, Sanggar, Tambora, sound of the corresponding word in a context which did not involve the actual idea at all, thus the sign ka is the picture of a mouth, but it is also used to write a certain grammatical ending -ka which has nothing to do with the idea of "mouth." The Sumerian writing, then, is a mixture of pictorial and phonetic elements, the roots being generally written with a sign which in itself expresses the required idea, accompanied by other signs used simply to supply the grammatical modifications. Two difficulties are caused by the polyphony of signs, and the existence of homonyms, one picture (e g the "foot") having been used to express two connected but different ideas (e.g the "foot" itself, and "to go"), two phonetic values, or more, became attached to the sign On the other hand the language possessed many words, of different meanings, which chanced to be of similar sound, (eg, the word sig was both "low" and "to strike"). In modern works these homonyms are usually distinguished by discritical marks. Certain of the signs are also used as determinatives, ie, they are placed before or after words to assign them to a particular class of natural things, such as man, bird, fish, wood and several more

Outline of Grammar .- The 100ts of the language are generally monosyllables though a few longer words are found. These roots are not subject to internal change, since grammatical distinctions are made by grouping a number of elements together around the root, not by causing the root to assume different forms. In the case of roots having the form consonant-vowelconsonant the final consonant is often dropped when a consonant mmediately follows. In itself the root expresses a base idea only; thus dug means "good," and can appear not only as an adjective but (with the appropriate modifying elements) as a noun "goodness," or a verb "to be good." Nouns are mostly formed by adding prefixes, sometimes the vowels a or u, but more often nam or mg which form abstracts; thus, from dug, the noun "goodness" would be nam-dug. Sumerian has no gender, which is disregarded in places where it is indifferent and expressed where necessary either by prefixing the determinatives for "male" and "female" or by the use of entirely different words, such as adda "father" and ama "mother." Plural of nouns is not always indicated, but can be formed when required either by repeating the root (kur "land," kur-kur-ra "lands"), or by the addition of suffixes -ene (used of persons), -mesh or hi-a. There is no special form of the dual, though the number two can be written if essential The relation in which the noun stands to the rest of the sentence is shown by a rather elaborate set of suffixes, which may be treated either as postpositions or case endings. Of these -a generally expresses the accusative, -e the nominative, -da is "with," -ta "from," -ra and -shu "to," -gim "like," while the genitive is denoted by a suffix -ak, which has the peculiarity of doubling itself to correspond with the number of genitives to be expressed, though this doubling is often concealed by the omission of a final consonant. Finally, the noun always stands at the head of a complex of modifying elements, with which it combines to form a kind of composite unity.

A peculiarity of the verbs is that, besides the simple roots, there are also compounds formed by the prefixing of a noun, the whole making one idea (e.g., de "to pour" and gu-de "to pour out a voice, to speak"). Between the nominal and the verbal part of the compound root are placed such of the accompanying elements as normally precede the root. These accompanying elements may be classified into three kinds (a) subject prefixes, (b) conjugating elements and (c) infixes. The first merely indicate the subject, not expressing in themselves either number or person, and the force of the individual prefixes is still insufficiently clear Distinction of tense, number, person, mood and voice is effected by the conjugating elements, but the resources of the language for these purposes are not highly developed, and it is clear that some of the grammatical tablets compiled by Semitic scribes for their own use lent to the Sumerian verb a number of artificial refinements which are not observed in the native texts Extensive use is made of participial constructions, and there is a special form for the optative, and a corresponding prohibitive particle The infixes, which convey the direct or indirect object, as well as certain adverbial relations, are included in the verbal

forms as the result of a strong tendency for the predicate to gather into itself parts representing all the other members of the sentence. The order of elements in the verb-complex follows a strict rule. The numeral system was sexagesimal and decimal.

The native grammarians knew of five different "tongues" in Sumenian. These are assumed to have been dualects, but in act nothing is known of them except the eme-sal "broad (?)-tongue," in which a number of religious texts are composed. This is differentiated from the ordinary form chiefly by a weak-ening of certain consonants, particularly of g into m, and by a preference for phonetic witing Sumerian ceased to be spoken before 1500 n C, but was long used as a learned language.

oelore 1500 BC, jutt was iong used as a isatmen ianguage.

SUMER IS ICUMEN IN ("Summer is come in,"), famous 13th century English round which occupies a unique place in the history of music as standing alone in respect of the advanced character of its writing, as well as of its musical beauty, among the compositions of its period. As Father Anselm Hughes has put the matter in Grove's Dictionary of Music, this astonishing composition is pre-eminent in six respects, for (1) it is the oldest known canon; (2) it is the oldest known harmonised music which is frequently performed and enjoyed by singers and listeners today; (3) it is the oldest known 6-part composition; (4) it is one of the oldest known specimens of the use of what is now the major mode; (5) it is the oldest known specimen of groundbass; (6) it is the oldest known manuscript in which both secular and sacred words are written to the music. The generally accepted belief is that it was composed somewhere about the year 1240, and it is ascribed to one John of Fornsete, who wrote the ms, which came from Reading Abbey. See article Music, section 3, where the music is reproduced.

SUMMANUS, properly an epithet (= "highest") of Jupiter (qv); afterwards god of the nocturnal heavens, thunderstorms at night being attributed to him, those by day to Jupiter. Sumanus had a temple at Rome near the Circus Maximus, dedicated at the time of the invasion of Italy by Pyrrhus, king of Epirus (278). Here searfice was offered every year to Summanus on June 20, together with cakes called summanulia baked in the form of a wheel

See G. Wissowa, Religion und Kultus der Römer, p. 122 (1912), W. W. Fowler, The Roman Festivals, p. 160 (1899).

SUMMARY JURISDICTION. (\*) Meaning: The phrase is now understood in English has as referring to jurisdiction, excised by justices of the peace, which may result in a summary conviction or order. Blackstone dwides the proceedings in courts of criminal jurisdiction into two kinds: summary and regular: and by regular he means such as involve trial by jury, the only mode of trial known to the Common law except in the case of contempt of court. In these regular proceedings there is only a preliminary hearing before justices, followed by either a dismissal or committal for trial by jury at Quarter Sessions or Assizes.

(a) History—Heing unknown to the Common law, this jurisdiction is entirely the creation of statutes. A brief sketch is to be found in Stephen's History of the Criminal Low, vol 1. ct. 4, of the growth of the criminal jurisdiction. Speaking generally this growth has shown itself in two distinct forms: (a) The concerning of exclusive jurisdiction in a vast number of minor offences, mainly involving the infliction of pecuniary penalties, under such headings as Army, Game, Highway, Licensing, Motor Cars, Marchant Shipping, Post Office, Public Health, Revenue and Vagrancy. These offences have been created and are being ordered to the control of 
In addition to summary criminal jurisdiction, justices have been endowed by many statutes with a summary civil jurisdiction of increasing scope and importance

(3) General Legislation.—A court of summary jurusduction is defined by the Interpretation Act 1889, as "Any justice or justices of the peace or other magistrate by whatever name called, to whom jurusduction is given by or who is authorised to act under the Summary Jurusduction Acts and whether acting under the S. J. Acts or any of them, or under any other Act or by virtue of his commission or under the Common Law." This does not apply to justices sitting as the licensing authority nor to the preliminary hearing by justices of inductable offences

In the Interpretation and the The Acts of the Interpretation and the Interpretation and the Interpretation and Interpretation a

(4) Constitution of the Courts.—A court consisting of not more than one pustice has a jurusdiction limited to received an information or complaint, issuing a summons or warrant (S1, Act 1848 s 1), adjourning the hearing to the next practicable sitting of a Petty Sessional Court, and where authorised by the statute creating the offence, trying the case and imposing a punishment of not more than 14 days imprisonment or a fine of not more than 2c/(S1, Act 1879 s 2c)

A Petty Sessional Court is defined by the Interpretation Act 1889, as "A court of summary jurisdiction consisting of two or more justices when sitting in a Petty Sessional Court, and shall include the Lord Mayor of the City of London and any Alderman of that city, and any metropolatan or borough police magistrate or other stipendiary magistrate, stuting in a court-house or place at which he is authorised by law to do alone any act authorised to be done by more than one Justice of the Peace" It is by this court that summary jurisdiction must ordinarily be exercised (S.J. Act 1879, s. 20 [p. and 1c.])

The position in London (excluding the city) is peculiar. Under the Metropolitan Police Courts Act 1830, a number of stipendary magistrates (commonly known as police magistrates) are appointed and sit at 14 police courts. The jurisdiction of the justices for the country of London was not expressly taken away, and in theory they possess a concurrent jurisdiction, but masmuch as by S. 42 of the Act of 1839 court fees in respect of proceedings elsewhere than in the police courts were prohibited, a practical obstacle was interposed which has prevented the jurisdiction of the process of the police courts were prohibited, as practical obstacle was interposed which has prevented the jurisdiction of the police courts were prohibited, as practical obstacle was interposed which has prevented the jurisdiction of the process of the police courts were prohibited, as practical obstacle was interposed which has prevented the jurisdiction of the property of the

Offences under the Conspiracy and Protection of Property Act 1875 are to be prosecuted before, and jurisdiction under the Law of Distress Amendment Act 1908 is to be exercised by, a stipendiary magistrate where there is one.

(5) Subject Matter of Criminal Jurisdiction.—(a) Summary Cases: It has been already stated that inclusive summary jurisdiction has been conferred in numerous criminal cases both by or under special statutory authority; this statement requires qualification.

(i.) When the offence is punishable by imprisonment for more than three months the person charged may claim to be tried by jury; to this there are at least two exceptions: a male person who knowingly lives wholly or in part on the earnings of prostitution or who in a public place persistently solicits or importunes for immoral purposes. Punishment: 6 months hard labour, without right to trial by jury (Crim Law Amend Act 1912 S 7 [2]) (11.) A like claim to the trial by jury may be asserted under the Explosives Act 1875 S. 92, and the Conspiracy and Protection

of Property Act 1875 S 9

(111 ) Some offences are triable either summarily or by indictment. eg, assault, some forms of public indecency, cruelty to children and the offences mentioned above under C.L.A. Act. 1012

(b) Indictable Cases Triable Summarily. Where an adult is charged with one of the offences specified in the second schedule to the Criminal Justice Act 1925 and the court thinks it is expedient and the accused consents, the court may try the case summarily, unless the case affects the property or affairs of His Majesty or of a public body, or unless the Public Prosecutor is prosecuting, in which cases the consent of the prosecutor is also necessary (C I Act 1925 S 24)

This statute greatly increases the number of indictable offences triable summarily, and confers wider, though more elastic, powers of punishment than any previous statute. The power to fine, which is particularly appropriate in some cases of dishonesty is not possessed by courts of Ouarter Sessions or Assize when

dealing with felonies

(6) Criminal Procedure .- (a) Procuring the Attendance of the Accused. Where the offence is originally indictable, the accused is brought before the court either on arrest without warrant or upon warrant or summons under the Indictable Offences Act 1848, and the charge cannot proceed in his absence

In summary cases, unless there has been an arrest by a constable under statutory powers, information is laid before a justice as to the offence, whereupon either a summons or a warrant may be issued. For a summons the information may be oral and unsworn, for a warrant it must be in writing and upon oath The information must be laid within six months from the commission of the offence unless a different time is limited by some particular statute (S.J Act 1848 S 11) or unless the offence is a continuing one. A warrant is not ordinarily granted in the first instance, except for a serious offence; but if the summons is disobeyed, a warrant may be issued upon proof of service The practice on this matter varies in different courts and according to circumstances Personal appearance is not in general The summons is served by a constable upon the accused either personally or by leaving it at his last or most usual place of abode, and should take place a reasonable time previous to the hearing.

(h) The Hearing: The hearing must take place in open court. and parties may appear by counsel or solicitor. If the accused does not appear and the court determines to proceed, the case must be proved in the ordinary way as if he had appeared. If the informant does not appear the case is dismissed, unless the court thinks proper to adjourn the hearing and to remand the accused either in custody (which would be very unusual) or on recognizance with or without surety. If the accused appears, he is asked to plead; if he pleads guilty, the court proceeds to

A police officer of whatever rank has no right ex officio, and should not be permitted to act as advocate or to take any part in the proceedings at all: that is, unless he is the actual informant: even in the latter event, whatever his actual right under the S.I. Act 1848, his activities should be confined, so far as possible, to those of a witness. The attendance of a witness may be enforced either by a Crown office subpoena or by a summons or warrant of a justice.

If there is a variance between the evidence and the information, and the party charged is prejudiced thereby, an adjournment on terms should be granted. At the close of the evidence for the prosecution, if the court is of opinion that there is a case to answer, the defendant may open his case and call his witnesses, subject to this: that if the defendant be the only witness on his side as to fact, he must be called immediately after the close of the evidence for the prosecution.

(c) The Judgment: The judgment follows the opinion of the majority of justices present at the hearing, and the chairman has no second or casting-vote. In the case of an equality of votes,

unless a justice withdraws his vote, the case should be adjourned for a rehearing before another court, when, if the same result ensues, the case should be dismissed. If the court decides to dismiss the information either upon the non-appearance of the informant or as being of opinion that the charge is not proved, it makes an order to that effect and may award costs to the defendant, but costs do not follow the event so frequently as in civil cases. If the charge is without foundation and the defendant is in no way to blame, there seems no reason why he should bear any part of the costs of the defence, whether the prosecution is by the police or by a private person, but a variety of considerations, generally unstated, influence the courts in this matter, and it cannot be pretended that there is any general or settled practice. If the defendant has pleaded guilty or the court is of opinion that the charge is proved, the court may either:

(1) Postpone judgment (either for consideration or to avoid inflicting sentence of imprisonment) and remand the defendant either in custody up to 8 days, in an appropriate case, or for that or a longer period, on recognizance, with or without sureties, or

(ii ) Convict the defendant, and commit him to the Assizes or Quarter Sessions in order that a sentence of detention in a

Borstal institution may be passed, or

(iii ) Convict and sentence the defendant. The maximum term of imprisonment and the maximum fine which can be inflicted are in general fixed by the statute or bye law creating the offence an order for costs can be included in the conviction. Whatever the provisions of the statute, or bye law, the imprisonment may be either with or without hard labour, and the court may reduce the term as it thinks fit or substitute for imprisonment (where no power to fine existed) a fine not exceeding £25 and not involving, on default, a longer term of imprisonment than that prescribed by the Act or bye law: and where a fine is prescribed, the court may, if it is imposed as in respect of a first offence, reduce the prescribed amount, or

(iv.) Without proceeding to conviction, where the court is of opinion that having regard to a variety of circumstances (see Probation of Offenders Act 1907 S. 1) make an order dismissing the information or charge, or discharge the defendant conditionally on his entering into a recognizance, with or without sureties, to be of good behaviour and to appear for conviction and sen-

tence at any time within not more than 3 years.

(d) Execution and Enforcement of Payment of Fines and Costs: Fines and costs, ascertained by conviction, are enforced by warrant of distress and, in default of distress, imprisonment on a scale set out in S 5 of the S.J. Act 1879. The court may issue a warrant of commitment in the first instance if the defendant has sufficient means to pay or if he does not ask for time to pay or has no fixed estate within the jurisdiction or for other special reasons. (See further C.J Act 1914 S. 25.) Where no fine has been inflicted but costs have been ordered to be paid either by the defendant or, upon dismissal, by the informant, recovery is by distress under SJ. Act 1848 S. 18 and C.J. Act 1914 S. 25. There are exempt from distress: the wearing apparel of the defendant and his family, and, to the extent of £5, the tools and implements of his trade. Provision is made in C.J. and S.J. Acts and rules for payment by instalments.

(e) Appeal: (i.) To Quarter Sessions: There is a general right of appeal against a conviction (including an order under S. z of the Probation of Offenders Act 1907) where the person aggrieved did not plead guilty (C.J. Act 1914 S. 37 [1]: C.J. [Amendment] Act 1926 S. 1), and against sentence after a plea of guilty (C.J. Act 1928 S. 25). There is no right of appeal against a dismissal, unless specially given by some statute. The procedure is regulated by the S.J. Act 1879 to which reference should be made to master the technicalities which are numerous.

(ii.) To the High Court by a Case Stated on a Point of Law: Such an application may be made by either party under the S.J. Acts 1857 and 1879. A recognizance, similar to that required on appeal to Quarter Sessions, is necessary. Generally speaking, the parties agree upon the form of the case; falling agreement the court settles the case. The court may refuse to state a case but only on the ground of frivolity; the court of King's Bench may rescand this refusal or order a case to be

(iii ) The court of King's Bench has further powers, on certain limited grounds, to restrain the exercise of or control a refusal to exercise jurisdiction by writ of prohibition and mandamus.

(7) Civil Procedure .- (a) As before stated, justices have been authorised by many statutes to make orders for the payment of money or otherwise, and some of the statutes contain special provisions as to the procedure to be observed. Mention is made of those most in use. Bastardy is specially dealt with under the Bastardy Acts 1872 and 1923 and the Affiliation Orders

Disputes between employers and workmen or apprentices are provided for by the Employers and Workmen Act 1875

A special code, applicable to certain differences between husbands and wives, is contained in the S J. (Married Women) Act 1805 as amended by the Married Women (Maintenance) Act 1920 and the S I. (Separation and Maintenance) Act 1925 and S. 5 of the Licensing Act 1902.

A limited jurisdiction in ejectment is conferred on justices by the Small Tenements Recovery Act 1838, at present qualified

by a variety of Rent Restriction Acts

In the absence of provision to the contrary in the Act conferring jurisdiction, the procedure is governed by such parts of the S I. Acts and rules as deal with orders and the recovery of civil debts. A summons is issued on complaint and not on information; and no warrant can be issued to compel attendance, On the hearing the civil laws of evidence apply To enforce an order for the payment of a civil debt or costs, in default of distress, a judgment summons, of which personal or substituted service is necessary, must be obtained If on the hearing of this summons it is proved that the defendant has or had, since the date of the order, means to pay, he may be committed for any term not exceeding 6 weeks. (S J. Act 1879 S. 35) Default in complying with an order other than for payment of money may be visited by an order to pay a sum (to be enforced as a civil debt) up to LI a day during default, not exceeding £20 in the aggregate, or for imprisonment, until compliance, for a period not exceeding two months.

(b) Appeal: There is no general right of appeal to Ouarter Sessions, in Bastardy, however, either party may so appeal, and various other statutes conferring civil jurisdiction include this right For instance the Pawnbrokers Act 1872 (on refusal of a certificate) and the Money-Lenders Act 1927 In matrimonial cases a special form of appeal hes to the High Court, Probate, Divorce and Admiralty Division.

The S.T. Acts 1857 and 1879 as to appeal by stated case apply to civil determinations in like manner as they do to criminal determinations, and the powers of the High Court as to write of certiorars, mandamus and prohibition can also be invoked.

(8) General Observations.-The public advantage of the courts is not confined to the work done in open court. The stipendiary magistrates, in London especially, act as friendly advisers of the poor, who flock to the courts for counsel and assistance. It must be confessed, however, that occasionally the need is felt for some further provision for the defence of the needy and ignorant persons in these courts. Societies for the protection of women and children play their part, the magistrate does what he can and even has been known to instruct a solicitor for the defence at the expense of the poor box. Yet still there is a gap to he filled. (H. W. W. WIL.)

#### THE UNITED STATES

with the institution of summary jurisdiction as developed in Stuart England and adapted it to the exigencies of their new life Reasons such as their distrusts of bureaucratic tyranny, the lack of trained lawyers, the limited need for criminal legislation, made for a reduction in the extent of summary jurisdiction. That a vigorous and extensive jurisdiction over minor offences was exercised is, however, clear. (See Frankfurter and Corcoran. Petty Federal Offenses and the Constitutional Guaranty of Trial by July, 39 Harvard L. Rev 917, 1926 ) Some of the colonies gave general summary unisdiction of all offences where the maximum numshment was a moderate fine and a moderate term of imprisonment. Special legislation conferred summary jurisdiction for petty offences such as swearing, gambling, illegal selling of liquor, profiteering, etc. The extent of this jurisdiction as being "a veritable social control in the daily lives of the people" is demonstrated by the fact that prior to the American Revolution the number of offences punished in the first instance by a single magistrate in Massachusetts amounted to 170, a figure equally illustrative of the extent to which summary jurisdiction prevailed in the other colonies.

Prior to the Revolution much antagonism was aroused by the Crown's denial of the right to trial by jury in a number of cases where traditionally such trial was had. This grievance of the colonists loomed large in the Declaration of Independence of 1776 and was responsible for the inclusion of provisions in the United States and State constitutions guaranteeing the right to trial by jury The relationship of these constitutional provisions to the recognized summary jurisdiction of the magistrates has proved a controversial issue in American law. It is quite clear, however, that their effect was not to introduce jury trial in all cases but that, whatever restrictions they placed upon the statutory extensions of summary jurisdiction, they left the existing ambit of that jurisdiction, in the main, untouched The history of that jurisdiction has controlled the courts in determining the scope of the constitutional provisions for trial by jury. Thus, the constitutional provision has been interpreted by various courts as not to deny the power of the legislature to confer summary jurisdiction upon magistrates in a variety of petty offences such as assault and battery, disorderly conduct, petty larceny, violations of game, food inspection, liquor, vagrancy, Sabbath-breaking and highway laws The test of what offences can be entrusted to the summary jurisdiction of single magistrates has been framed by the New Jersey court of errors and appeals in Katz v. Eldridge, 97 N.J.L. 123, 151. (1922), as follows. "The offence must be a petty and trivial violation of regulations established under the police power of the State in order that the offender may be summarily tried, convicted, and punished without indictment by a grand jury and without trial by a petit jury It must, of course, be assumed that the punishment for such a petty and trivial offence will also be comparatively petty and trivial, otherwise it would violate another provision of the State constitution which prohibits cruel and unusual punishments."

The constitutional problem arising from the guarantee of jury trials is present to a less degree in the grant of summary jurisdiction in civil cases. In some States the constitutional provision is expressly limited to criminal cases. In those where it includes civil causes its interpretation has followed the historical manner given to the provision applicable to criminal jurisdiction. To increase summary jurisdiction without infringing upon the constitutional right to jury trial, statutes commonly provide that unless such trial is expressly demanded by the defendant at a certain stage of the proceedings the magistrate is empowered to proceed as if the case fell within his summary jurisdiction

The extent to which magistrates exercise summary jurisdiction varies with the statutes of each State. In criminal matters it is exercised only in the broad class of petty offences. The furthest extent to which this classification has been enlarged concerned the breach of a State liquor law where the penalty prescribed amounted to a fine of \$500 and six months' imprisonment. No Summary jurisdiction in the United States, as in England, is summary jurisdiction has as yet been conferred upon the judicial the creation of statutes. The American colonists were familiar officials of the Federal Government. Federal crimes are limited

in character and of such a grave nature as would traditionally call for the benefit of a jury trial. The prohibition amendment to the United States constitution and the legislation thereunder punishing the manufacture, sale and transportation of intexicating houor did, however, thrust upon federal courts a large amount of trivial criminal business and brought to the forefront the desirability of establishing some system for federal summary jurisdiction.

In civil matters magistrates exercise a large summary jurisdiction The abatement of nusances, the collection of taxes, the enforcement of liens actions upon official bonds, quo warranto proceedings, the enforcement of awards, bastardy proceedings, are examples of classes of cases commonly entrusted to single magistrates In ordinary civil actions upon contracts, promissory notes, torts and the like, summary jurisdiction is conferred provided that the claim does not exceed a certain pecuniary limit Actions involving title to real property are generally excluded from grants of summary jurisdiction

The procedure in summary jurisdiction matters is more informal than otherwise. Matters of form are largely dispensed with and great liberality with respect to the proceedings is exercised Actions are commenced by summons which contains a short statement of the cause of action No formal pleadings are necessary and in many cases the pleadings are oral, the magistrate's entry showing their substance Defenses are also pleaded orally Many states, however, require the plaintiff to set out his cause of action in a bill of particulars and require the defendant to file a formal answer

The admission of evidence is governed by general common law principles though less exactness in their application is required Judgments may be sued upon or executed in the same fashion as other judgments of superior courts. Dockets are required to be kept, upon which a record of the proceedings must be entered. Review of the proceedings is generally accorded by statute by appeal or writ of error within certain limitations as to the amount involved The review is limited to those issues which were presented to the single magistrate and to the jurisdiction of that magistrate

Provisional remedies of ariest and attachment are also generally conceded to magistrates invested with summary jurisdiction. (J M LA.)

SUMMER SCHOOLS. These may be described briefly as educational courses conducted during the summer.

### GREAT BRITAIN

The long residential course of several months characteristic of the Danish folk high schools met with only a limited success in Great Britain, but from the beginning of the 20th century there was a growing demand for summer schools and week-end courses which adults could attend with little interruption of employment. Not only did such courses increase steadily in number, but they also enlarged their scope to cover a wide range of studies. When Bishop Nikolai Grundtvig and his followers created their folk high schools in Denmark in the middle of the 19th century they stressed the social aspect-"a feeling of comradeship"-and this became a notable feature of successful summer schools in Great Britain. From mid-July to mid-September such schools, organized in colleges and hostels, attract hundreds of students who come to study under expert guidance some branch of knowledge which interests them. The schools are usually arranged in places which can offer also the attraction of beautiful scenery or cultural amenities. Vacation courses were not unknown in Great Britain in the 19th century, the old science and art department (merged in the board of education in 1800) organized courses for teachers of science, and an annual summer school was arranged in connection with university extension classes. But the first strong impetus came from the modern adult education movement launched by Albert Mansbridge and others in 1903. The courses subsequently organized by the Workers' Educational association and the extramural departments of universities created a new demand for summer schools, and they became an important outcrop of the adult education movement. The tutorial classes provided a supply of keen students and, beginning with the Oxford Summer school of 1910, similar schools continued to develop elsewhere Thus in 1012 the Manchester joint committee of the university extramural department and the WEA organized its first summer school for students from tutorial classes, it is held annually at Bangor, North Wales Foreign students come increasingly to British summer schools, and as far back as 1904 the University of London estabhished a vacation course in "English for Foreign Students" Held annually, it had by the 1950s, an eniolment of more than 200 students from 30 countries, some coming from as far as Thailand, Ceylon and Indonesia

Many summer schools are organized by associations, societies. government, departments, industrial organizations and political parties The board (later the ministry) of education has for many years provided summer schools and courses for teachers Before World War II it was arranging about 50 yearly and after the war the number rose to 120, attended by nearly 6,000 teachers These courses deal with the main subjects of the school curriculum and with such educational problems as vocational guidance, domestic subjects, art and crafts, nursery, infant and junior school methods, the teaching of handicapped children, technical subjects, adult education, youth service, continuation schools, school meals, physical education and the training of teachers

Local authorities also provide courses for teachers in their service, and a few organize summer schools of a nonlocal character Several teachers' associations organize vacation courses, and among those arranged by the National Union of Teachers is one held annually in France. Various educational societies promote courses to stimulate interest in aspects of education that are their particular concern. The two wais interrupted the organization of summer schools, but the work of the Army Bureau of Curtent Affairs during World War II did much to encourage a wider interest in group discussion. This new interest was carried forward into civilian life by the Bureau of Current Affairs which operated for five years after the war with the help of the Carnegie United Kingdom trust. By lectures, talks and discussions the British Broadcasting corporation also greatly widened public interest in the service that summer schools and courses can render with the result that many large-scale organizations provide them for members of their staff. Thus in the early 1950s the national coal board's summer school was attended by about 450 students drawn from almost every branch of the coal-mining industry; they were housed in five Oxford colleges and spent a full week hearing lectures by experts and participating in group discussions.

(W. O. L. S)

# THE UNITED STATES

In the United States after the 1870s, and more especially after about 1905, universities and colleges offered instruction during the summer months. The earliest programs of summer study retained many of the qualities of the customary summer vacation. In 1869 Dean Shaler arranged a field trip in the mountains of Colorado for students of geology at Harvard university, Cambridge, Mass Louis Agassiz of Harvard offered field work in a zoological laboratory established on Penikese Island in Buzzards Bay, Mass., in 1873 In 1880 C O. Whitman founded the Marine Biological labora-

tory at Woods Hole, Mass., as a centre for researchers in hiology.

An early form of summer study which greatly influenced the rrowth of schools was the Chautaugua summer assembly (see LYCEUMS AND CHAUTAUQUAS) which began with a ten-day session in 1874, enlisting the co-operation of many notable scholars and educators. One of these, William Rainey Harper, who conducted courses in Hebrew and in Old Testament literature, became president of The University of Chicago in 1801. Moved by the success of his Chautauqua experience he provided for a university calendar of four quarters, of which the summer one was an integral part of the university year Shortly thereafter other universities provided for summer sessions, many of them offering courses which could be counted toward the baccalaureate degree. among these were (1893) University of Nebraska, Lincoln; (1894) University of Michigan, Ann Arbor; (1896) University of Illinois, Urbana; (1897) Clark university, Worchester, Mass, Cornell university, Ithaca, NY, and Ohio university, Athens, (1899) University of California, Berkeley; (1900) Columbia university, New York,

One of the factors contributing to the growth of summer schools was the demand for trained teachers in a rapidly expanding system of public schools. During the first quarter of the 19th century teachers depended for help upon the county "normals," one-day conventions which were held at many points throughout the country By 1850 more elaborate institutes, often of two weeks duiation, were common, and were provided for by law in several states.

The first six-weeks summer course in education for public school teachers was offered at Martha's Vineyard, Mass , in 1878 This school emphasized teaching methods and in 1890 enrolled 700 students in its elementary, high school and academic departments. Because of the seasonal nature of public school teaching and the rapid increase in numbers of public school teachers, U S summer schools until the middle 1920s offered chiefly undergraduate courses in educational methods After the 1920s, standards of qualification for public school teachers reached so high a level that the emphasis of this aspect of summer schools, especially at the large universities, shifted toward postbaccalaureate courses.

A development in summer schools after World War II was the introduction of highly specialized conferences, workshops and seminars for selected groups of professional and industrial people. For example, in the summer of 1953 two universities offered special courses for electrical engineers on the subject of transistors. Other courses announced by various institutions included "Digital Computers and their Applications," "Mathematical Problems of Communication Theory," and "The Basic Process of Rorschach Technique" Courses of this sort vary in length from one day to several weeks. They make the results of research at educational institutions available to industrial technicians, teachers, and other professional persons. Their students are mature persons who usually do not wish to acquire additional academic credit or de-

Summer sessions of varying lengths are often provided within a single institution. At universities employing a calendar of four quarters, many courses offered in the summer quarter are so organized that students may enrol and receive credit for either the first or the last five or six weeks of the quarter. Other institutions schedule sessions of different lengths, as in 1952 Northwestern university, Evanston, Ill, scheduled 6-week, 9-week, 11-week, 8-week, 3-week, and 2-week sessions, all lunning con-(H W. Ss.) currently.

SUMMER TIME: See DAYLIGHT SAVING.

SUMMIT, a village of Cook county, Illinois, U.S., on the Illinois and Michigan canal, II mi. S.W. of the Chicago "loop." It is served by the Gulf, Mobile and Ohio railway.

The population was 8,957 in 1950; in 1940 it was 7,043; in 1930

The population was 0,937 in 2,937, in 2,937, in 1,937, in 1,937, in 1,937, in 2,937, i tain; served by the Lackawanna and the Rahway Valley railways. Population (1950) 17,929; in 1940 it was 16,165, federal census. It is a residential suburb, with private schools and some manufacturing. Summit was chartered as a city in 1899.

During the American Revolution it was known as Turkey Hill; a signal tower on the crest warned Washington's army of the

movements of the British.

SUMMIT HILL, an anthracite mining borough of Carbon county, Pennsylvania, U.S., served by the Lehigh and New England railroad. Pop , 4,924 in 1950; 5,406 in 1940; in 1930 it was 5,567. It has a famous burning mine, which first caught fire in 1832.

The Mauch Chunk Switch-Back railway, now abandoned, was built in 1827 by the Lehigh Coal and Navigation company for transporting coal after anthracite was discovered by Philip Ginter in 1791, and was said to have been the oldest railroad in the United States

SUMMONS: see PRACTICE AND PROCEDURE.

SUMNER, CHARLES (1811-1874), American statesman, was born in Boston, Mass, on Jan 6, 1811. He graduated in 1830 at Harvard college, and in 1834 at the Harvard law school At the age of 23 he was admitted to the bar The three years (1837-40) spent in Europe were years of fruitful study and experience

In his 30th year Sumner returned to Boston, to settle down to the practice of law But gradually he devoted less of his time to practice and more to lecturing in the Harvard law school

Sumner co-operated effectively with Horace Mann for the improvement of the system of public education in Massachusetts Prison reform and peace were other causes to which he gave support. He took an active part in the organizing of the Free Soil Party, in revolt at the Whigs' nomination of a slave-holding Southerner for the presidency; and in 1848 was defeated as a candidate for the National House of Representatives. In 1851 control of the Massachusetts legislature was secured by the Democrats in coalition with the Free Soilers, but the Democrats refused to vote for Sumner, the Free Soilers' choice for US senator, and urged the selection of some less radical candidate. A deadlock of more than three months ensued, finally resulting in the election (April 24) of Sumner by a majority of a single vote

In the closing hours of his first session, in spite of strenuous efforts to prevent it. Sumner delivered (Aug. 26, 1852) a speech, "Freedom national; Slavery sectional," which marked a new era in American history The conventions of both the great parties had just affirmed the finality of every provision of the compromise of 1850 In 1856, at the very time when "border ruffians" were drawing their lines closer about the town of Lawrence, Kan, Sumner in the Senate (May 19-20) laid bare the "Crime against Kansas" He denounced the Kansas-Nebraska bill as in every respect a swindle, and held its authors, Stephen A Douglas and Andrew P Butler, up to the scorn of the world. Two days later Preston S. Brooks (1819-57), a Congressman from South Carolina, confronted Sumner in the Senate chamber, denounced his speech as a libel upon his State and upon Butler, his relative, and struck Sumner till he fell unconscious to the floor. This assault cost Sumner three years of heroic struggle to regain his healthyears during which Massachusetts re-elected him, in the behef that in the Senate chamber his vacant chair was the most eloquent pleader for free speech and resistance to slavery

After the withdrawal of the Southern senators, Sumner was made chairman of the committee on foreign relations (March 8, 1861), a position for which he was pre-eminently fitted by his years of intimate acquaintance with European politics and statesmen. While the war was in progress his letters from Cobden and Bright, from Gladstone and the duke of Argyll, at Lincoln's request were read by Sumner to the Cabinet, and formed a chief source of light as to political thought in England In the turmoil over the "Trent Affair," it was Sumner's word that convinced Lincoln that Mason and Slidell must be given up, and that reconciled the public to that inevitable step

Throughout the war Sumner had constituted himself the special champion of the negro, being the most vigorous advocate of emancipation, of enlisting the blacks in the Union army and of the establishment of the Freedmen's bureau The credit or the blame for imposing equal suffrage rights for negroes upon the Southern States as a condition of reconstruction must rest with him.

In the impeachment proceedings against Johnson, Sumner was one of the President's most implacable assailants. Sumner's opposition to Grant's pet scheme for the annexation of San Domingo (1870), brought upon him the President's bitter resentment. Sumner had always prized highly his popularity in England, but he unhesitatingly sacrificed it in taking his stand as to the adjustment of claims against England for breaches of neutrality

Under pressure from the President, on the ground that Sumner was no longer on speaking terms with the secretary of State, he was deposed on March 10, 1871, from the chairmanship of the committee on foreign relations Whether the chief cause of this humiliation was Grant's vindictiveness at Sumner's opposition to his San Domingo project or a genuine fear that the impossible demands which he insisted should be made upon England, would wreck the prospect of an adjustment with that country, cannot be determined Sumner's last years were further saddened by the misconstruction put upon one of his most magnanimous acts. In 1872 he introduced in the Senate a resolution providing that the names of battles with fellow-citizens should not be placed on the regimental colours of the United States. The Massachusetts legislature denounced this battle-flag resolution as "an insult to the loyal soldiery of the nation" and as "meeting the unqualified condemnation of the people of the Commonwealth" For more than a year all efforts-headed by the poet Whittier-to rescind that censure were without avail, but early in 1874 it was annulled On March 10 against the advice of his physician, Sumner went to the Senate-it was the day on which his colleague was to present the rescinding resolution. That night he was stricken with an acute attack of angina pectors, and on the following day he died

"The slave of principles, I call no party master," was the proud avowal with which Sumner began his service in the Senate. His was the first clear programme proposed in Congress for the reform of the civil service. It was his dauntless courage in denouncing compromise, in demanding the repeal of the Fugitive Slave Act, and in insisting upon emancipation, that made him a great propelling force in the struggle that put an end to slavery great propeiling iorce in the struggie that put an eine to stavery See Summer's Works (Boston, 1870-83), and Edward L. Petere's Memoir and Letters of Charles Summer (Boston, 1877-93). Britographies have been written by Anna L. Dawes (New York, 1891); Moorfield Storey (Boston, 1900), and George H. Haynes (Phila-delphia, 1909). See also Charles Summer, His Camplete Works with an introduction by G. F. Hoar (Boston, 1910); W. G. Slotwell, Life of Charles Sumner (1910), A. N. SUMNER, EDWIN VOSE (1797-1863), American soldier, was born at Boston (Mass ), and entered the U.S. Army in 1819. He took part in the Black Hawk war and served many years on the frontier. For distinguished action in the Mexican war, he received the brevet rank of colonel From 1851-53 he served as military governor of New Mexico At the outbreak of the Civil War (1861) Sumner had just been promoted to the rank of brigadier-general, and was sent to relieve Sidney Johnston in command of the department of the Pacific. The following year, he was recalled to command the 1st Corps of the Army of the Potomac At the battle of Fredericksburg he commanded the right grand division under Burnside. Upon Hooker's appointment to chief command of the eastern army, Sumner was assigned to command the department of Missouri, and died suddenly, on March 21, 1863, while on his way thither SUMNER, WILLIAM GRAHAM (1840-1910), Ameri-

can economist, was born, of English parentage, in Paterson (N J.), on Oct. 30, 1840. He was brought up in Hartford (Conn.), graduated at Yale college in 1863, studied French and Hebrew in Geneva in 1863-64 and divinity and history at Gottingen in 1864-66, and in 1866-69 was a tutor at Yale.

He was ordained a priest of the Protestant Episcopal Church in 1869, was assistant rector of Calvary Church, New York city, and in 1870-72 was rector of the Church of the Redeemer, Morristown (N.J.). From 1872 to 1909, when he became professor emeritus, he was professor of political and social science at Yale. In 1909 he was president of the American Sociological Society.

He died at Englewood (N.J.), on April 12, 1910.
SUMPTUARY LAWS, those laws intended to limit or regulate the private expenditure of the citizens of a community. They have existed both in ancient and in modern States. In Greece, it was amongst the Dorian races, whose temper was austere and rigid, that they most prevailed. All the inhabitants of Laconia were forbidden to attend drinking entertainments, nor could a Lacedaemonian possess a house or furniture which was the work of more elaborate implements than the axe and saw.

At Rome the system of sumptuary edicts and enactments was largely developed, whilst the objects of such legislation were concurrently sought to be attained through the exercise of the censorial power. The code of the Twelve Tables (q.v.) has provisions limiting the expenditure on funerals The most important sumptuary laws of the Roman commonwealth were the following:-

except on occasions of public religious ceremonies. This law, which had been partly dictated by the financial necessities of the conflict with Hannibal, was repealed 20 years later, against the advice of Cato (2) The Orchian law, 187 Bc, limited the number of guests at entertainments (3) The Fannian law, 161 BC., limited the sums to be spent on entertainments, it provided amongst other things that no fowl should be served but a single hen, and that not fattened (4) The Didian law, 143 BC, ex tended to the whole of Italy the provisions of the Fannian law, and made the guests as well as the givers of entertainments at which the law was violated liable to the penalties After a considerable interval, Sulla anew directed legislation against the luxury of the table and also limited the cost of funerals and of sepulchral monuments. Julius Caesar, in the capacity of praefectus moribus, after the African war re-enacted some of the sumptuary laws which had fallen into neglect Suetonius tells us that Caesar had officers stationed in the market-places to seize such provisions as were forbidden by law, and sent lictors and soldiers to feasts to remove all illegal eatables (Jul 43) Augustus fixed anew the expense to be incurred in entertainments Tiberius also sought to check inordinate expense on banquets.

In modern times the first important sumptuary legislation was: in Italy that of Frederick II; in Aragon that of James I in 1234; in France that of Philip IV, in England that of Edward II. and Edward III In 1294 Philip IV of France made provisions as to the dress and the table expenditures of the several orders of men in his kingdom Charles V. forbade the use of long-pointed shoes, a fashion against which popes and councils had protested in vain. Under later kings the use of gold and silver embroidery, silk stuffs and fine linen wares was restricted. In England we hear much from the writers of the 14th century of the extravagance of dress at that period In the reign of Edward II. a proclamation had been issued against the "outrageous and excessive multitude of meats and dishes which the great men of the kingdom had used, and still used, in their castles." In the year 1336 Edward III attempted also to legislate against luxurious living, and in 1363, at the same time when costumes were regulated, it was enacted that the servants of gentlemen, merchants and artificers should have only one meal of flesh or fish in the day, and that their other food should consist of milk, butter and cheese An act of 1444 had regulated the clothing, when it formed part of the wages, of servants employed in husbandry; a bailiff or overseer was to have an allowance of 5s a year for his clothing, a hind or principal servant 4s, and an ordinary servant 3s. 4d -sums equivalent respectively to 50s, 40s, and 33s 4d of modern money. Another statute was passed in the year 1462 (3 Edw. IV c 5) for the regulation of the diess of persons of all ranks. Similar acts to those above mentioned were passed in Scotland also. In 1433 (temp. James I.), by an act of a parhament which sat at Perth, the manner of living of all orders in Scotland was prescribed, and in particular the use of pies and baked meats, which had been only lately introduced into the country, was forbidden to all under the rank of baron. In 1457 (temp James II) an act was passed against "sumptuous cleithing." The Scottish sumptuary law of 1621 was the last of the kind in Great Britain

kind in Great Britam

SUMTER, THOMAS (1734-1832), American soldier, was born in Hanover county, Va., on July 14, 1736. He served in the French and Indian War, and was present at Braddock's defeat in 1755. Later he removed to South Carolina. After the fall of Charleston in 1780, when his State was ravaged by the British, he escaped to North Carolina, where he took the field as brig.-general (i) The Oppian law, 215 s.c., provided that no woman should at the head of a body of light horse and soon became one of the possess more than \( \frac{1}{2} \) oz. of gold, or wear a dress of different most active and able leaders of the other. His vegilance and colours, or ride in a carriage in the city or within a mile of it bravery earned for him the sobriquet of "Gamecock." After

(Lancaster county), he was surprised and defeated by the British general, Tarleton, at Fishing Creek (Chester county) Raising a new force, he defeated Mayor Wemys at Fishdam (Union county) and repulsed Tarleton's attack at Blackstock (Umon county) in Nov 1780 At the time of his death at South Mount, SC. on June 1, 1832, he was the last surviving general officer of the War of Independence

See Edward McCrady, The History of South Carolina in the Revolution (1901-02); H A M Smith, "General Thomas Sumter" in Magazine of History (vol. 8, 1908, and vol. 9, 1909).

SUMTER, a city of South Carolina, USA, the county seat of Sumter county; 45 mi. E.S E. of Columbia, on U.S. highways 15-15A and 76. It is served by truck, bus lines, and the Atlantic Coast Line and the Seaboard Air Line railways Pop. 20.185 in 1050 Woodworking is its main industry. Sumter was founded in 1800, named for Gen. Thomas Sumter, and chartered in 1887. It was the first city to adopt (1912) the commission-manager form of government. The Swan Lake Iris gardens are there.

SUMY, a town of the Ukrainian S.S R., in 50° 56' N , 34° 47' E, on the Isel river, a tributary of the Psiol, and on the railway It is a grain and beet-collecting centre and has an elevator Its industries include the making of agricultural machinery, sugar refining, woollen, cloth and leather manufacture, and saw-milling, Pop (1939) 53,883. SUN. The sun is apparently the largest and brightest, and

actually almost the smallest and faintest, of naked-eye stars The illusion, of course, arises from its comparative nearness-the next nearest star is, in fact, nearly 300,000 times as far away.

### TELESCOPIC INVESTIGATION

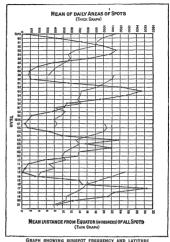

General Characteristics .- The sun presents to the telescopic view a dazzling white circular disc, with a sharp edge, whose diameter subtends an angle of about half a degree Slight but systematic variations of the angular diameter reveal the fact that the distance from the earth to the sun is not constant, and that the earth's orbit is an ellipse with the sun at one of the foci. Several methods have been employed to measure the various distances of the sun from the earth; it will suffice to describe one of them Early in the 17th century Johann Kepler, by the method of trial and error, discovered rules from which an accurate plan of the solar system could be drawn, although the scale could not be given It then became necessary only to measure at some instant the distance between any two of the bodies represented in the plan in order to fix the scale for the whole. A minor planet named Eros at certain times in its career comes within 14 million miles of the earth, and if its direction be then measured simultaneously from two places at a known distance apart on the earth the distance of the planet can be calculated from the angle between the directions A scale is thus obtained from which the distance of the sun from the earth at any time follows immediately. The mean value throughout the year (from which the actual distance never departs much) is found to be about 93,000,-000 miles. This is generally expressed by saying that the solar parallax is 8".79 (i.e., 8.79 seconds of arc), the solar parallax being the angle the earth's equatorial radius subtends at the distance of the sun.

The sun's linear diameter follows at once from this measurement and the observed angular diameter. It is approximately 865,400 miles-far transcending the powers of imagination, but small as stellar diameters go; the sun is, in fact, a dwarf star. Its mass is calculated from the force with which, according to Newton's law of gravitation, it attracts the earth, whose mass is separately determined (see EARTH). The result-2×1088 gms., i.e., 2×10<sup>27</sup> tons, or 333,400 times the mass of the earth—is about the average for stellar masses. Mass and diameter are sufficient data for the estimation of the mean density of the sun, viz .- 1.41 times that of water. This figure, of course, affords no information about the density in any particular region or the rate of variation of density from the surface inwards,

Close examination of the night sky over a prolonged period

successes over the British at Catawba and at Hanging Rock on the whole, to be getting farther apart, whereas, in the opposite direction, they appear to be gathering together This is interpreted as an indication that the sun, with its attendant satellites, is moving towards a point in the former region

Surface Features -These general characteristics must now be supplemented by more mtimate knowledge. When the surface of the sun is carefully examined it is found to present a grained

The scale on the left indicates the spotted area with a unit of one-millionth of the Sun's visible hemisphere During a complete cycle—i.e., from one minimum to the next—the solar latitude at which the spots break out changes in the manner indicated by the thin lines. As the cycle progresses there is a fairly steady approach to the equator, which, however, is never

structure; the appearance has been likened to that of rice grains and even willow leaves. The brightness of the disk in other respects also is not uniform; the region near the circumference. or lsmb, is appreciably less bright than the centre of the disk-a fact which appears most obviously in photographs. More striking violations of uniformity are caused by sunspots, which are frequently visible, sometimes even to the unaided eye. A sunspot generally consists of a central, apparently black, umbra, surrounded by a less dark penumbra. It should be said at once that each of these regions is in reality exceedingly bright, and appears dark only by contrast with the still brighter solar disk

Spots often are clustered together in groups, but perhaps even more significant is their characteristic of associating in pairs. They move steadily across the face of the sun in such a manner as to leave no doubt that the motion is due to a rotation of the sun about an axis. The sun, therefore, like the earth, is approximately a sphere, and its bright visible surface is accordingly known as the photosphere. A remarkable feature of the sun's rotation is that it does not take place at the same rate in all latitudes; ie., the sun does not rotate as a rigid body; the nearer to the equator the faster is the rotation. Sunspots very rarely shows that around the constellation Hercules the stars appear, appear outside two zones of the photosphere, bounded by circles of latitude about 5° and 40° N and S respectively Near the equator, the mean rotation period is 24 65 days, at solar latitude 20°, it is 25 19 days, at 35°, 26 63 days, and at 60° from the

Doppler effect (p 562) 30 93 days.

Individual sunspots appear spasmodically, remain visible for periods varying from one day to several months, and then disappear. This apparently capticous behaviour, however, contributes to a striking regularity which is revealed only when large numbers of spots and a great length of time are considered. Samuel Heinrich Schwabe, in 1843, tound that if the number of spots appearing per year (or the total area covered by them) were plotted against time, as in the dagram, a markedly periodic relation was shown, he number resching a maximum approximate requirity characterized the location of the spots. At a time of minimum those of a new cycle began to appear in the higher latitudes, both north and south, of their appointed bels, and as the cycle progressed the place of outbreak gradually moved towards the equator. The thin lines in the figure illustrate this

Sunspots are often accompanied by exceptionally bright areas on the photosphere, known as *faculae* They are most easily seen near the limb, where the brightness of the photospheric back-

ground is diminished.

On the comparatively rare occasions on which the sun is observed in eclipse, red flames are seen apparently rising from various points on the circumference of the dark moon. They belong in realty to the sun, and are known as promeneate: They are not seen through the telescope alone in full daylight, because the intense photosphere light, diffused by our atmosphere as by a screen of ground glass, acts as a veil through which promunences and stars alike are invisible as individual objects although their radiation contributes to the sum total of the light of day. Prominences assume various shapes and sizes, sometimes reaching heights of hundreds of thousands of mules, On such occasions they can easily be seen by the naked eve during eclipses

The most striking solar echpse phenomenon, however, is the corona, a pearly white halo enveloping the sun and extending in more or less definite rays or streamers to a distance of several of its radii. The brilliance of the corona diminishes fairly rapidly with distance from the sun's limb, and although its total brightness is not far short of that of full moon, it is still less able than the prominences to maintain the individuality of its appearance in full daylight. No two aspects of the corona seen at different eclipses are identical, but here again the apparent arbitrariness is subject to conformity with a rather vague but unquestionable relation with the sunspot period. At sunspot maximum the corona appears to extend from the sun's limb to roughly the same distance all around. At sunspot minimum, on the other hand, the poles of the sun are marked by comparatively small tufts of light, while from the equatorial regions long streamers shoot out to great distances. There is also a not fully determined relation between the corona and prominences of certain types.

### SPECTROSCOPIC INVESTIGATION

General Considerations.-The spectroscope is an instrument by means of which a beam of light is analyzed into its constituent colours, or wave lengths. The analyzed radiation of a substance is called its spectrum, and the instrument is constructed to show each colour radiated as a thin vertical line; hence the term spectra line is often used to denote a particular colour. When, in the laboratory, a substance is vaporized and made luminous, the light it emits, when analyzed by the spectroscope, appears as a collection of isolated lines and is characteristic of the substance. On the other hand, a glowing solid, liquid or gas, under great pressure or of great depth, such as is found in the stars, radiates light of all wave lengths (within rather ill-defined limits), appearing in the spectroscope as a continuous band of colour ranging from red to violet in the order of the colours of the rainbow. This is known as a continuous spectrum Again, when a beam of light which, if analyzed, would form a continuous spectrum, is allowed to pass through a less brightly glowing vapour which, acting alone, would give a line spectrum, and is then received by the spectroscope, the spectrum formed consists of a continuous background on which dark lines appear exactly in the postions of the bright lines which the interposed vapour would give by itself. This is called an absorption spectrum The glowing vapour absorbs, from the light passing through it, precasely those colours which it can itself emit. Absorption lines are not absolutely dark They contain the light emitted by the glowing vapour.

The Solar Spectrum.—The spectrum of the sun is an absorption poetrum. This gives us immediately a piece of knowledge which the telescope was powerless to reveal, namely, that the sun has an atmosphere of glowing vapours surrounding the brilliant photosphere. Further, it enables us to ascertain the elements which make up this strongshere by simply companing the postions of wave lengths, of the absorption lines with those of the emission lines produced by known substances in the laboratory. In this manner the presence in the solar atmosphere of 66 elements when when the earth (including a few doubtful identifications) has been established. For many of the remaining elements, solar conditions are unfavourable for the production of observable

lines; most of the rest are very rare

The existence of the solar atmosphere is revealed in another way during times of total eclipse. When the moon has just covered the last remnant of photosphere, the crescent of the atmosphere which still remains exposed for a few seconds gives a bright line spectrum, for the glowing vapours there have no bright photosphere behind them. On account of its evanescence, this spectrum is known as the flash, and it is, of course, essentially identical with the Fraunhofer, or absorption, spectrum in the positions of its lines Careful observation at such times enables the heights reached by the various substances to be determined It is found that the majority are confined to the lowest atmospheric layer, not more than 500 miles high, known as the reversing layer. Hydrogen, helium and calcium charged with positive electricity (sonised calcium), however, reach much greater heights, extending up to 8,000 or 9,000 miles, and form a relatively thick upper stratum of the atmosphere, which is known as the chromosphere on account of the red colour imparted to it by the glowing hydrogen Prominences are eruptions of hydrogen.

The portion of the solar atmosphere just outside the sun's limb might be expected to give a bright line spectrum in full daylight. It does not do so, however, because of the diffused photospheric light in the earth's atmosphere which masks the bright radiations. Pierre Jules César Janssen and Joseph Norman Lockyer, in 1868, independently succeeded in partially overcoming this difficulty II the dispersion of the spectroscope (£a., its power of separating the colours) is increased, the intensity of the continuous spectrum at any one point is diminished, while the lines in a bright line ness. Janssen and Lockyer found it possible so to weaken the diffused daylight that the bright lines of the chomosphere and prominences became visible

When the spectroscope is directed towards the corona, it is found that a great deal of the coronal light yields the ordinary Fraunhofer spectrum and is therefore reflected sunlight. But there is also light which must originate in the coron itself, for it gives a spectrum of which part is continuous and part is composed of bright lines which have not yet been matched terrestrially. The name coronism was one given to a hypothetical element which was once held to raduate the lines; but Bengt Eddlen has shown that almost all the coronal lines can be identified with radiations which would be emitted by isolated and very highly ionized atoms of fron, nickel and calcum.

Spectra and Physical Conditions—This change of spectrum with change of physical conditions is one of the most important phenomena of spectroscopy. We shall at this stage consider three of its aspects without inquiring into their theoretical foundations. They are, respectively, the effect on a line spectrum of temperature, a magnetic field, and motion of the source of light.

When a luminous compound body is gradually raised in temperature, changes of spectrum of two kinds take place successively. First, the spectrum of the compound gives place to the lines of the constituent elements as the compound becomes dissocated by heat; secondly, the earliest elementary lines to appear slowly lade out, while new lines\_come into view and are gradually strengthened Spectrum lines may therefore be roughly classified into "high temperature" lines and "low temperature" lines These observations have an important application when the spectra of the photosphere and a sunspot are compared. The spectrum of the spot contains evidence of compounds of which only the separated elements contribute to the photospheric spectrum, and, furthermore, the spot spectrum shows a strengthening of "low compared with the spectrum of the photosphere. The obvious conclusion is that the vapours over a sunspot have a lower temperature than the rest of the solar atmosphere.

A source of light placed in a magnetic field (i.e., a region such us the neighborhood of the poles of a magnet, m which a freely suspended compass needle is constrained to be in a definite direction) has each of its spectrum lines split into a number of component lines, lying side by side Unless the field is a very strong one, the components are too close together to be seen as distinct individuals and the lines merely appear to be broadlened. By means of special appliances, however, the existence of the separate components can be detected. In 1908 George Ellery Hale, using such appliances, found that the lines in the spectrum of a sunaport such appliances found the such lines in the spectrum of a sunaport of the support of the sup

to the sun's statuce.

Further observations showed that all sunspots are magnets, some presenting a north, and others a south pole to the surrounding space. In each pair of spots, the leader and the follower in the journey round the sun's axis had opposite polarities: Indeed, many provides to the property of the polarity in the sun's provides to the provides of the polarity in the sunthern solar hemisphere as compared with the northern; thus, if the leader of a pair were a N-pole in the northern thus, if the leader of a pair were a N-pole in the northern shapes, at vowe the northern the provides and the polarity in the sunthern solar hemisphere, and vue versa and, with few exceptions, this order would characterize all spots from one minimum to the next of a sunspot space, and vice versa, and, with few exceptions, this order would be reversed, so that the approximate period of a complete set of sunspot shenomena turned out to be, not it but az years.

More refined investigations of the same kind have shown that the sun as a whole is a magnet, just as the earth is. Its field, however, is much weaker than that of a spot, being only so gausses at its strongest observable region (the base of the reversing layer) as compared with about 4,000 gausses in large spots. (The maximum value of the earth's field is roughly 0.5 gauss)

The third of the effects mentioned above—that of motion of the source of light, or Doppler effect, as it is called—has had may and varied applications. When the distance between an observer and a source of light is decreasing the wave length of every line emuted is lessened by an amount proportional to the wave length itself and to the rate of approach. When the distance is increasing the wave length is augmented in a similar manner. This shows itself by a displacement of the spectrum lines compared with their normal positions, and the amount and direction of the displacement indicate the velocity of approach or recession.

This effect has been used to measure the speed of the sun's motion among the stars. The displacement of spectrum lines, when properly analyzed, shows that the solar system is moving at a speed of about 12 miles per second among the stars.

Another application of the Doppler effect to the sun is the verification of the speed of rotation by observing the rates of approach of the east limb and recession of the west limb. The values obtained agree very well with those indicated by the spots, and the observations can be extended beyond the belts to which the spots are confined. The same spectra can be used for a further purpose; namely, to determine what lines in the solar spectrum are produced by absorption in the earth's atmosphere. Our atmosphere, though not-luminous, is able, in great thickness, to absorb cortain lines (nown as tellular lines) proper to its constituents, which are mixed with the true solar lines in the ordinary Fraunbofer spectrum. Such lines, however, occupy identical positions

by heat; secondly, the earliest elementary lines to appear slowly in the spectra of the two limbs and are therefore readily distinfade out, while new lines\_come into view and are gradually guished from the displaced solar lines.

One of the most difficult and important applications of the Doppler effect is to the detection of atmospheric currents in the sun itself Solar storms not infrequently occur, of incomparably greater fury than the hurricanes and tornadoes of the earth, and the violent motions of the solar gases are revealed by distortions and displacements of the spectrum lines. Eruptive prominences are often the results of such storms But there are more systematic movements also which have been brought to light in the same way, and of these perhaps the most interesting are the movements occurring near sunspots The researches of John Evershed and Charles Edward St. John have shown that in the lower atmospheric levels gases move upwards and outwards from a spot, while in the higher levels the movements are inwards and downwards, as if a spot were a sort of whirlpool into which the high level gases are drawn. Indeed, there is definite evidence of high level circulatory movements round the axes of spots, which point strongly to the same conclusion

#### SPECTROHELIOGRAPHIC INVESTIGATION

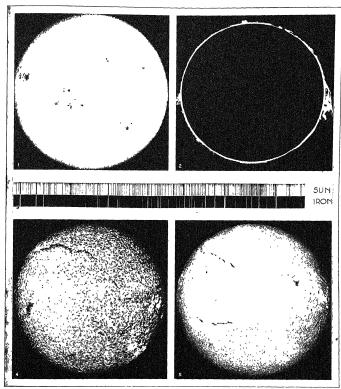

It has been saud that the absorption lines in the solar spectrum contain light emitted by the glowing atmospheric gases; it is the photospheric light that is absorbed. The spectrobeliograph is an instrument which gathers the light in a particular spectrum line and builds up a picture of the solar atmosphere in the light of that line, showing thereby how the substance producing the line is distributed in the solar atmosphere. The construction of the instrument is explained in the article SPECTROMENIOGRAPH. Some of the results which it produces are shown in Plate I, figs. 4 and 5

It is clear that the evidence of the spectroscope and spectroheliograph points the way to a fairly complete knowledge of solar meteorology, from which it appears that the structure of the solar atmosphere is anything but uniform. Atoms congregate in clouds, or flocculi, particularly in the regions of sunspots, where they form the faculae observed through the telescope Different substances are differently distributed, and the distribution of each substance is in a state of continual flux. The restless turmoil of the solar atmosphere stands in striking contrast to the comparative quietude and regularity of our own air Yet even in the sun the motions are not wholly chaotic. On the large scale there is a consistency which points to a fundamental equilibrium. There is a fairly well defined limit to the ascent of each substance above the photosphere, we never find sodium so high as hydrogen, for example. Spectroheliograms are markedly characteristic in appearance for each substance; the coarse mottled structure of the calcium clouds is immediately distinguishable from the finergrained layers of hydrogen, inconstant as each of them may be in detail. Once more there is a foundation of law and order to the superficial irresponsibility.

## BOLOMETRIC INVESTIGATION

The Sur's Total Radiation—One of the most important characteristics of the sun is its practice of radiating energy. Of the 3-79 × 10<sup>-38</sup> ergs which it discharges every second in the form of light, best, and other ethereal vibrations, its attendant planets and their satellites receive about one part in 120 million, so that he significance of the process is cosmic rather than human. This enormous quantity of energy is sent forth regularly and ceaselestly, and goes no one knows whither or to what end. In seeking there knowledge of this fundamental process the first step to be taken is the measurement of the precise rate of radiation, for which purpose use has been made of various instruments bearing the generic name, bolometer.

Owing to natural limitations we can measure only the radiation received by a small area of the earth's surface, but, knowing the dimensions of the solar system, we can readily deduce the total amount. The general method is to convert the sun's radiation into heat, which can be accurately measured—making an allowance, which must be estimated from separate investigation, for absorption but he earth's strusobhere. The result is usually example.

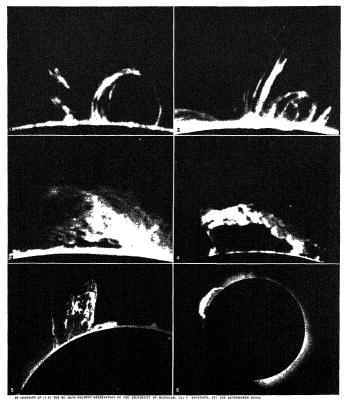

PHOTOGRAPHIC STUDIES OF THE SUN

- The photosphere of the sun, showing an unusually large number of spots, facules, and darkening at the limb (Rutherfurd)
  Photograph taken in calcium light, the image of the photosphere having been artificially covered. Shows Chromosphere and Prominences (Everhebe)
- 3 Comparison of solar spectrum with laboratory spectrum of Iron (violet
- region). Presence of Iron in the atmosphere of the sun is indicated by coincidence in positions of lines (importal College).

  4 Spectrobeliogram (photograph of sun made by monochromatic light) showing distribution of high level calcium in the solar atmosphere (Deslander).
- 5 Spectroheliogram showing distribution of hydrogen is the solar atmosphere (Deslandres)

- 20% during we person to users with a fine and a markable suspective prominence of Seat. 7, 12959, recorded in a markable suspective progressed, the general pattern became intricate, developing a background of faint (plantic losses and many small soodensations might high velocities toward the chromosphere. The longest treamer extended more than 150,000 ml above the edge of the sun.
- 3 Quasi-cruptive prominence of Aug. 24, 1939, photographed in the light of ionized caloium. The prominence was about 105,000 mi. high and extended about 155,000 mi. along the edge of the sun.
- 4. The same prominence as in (3), photographed the next day
- 5 Prominences of the sun observed May 26, 1916, at Srinagar, Kashmir, India
  - 6 Inner corona and prominence photographed during a total solar collipse, May 29, 1919, observed at Sobral, Brazil The red flame rose from a height of 130,000 mi to more than 500,000 mi above the surface of the sun in less than seven hours

The sun in total colipse at 9 a m. January 24, 1925, showing the long streamers of the Corona. From a photograph made from High Bridge Park, New York City, overlooking the Harlem River. Although the sun itself is hidden by

SUN

presed as the solar constant, which is defined as the amount of energy which would fall perpendicularly per square centimetre per minute on a surface placed just outside the earth's atmosphere. The value of this constant, according to Charles Greeley Abbot, is about 1 94 calones (81,000,000 ergs), but it is subject to slight variations which are related to the sunspot periodicity and possibly to other factors also. The rate of radiation appears to increase with the prevalence of sunspots, but further observations are recaused to determine the relation precisely

The question of the source and maintenance of this ceaseless efflux of energy will be dealt with in a later section of this article For the present we will limit ourselves to the consideration of the immediate use which can be made of the measurements in the light of ascertained physical principles It is known that surfaces in a certain condition-known as that of a berfect radiator or black body-when they radiate energy, do so at a rate strictly proportional to the fourth power of their absolute temperature The assumption that the sun radiates like a black body, though oversimplified, should give a fairly good approximation to the temperature Now the sun cannot be uniform in temperature throughout, so that it is necessary to consider what region has the temperature so determined Since the greatest part of the radiation is in the form of visible light, this region must be the photosphere, and the photosphere is a relatively thin superficial layer at the base of the atmosphere. Thus the temperature measured from the total radiation is that of the outside of the sun It is called the effective temperature, and has a value of 5.750 absolute centigrade degrees

The Sun's Analyzed Radiation -The bolometer also provides the data for another method of estimating the sun's effective temperature. The 1adiation from a black body is distributed among the various wave lengths in its continuous spectrum in a manner definitely related to the temperature of the body. Thus, if the bolometer be passed along the solar spectrum, and the amount of energy at each point in the continuous background thereby measured, the distribution of energy throughout the spectrum may be determined and the absolute temperature deduced. (Allowance must again be made for absorption by the earth's atmosphere, which is not uniform for all wave lengths ) There are two partially independent methods of analyzing the observations to obtain the temperature, which yield the respective values, 6,150° C. and 5,800°-6,300° C. If the sun behaved exactly as a perfect radiator, these determinations would agree with one another and with the result obtained from the undissected radiation. The slight departures from agreement show that the sun is not quite in this condition, but is sufficiently near to it to enable us to say with confidence that the temperature near its surface is about 6,000° C.

#### CONSTITUTION OF THE SUN

Modern View of the Sun's Constitution .- The chief facts concerning the sun which have so far been brought to light are now before us, and the question arises: What idea of the sun do they lead us to form? Following the independent investigations of Arthur Stanley Eddington and James Hopwood Jeans, we think of a vast concourse of broken fragments of atoms in violent movement, held together by gravitational attraction. An atom, it should be remarked, is now pictured as a sort of miniature solar system, in which a number of electrons, or units of negative electricity, revolve round a positive nucleus. The net amount of positive electricity in the nucleus is, in the normal atom, exactly equal to the sum of the negative charges constituting the revolving electrons, and one element is distinguished from another by the amount of this charge. Thus, the hydrogen atom consists of a nucleus with one unit of positive charge and a single satellite electron: the helium nucleus has two units of positive charge and two satellite electrons; and so on, up to uranium, the heaviest known element, which has 92 units of charge in the nucleus and 92 revolving electrons. By certain methods some of the electrons can be detached, one by one, from their orbits and set free. The remainder of the atom is then said to be ionized Atoms can thus be singly, doubly, and, in general, multiply ionized, according to the number of electrons which are so detached. In such states, however, they for fully 1,000,000,000 years.

are unstable and recapture electrons to make up their deficiency at the earliest opportunity

Positive nucles and electrons, then, are the material units of which the sun is believed to be composed Present knowledge of nuclear physics makes it very improbable that stable atoms of other kinds—which would necessarily be heavier than those known on earth—should be present in the sun 'The direct evidence of the spectroscope, of course, reveals the composition of the sun's atmosphere only. Since the sun is radading energy, contions of stability require that it shall get hotter towards the centre, so that the effective temperature of 6,000° C represents approximately the minimum solar temperature. Now from laboratory experiments and deductions therefrom, we know that high temperature is one of the agentischrough which atoms are ounzed the interfor of the sun must therefore be pictured as a swarming control of electrons and iomned another the control of electrons and of inset characteristics. He control is approached. Near the centre, in fact, the nuclea are almost, if not only its first satellite electrons.

In the ceaseless and inconceivably rapid motions electrons are captured by nuclei and set free again millions of times per second Both the cause and effect of this process is radiation. Every time an electron is captured the energy of its former motion is liberated as a unit beam, or quantum, of radiation; every time a quantum falls on an atom tuned to receive it a satellite electron absorbs its energy and flies into momentary freedom. Ionized atoms. electrons, and radiation thus take part in a process of continual interchange, rapid beyond conception and without pause or diminution of intensity. But there is an important difference in the behaviour of the atoms and electrons on one hand and the radiation on the other. The headlong careering of the former is kept within a limited range by the gravitational equilibrium of the whole mass, while electrostatic forces preserve a constant proportion between the number of nuclei and the number of electrons in each region Radiation, however, is not so controlled It works its way from the centre, where it is most intense, out to the surface and thence to space at the observed rate of 3 79×1033 ergs per second. The sun loses radiation at this enormous rate, and has been doing so for countless millions of years, while the electrons and atomic nuclei remain chained within its boundaries. How is it possible for the process of interchange to be maintained?

It has been realized for some years that the energy required to keep it going must anse from reactions involving the nuclei of atoms, which result in a diminution of their aggregate mass, and the liberation of the great amount of energy which, by the principles of relativity, corresponds to thus Great numbers of nuclear reactions have been produced in the laboratory by various means since about 1930; and among these a group has been found which suffices to account quantitatively, as well as qualitatively, for the sun's energy production.

The researches of Hans A. Bethe have revealed a complex cycle, involving reactions between nuclei of hydrogen, carbon and nitrogen, with the (net) result that hydrogen disappears, helium is formed, much energy is hberated, and the heavier nuclei are regenerated to act as catalysts again (and again). Every reaction nucleved in this process has been produced in the laboratory, the would combine into an automatic operation only at temperatures of the order of 2,000,000° C. This process probably maintains the radiation of the siars of the main 'sequence' (ree STELLA CONSTRUTION AND EVOLUTION').

The picture of the sun which we have so far drawn will fat almost any star, and indeed will be found with greater elaboration of detail in the article Star. We proceed to particularize for our own luminary. The calculations of G. Blanch, A. N. Lowan, R. E. Marshak and H. A. Bethe (which satisfy the physical requirements known in 1944). lead-to a central temperature of 26,000,000° C, a central density 110 times that of water, and a hydrogen abundance of 35% by weight. Other solutions, with kelium present and somewhat different internal temperatures, are possible. The transformation of 1% of the sun's mass from hydrogen into helium would supply energy enough to keep it shining each.

Application to Detailed Features -Such, in outline, is the idea which is now held of the sun's constitution. The concepts out of which it is formed are atomic nuclei, electrons and radiation If it were complete, the existence of sunspots, prominences and the corona, the sun's rotation, equatorial acceleration and magnetic field, and the phenomena of the atmosphere would follow as mevitable consequences They do not do so because we have either not yet specified sufficient fundamental concepts or failed to realize the full potentialities of those we have specified. Yet some progress has been made, especially in the consideration of the atmosphere, where, thanks largely to Megh Nad Saha, Ralph Howard Fowler, Edward Arthur Milne and Henry Norris Russell, ideas consistent with those applied to the interior have shown how the more prominent of the observed phenomena arise The atom of each element requires a certain amount of energy to detach each of its elections successively, and the conditions favouring detachment, or ionization, are high temperature and low pressure. Thus the specof its elections successively, and the conditions invouring unanament of ionization, are high temperature and low pressure. Thus the spectrum lines of sodium are produced only up to a certain height because, in the lower pressures above that height, all the atoms of sodium are ionized, in which state they produce different spectrum lines lying outside the range of wave length which the transparency of our atmosphere allows us to observe The precise connection between the ee of ionization and the physical conditions has been formulated, and this enables the temperature and pressure in the sun's atmosphere to be estimated from the observed heights reached by the various elements. It appears that the pressure in the sun's atmosphere is very low—less than one thousandth of that of the earth's atmosphere—while the temperature is not far below that of the photosphere. Whom wants the temperature is not in below that of the photosphere. When the temperature is not in below that of the photosphere when the theory of the throughpets are processed of the throughpets are processed of construction (see Censotwarman) papers in processes of construction (see Censotwarman) of the chromosphere is in processed of construction (see Censotwarman) of supports about the lines of the general solar theory, the work of Hale has greatly clarified our ideas of the nature of those objects. Hale pictures

Although there is at present no sign of an explanation of sunspots along the lines of the general solar theory, the work of Hale has greatly clarified our sciens of the nature of these objects. Ella pictures are considered to the solar present of the control of the solar particles produces a magnetic field. Photospheric matter is projected upwards along the axis of the vortex, becoming cool by sodden expansion and so appearing dather than the rest of the photosphere. This forms the umbra of a spot, and the outspreading and circulation of the material in the atmosphere constitutes the permuthra summing that during sesh 11-year cycle there exist, immediately beneath the photospheric two vortex rings, one in each hemsphere, each lying along a circle of latitude. When, at a certum point, a ring rises up to the photospheric and the strespected by it the two sections of the rotations and therefore opposite magnetic polarities. Periodic movements of the rings in latitude, occurring as part of a definite system of circulating currents of solar matter slightly below the photospheric elevel, account for the observed altitudinal magnation of the spots. This a very plausable hypothesis. It remains to be shown how such mag-have developed in a sun having the constitution described above.

in the construction of the state of the constitution the screen and constitution to be a state of the state o

SUNBIRD, the name of a group of small birds of about 104 species forming the passerine family Nectarinidae They live in the old world, chiefly the tropics; Africa is richest in species, then southern Asia and near-by islands, and one species reaches Australia. They are forest, brush and even garden haunting birds. The males of many species have brilliant colours; iridescent blues, purples and greens with patches of yellow, red and black are common. However, some species are dull coloured, as the females usually are. Sunbirds are characteristically flower birds, flitting about actively, perching among the blossoms and probing into the flowers for their food of small insects and nectar. For this they have long, slender, curved bills and extensible, more or less tubular tongues. The usual type of nest is an oval, pensile structure attached to a twig. The entrance is at the side near the top, over which a perchlike roof projects. The eggs are usually spotted and two in number. (A. L. Ro.)

SUN BITTERN, a bird, Eurypyga helias, of Central and South America placed in a family by itself, Eurypygidae. It is distantly related to such birds as the kagua of New Caledonia, rails

and cranes, and is grouped with them in the order Gruiformes. It is a slender bird about 17 in. long, somewhat raillike but with

full wings, a long, ample tail and a plumage variegated with browns, yellows, black and white It lives on the ground in wet forests and feeds on insects. Its display, involving spread wings and tail, is striking.

A L Rp.)

SUNBURY, a city of Pennsylvania, U.S., the county seat of Northumberland county; 40 mi (in an air line) N of Harrsburg, at the confluence of the west and the north branches of the Susquehanna iiver; served by the Pennsylvania, the Lackawanna and the Reading railways The population was 15,570 in 1950, and in 1940 it was 15,462. Sumbury is on the site of the old Indian village Shambolia. It is the site of historic Fort Augusta, pre-Revolutionary fort erected in 1756, where the power of the French was broken in the French and Indian War, a vital development in determining that the language and culture of the United States should be Englash rather than French.

Sunbury was surveyed in 1772 and was incorporated as a

borough in 1792
SUNBURY-ON-THAMES, an urban district in the Spelthorne parliamentary division of Middleses, Eng. 17 mi S.W. of
S. Paul's cathedral, London, by road. Pop. (1951) 23,356. Area
9 sq mi. It is a favourite riverside resort and residential district
which now includes Shepperton, Littleton, Charlton and parts of
Ashford common 'There are large buildings, pumping works and
filtration beds for the water supply of London, the installations
belong to the Metropolitan Water board 'The reservoirs at Littleton are very extensive. To the northeast is Kempton park, the
northeast of the state of the state of the state of the state of the parts
The park is famous for its race meetings, the principal fature being
the jubilee Handicap, established in 1887. There are locks on the
river at Sunbury and Shepperton, and at each place regultas are
held during the summer

SUN CHUANG-FANG (1885- ? ), one of the group of men who rose to prominence and obtained a brief tenue of power in China during the years of strife which succeeded the death of Yuan Shih-kai, Born in Lingcheng in the province of Shantung, he received military training at the Peryang college and in Japan In 1921 he obtained command of a division under Wu Pei-fu, and two years later he was appointed military governor of Chekiang. During 1924 and 1925 he extended his authority over Kiangsu and after defeating his northern rivals, announced the consolidation of five provinces, Kiangsu, Chekiang, Anhwei, Kiangsi and Fukien, into an independent state under himself as governor general. He was the ablest and the most enlightened of the tuchuns, travelling continually through his territory to see for himself that the people were fairly treated. He was on friendly terms with the foreign authorities of Shanghai, openly expressed shame at the backward state of Chinese cities and pleaded for foreign co-operation. In May 1927 he was swept aside in the advance of the Nationalist army from Canton to the Yangtze and fled to Peking. In 1928 he fought bravely but unsuccessfully at Hsuchowfu against Chiang Kai-shek's march on Peking. In 1933 he became a Buddhist monk Later it was widely reported that he had been assassinated by a woman whose father he had executed.

SUN COPYING or Photocopying, the name given that branch of photographic contact printing which is carried out without the aid of a camera-made negative.

(See Blue Print.)

SUN CURE; see Heliotherapy; Sunlight Treatment.

SUNDA ISLANDS, the collective name of the islands from the Malay peninsula to the Moluccas, including the Great Sunda Islands—i.e, Sumatra, Java, Borneo, Celebes, Banka and Billiton, and the Lesser Sunda Islands, Bali, Lombok, Sumbawa, Flores, Sumba and Timor, etc.

Sunda strait is the channel separating Sumatra from Java and uniting the Indian ocean with the Java sea. Its narrowest part, between the southeastern extremity of Sumatra and the

town of Anjer in Java, is 14 mi wide In the middle is the lowlying well-wooded island of Dwars-in-den-Weg ("right in the way"), otherwise Middle Island or Sungian, which divides the strait into two channels each about 4 mi wide. In 1883 Sunda strait was the scene of the eruption of Krakatoa (q.v.). The

Sunda group was occupied by Japan in 1942,

SUNDARBANS or SUNDERBUNDS, a tract of country in Bengal, India, forming the seaward fringe of the Gangetic delta It extends for about 170 m along the sea face of the Bay of Bengal, from the estuary of the Hooghly on the west to that of the Meghna on the east, and runs mland for a distance of 60 to 80 miles It is intersected from north to south by large tidal rivers or estuaries, which are connected by numerous interlacing channels. The whole tract is a network of estuaries, rivers and creeks, which enclose a large number of flat, marshy islands Many are covered with forest and a dense undergrowth standing m soft mud, half m and half out of the water The area under forest is about 3,000 sq miles The characteristic tree is the sundri (Herstiera littoralis), from which the name of the tract has probably been derived Along the sea face the forest is composed of mangrove, which in some places are separated from the sea by a line of sand dunes. Cultivation is confined to the north, where over 2,000 sq m. have been settled, but the population is very sparse South of the area of cultivation, the Sundarbans are practically ununhabited The chief wild animals are tigers, of which many are man-eaters, leopards, deer and wild pig; crocodile infest the estuaries

SUNDAY, the Lord's day in the Christian world, the first day of the week, and the day set apart for divine worship in Christendom, in memory of the Resurrection Early apostolic writings bear witness to the sanctity of the day dedicated to the duties laid down in the fourth commandment, the equivalent in the Christian religion of the Jewish Sabbath (Saturday). Eventually the Roman emperor Constantine enjoined Sunday rest from labour, except agricultural, by constitutions, the first of which was decreed in AD. 321, and most of which are contained in the

code of Justinian.

English Laws .- In the 7th century AD. the laws of Wihtred, king of Kent, provided that if a servant, contrary to his lord's command, did servile work between sunset on Saturday evening and sunset on Sunday evening, he should pay a fine to his lord: they forbade a servant to make a journey of his own on horseback on Sunday under penalty of a fine or the lash, and a freeman to work during the forbidden time, under certain penalties including the payment of half the fine to the informer, who also was entitled to the profits of the Sabbath-breaker's labour. On the other hand, Ina, king of Wessex, in the same century ordained that if a slave worked on Sunday by his lord's command he should become free, and the lord be liable to a fine of 20 shillings.

By a series of statutes, many of which are still the law of the country, it is illegal to work or to take part in certain forms of pastime on a Sunday, which in English law is reckoned from midnight to midnight The first such prohibition in a statute is in 28 Edw. III. c. 14 (repealed) by which in 1354 the sale of wool at the staple was forbidden on a Sunday. Although the church had sufficient temporal power to visit Sabbath-breakers with its displeasure, Sunday observance was not ordained by statute until the reign of Edward VI. by the Act of Uniformity of 1551. By I. Eliz. c. 2 (1558) everyone had to go to church on a Sunday or be liable not only to the censures of the church but to a fine of twelvepence. The penalty was not formally repealed until 1846 (9 and 10 Vict. c. 59). It is still the law of England that members of the Church of England are required to attend divine service on Sunday, and though in practice this law has not been enforced for generations, obedience to the law has been upheld by the High Court in the analogous case of Ascension Day as against a - later Act relating to compulsory education attendance (Marshall and Bell v. Graham, 1907, 2 K.B. 112).

By the Sunday Observance Act 1677 tradesmen, artificers, la-bourers "or other person whatsoever" are forbidden to carry on their ordinary businesses under penalty of a fine of 5s or two

some of the inconveniences in modern life caused by the 1677 Act, which however did permit the sale of milk before 9 AM. and after 4 PM., and of victuals in cook shops and fried fish shops (Bullen v Ward, 1905, 14 L J K B, 916) Other statutes followed but are all repealed Still law are the Acts of 1762 (2 Geo. III c 15 s. 7), allowing fish carriages to travel on Sunday in London and Westminster; 1827 (8 Geo. IV. c 75), repealing s. 2 of the Act of 1677 as far as regards Thames boatmen. The Bread Acts of 1822 (3 Geo IV. c. 106) allow bakers in London, and of 1836 (6 and 7 Will. IV c. 37) allow bakers out of London, to carry on their trade up to 1.30 P M Since an Act of 1871 (34 and 35 Vict. c. 87) no prosecution for penalties under the Act of 1677 can be instituted except with the consent in writing of the chief officer of a police district or the consent of two justices or a stipendiary magistrate. (Thorpe v Priestnall, 1897, 1, QB 19.)

Since 1871.—The result of the Act of 1871 has been in substance to make the Lord's Day Acts a dead letter as to Sunday trading. In London Sunday markets are usual in all the poorer districts, and shopkeepers and hawkers are allowed freely to ply their trades for the sale of eatables, temperance drinks and tobacco The Factory and Workshop Act (1901) forbids the employment of women, young persons or children on Sunday in

a factory or workshop (s 34).

The Shops Acts 1912-22, which regulate certain conditions of employment for shop assistants and ensure them a half-day holiday, tacitly imply that the x677 Act is still in general operation with regard to shops. The intention to exclude Sunday from the operation of the 1912 Act may be assumed from the power given by s. I to exclude shops of any specified class from the operation of a closing order which would be in conflict with the Sunday Observance Act.

Fishing is permissible on a Sunday, except that one may only fish for salmon with rod and line (Salmon Fishery Act 1861). By the Game Act 1831, it is a crime to take or kill game on a Sunday, but the prohibition does not apply to rabbits. The law with regard to Sunday entertainments and performances is based upon the Sunday Observance Act 1781 (21 Geo. III. c. 49) by which heavy pecuniary penalties were imposed upon anyone who promoted any public entertainment or debate to which people were admitted only by payment A bill to permit certain public entertainments on a Sunday was introduced in April, 1931.

Sunday is a dies non for the sitting of the courts or meetings of public bodies, though parliament has at times sat on a Sunday in national emergencies, and Saturday sittings of the House of Commons have been extended into the small hours of the Sabbath. Process may not be served nor persons arrested except in cases of treason, felony, or breach of the peace (1677 Act), but

a justice may issue an arrest or search warrant.

Contracts on a Sunday.—Though at common law a contract made on a Sunday is valid, the technical restrictions imposed by statute on Sunday labour, especially those contained in the Sunday Observance Act 1677, render most contracts made and completed on that day void or voidable (Smith v. Sparrow, 1827, 4 Bing. 84). But any contract in respect of labour, business, or work not done in the course of a man's ordinary calling is binding. A cheque drawn on a Sunday is binding on the drawer; in an action on a bill of exchange drawn on a Sunday the drawer was given judgment against the acceptor (Begbie v. Levy, 1830, I C. and J. 180). The position in regard to these matters has been clearly laid down by the Bills of Exchange Act.

Computation of Time.-Where any limit or period of time fixed in the High Court exceeds seven days the Sundays included in it (except in divorce proceedings) are counted in computing the time, provided that if the last day fall on a Sunday, the period must be computed so as to cover the next following working day. But where the period fixed is less than six days Sunday is not counted, so that five days from a Saturday would commence on the following Monday and end on the Friday,

In Scotland and the British dominions the laws as to Sunday have followed more or less the same course, except that native customs have been interfered with as little as possible and parhours in the stocks in default. Acts have been passed to obviate ticular Acts have been passed to meet special needs. (W. La).

United States.-In the United States Sunday legislation, beginning with an enactment of the Virginia colony in 1617, was quite general in colonial times, and Sunday laws of varying types have been passed by all the states Their general trend is to prohibit the carrying on of any business on Sunday that is neither necessary nor charitable in nature. In some states general provisions to this effect are in force, others prohibit the conduct of particular trades and occupations. Many states forbid Sunday sports, prohibiting games and theatrical performances from being conducted for profit. Violation of the Sunday laws entails three It subjects the violator to the criminal penalty prescribed by statute. It makes unenforceable contracts, including promissory notes, executed or to be performed on Sunday. In a few states, it subjects the violator to a civil disability, thus preventing a traveller on Sunday from recovering for a negligent injury done to him inasmuch as his own illegal act was a cause of the injury. The criminal enforcement of Sunday laws throughout the United States is notoriously lax. (I. M La)

SUNDAY SCHOOLS. Late in the 18th century the educational problems arising from the industrial revolution led to a new religious effort in the form of the Sunday school movement. Robert Rarkes established his first Sunday school in Gloucester, England, in 1780 The idea, however, did not originate with Raikes. Among earlier pioneers in this field were Joseph Alleme, the Puritan Father, who founded Sunday schools in England in the 17th century, and John Wesley, who held Sunday classes in Savannah, Georgia, in 1737. Yet, by reason of his achievements in organization, Raikes is justly regarded as the founder of the English Sunday school. In its early days the Sunday school was of especial educational value because of its combination of secular and religious instruction; sometimes sessions were held on Saturday, as well as Sunday. But with improved economic conditions and the establishment of day schools the Sunday schools became more restricted to religious instruction.

Early in the 19th century the Sunday school movement became firmly established in the United States, and expanded apidly oflowing the organization in 18-24 of the American Sunday School Union and again after the introduction in 1872 of the international uniform Sunday school lesson system From Great Britain and the United States, Sunday schools have spread widely in other parts of the world, although according to figures released by the World's Sunday School association in 1936, the U.S.A. contained more than half the world Sunday school membership of 38,000,000 The Methodist Episcopal church led all U.S. denominations with a Sunday school membership of 35,000,000

SUNDERLAND, CHARLES SPENCER, 320 EARL OF (c. 1674-1722), English statesman, was the second son fit and earl, but on the death of his elder brother Henry he became heir and in 1703 succeeded to the perage. He married in 1700 Anne Churchill, daughter of the famous duke of Mariborough.

Sunderland met George I in 1706 and when the elector became king he was made lord-lieutenant of Ireland. In August 1715, he joined the cabinet as lord keeper of the privy seal, and in March 1718, he became prime minister, but his connection, though slight, with the South Sea bubble led to his political ruin. In April 1721, he resigned his offices. He died April 193, 1722.

SUNDERLAND, ROBERT SPENCER, 200 EAU. or (1662-720). English politician, was the only son of Henry Spencer (1602-648), 1st earl of Sunderland In Feb. 1670, he nettered political life as secretary of state for the northern department. He voted for the exclusion of James, duke of Vork, from the throne, and made overtures to William, prince of Oratee, and consequently in 168t he lost both his secretaryship and his seat on the prity council. Early in 7683, however, through the influence of the duchess of Portsmouth, Sunderland returned his position of secretary, to which was soon added that of lord president of 1fth coincil. Blug although he had in 7687 openly empraced the Roman Catholic faith, he hesitated to approve the Regie acts of the King 2 devotes, and in Oct. 1688 he was dismissed. He took refuge in Holland, but, in 7691 he was permitted by refurit to Expland, and he declared himself a Protestpan and be-

gan to attend the sittings of parliament, He died Sept 28, 1702. SUNDERLAND, seaport, municipal, county and parliamentary borough, Durham, England, at the mouth of the river Wear, on the LNE. railway, 261 mi N from London. Pop. (1951) 181,515. The borough includes the township of Bishopwearmouth, which lies on the south bank of the river, and that of Monkwearmouth, situated on the north bank The borough has been considerably extended, its area being 10 8 sq mi and including the former urban district of Southwick The great castiron bridge which crossed the river with a single span of 236 ft at a height of 120 ft above water was replaced by a modern structure in 1929. The old bridge was opened in 1796 and widened under Robert Stephenson in 1858 The only ancient building is the church of St. Peter, Monkwearmouth, in which part belongs to the Saxon building attached to the monastery founded by Benedict Biscop in 674. The church of St. Michael, Bishopwearmouth, is on an ancient site, but was rebuilt in the 10th century. There are six parks (136 ac.) in the borough, a museum and art gallery

The prosperity of Sunderland rests on the coalifields of the neighbourhood, the enstence of which gave rise to an export trade in the reign of Henry VII For 5 ml. above its mouth the Wear resembles on a reduced scale the Typne in its lower course. The town has exported as much as 5,000,000 tons of coal and coke yearly, but the dependence upon the coal trade only aggravated the effects of the depression of the 1930s. The harbour of 125 ac is formed by two stone piers. The parliamentary borough returns two members

History.-The history of Sunderland is complicated by the name Wearmouth (Wiramuth, Wermuth) being applied impartially to the Monk's town on the north bank of the Wear, the Bishop's town on the south and the neighbouring port now known as Sunderland. In both Monk's and Bishop's Wearmouth the settlement was connected with the church. Benedict Biscop in 674 founded the Benedictine monastery of St. Peter on the north bank of the river. The abbey, where Bede was educated, was Walcher (1071-80) settled Aldwin and his companions there.

Bishop William of St. Calais (1081-96) transferred monks there from Durham, and Wearmouth became a cell of the larger house There seems no doubt that the borough, identical with that to which Bishop Hugh of le Puiset granted his charter, was in reality Sunderland, the name Wearmouth being used to cover Bishop's and Monk's Wearmouth and the modern Sunderland. The shipping trade of Bishop's Wearmouth showed a steady increase. In 1382 there was probably a dock here and from the 16th century, Bishop's Wearmouth seems to have been completely identified with Sunderland: in 1567 Wearmouth was one of the three ports in Durham where precautions were to be taken against pirates, while no mention is made of Sunderland. Monk's Wearmouth remained purely agricultural until 1775, when a shipbuilding yard was established and prospered to such an extent that by 1795 five similar yards were at work. Prosperity continued until the depression of the 1930s caused severe unemployment-41% of the insured population in 1934.

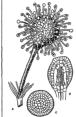

Sunderland was at farm in 783 and rendered 100 shillings and the town of Sunderland rendered 38 shillings tallage in 1179 turning the vacancy of the see, in 1138 Thomas Menvill held the borough, Edward IV in 1464, sede vacante, granted a lease of the borough, Edward IV in 1464, sede vacante, granted a lease of the borough, Edward IV in 1464, sede vacante, granted a lease of the borough from time immemorial, under the name of the New Borough of Wearmouth

SUNDEW, the popular name for plants of the genus Drossra, of which there are more than 90 species with world-wide distribution. There are four species in North America and three in Europe. The most extraordinary development of this genus is attained in Australia and South Africa, where, in addition to the low, soft, herbaceous plants found elsewhere, occur tall plants attaining a height of three feet with wirry stems which climb by the aid of certain of their addhesive leaf blades.

All species are carnivorous. They catch their prey by means of tentacles which spring in a regular pattern from the upper surface of the leaf blade. As many as 400 have been counted on a leaf of D. rotundifolia o 9 cm in diameter The tentacles ovate, compressed body-whence the popular name pumpkin seed stand distinctly separated They vary in size, shorter in the middle of the blade and much longer (o 6 cm ) along and near the margins In some species with linear leaves there is little or no difference in size Each tentacle consists of a stalk, broader at the base and tapering to the top, which supports an oval or nounded gland of rather complex structure The middle of this gland is occupied by a cylindrical mass of water vessels enclosed within a bell-shaped layer of flat cells. The cells which form the

edge of the bell extend to the outer surface of the gland Covering this bell are two courses of cells normally filled with red or purplish sap Each gland secretes and supports a droplet of mucilage, which, in multiple, renders the leaf very dewy in appearance, hence the common name The red point of colour shining through the clear mucilage presents an appearance of rare beauty, which appears to attract insects. Connecting the gland with the vascular tissues of the leaf is a strand of vascular tissue extending through the stalk and base to the veins of the blade.

The tentacles are capable of motion. Darwin was the first to make extensive experimental studies on the matter. When a small insect alights on the leaf, its escape is prevented by the mucilage, which smears and smothers sections of a GLAND FROM THE it during its struggles to escape

FROM LLOYD, "THE CARNIVOROUS PLANTS"

SUNDEW (DROSERA ROTUNDIFOLIA) A. LEAF, SHOWING GLANDS, B AND C. LONGITUDINAL AND TRANSVERSE TENTACLE

The presence of an insect affords a stimulus to neighbouring tentacles, which bend toward the prey and attach themselves to it by their mucilage, bringing a large contact surface to bear A digestive ferment is then secreted which attacks the nitrogenous content of the prey. The products of this digestion are then absorbed by the same glands. The movements of the tentacles are complex, but the net result is to bring the body of the prey toward the middle zone of the leaf blade, which itself can bend to surround the prey. There are also many minute sessile glands scattered over both leaf surfaces whose function is problematical The leaf blade may be nearly orbicular, or linear and rush-like (it is then nonmotile), with various intermediate forms. Some are peltate and circular, bowl-shaped or lunate, others variously ovate to large strap-shaped.

Reproduction takes place not only by seeds, but also by leaf buds which spring normally from the bases of the tentacles, more abundantly on leaves which have been detached. In one or two species, buds, in the form of gemmae, spring from the apex of the stem after the foliage leaves have been produced Some species produce "droppers," special branches with negative geotropism, which penetrate the substrate Their ends then enlarge into tubers, Closely related to Drosera are the genera Drosobhyllum and Byblis, both carnivorous, and Roridula (q.v.), once thought to be so. See C Darwin, Insectivorous Plants (1875); F E. Lloyd, The Carnivorous Plants (1942). (F. E. L.)

SUN-DIAL: see DIAL.

SUNDSVALL, a seaport of Sweden in the district (län) of Västernorrland, on a wide bay of the Baltic, at the north of the Selanger river, 360 mi. N. of Stockholm, the terminus of a branch from Ange on the Northern railway. Pop. (1943), 19,167. It was rebuilt in brick and stone after a fire in 1888.

SUNFISH, a name sometimes given to the Centrarchidae, a family of perch-like fishes inhabiting the fresh waters of North America, and especially to the common sunfish or pumpkin seed (Eupomotis gibbosus), abundant, especially in ponds, from Maine to Minnesota and southward near the Atlantic coast to Florida. This favourite of juvenile anglers has a strikingly coloured.

-which is sometimes 8 in, long, though usually smaller, greenish and bluish olive above, spotted with orange on the sides, and orange below. The female deposits her eggs in a nest scooped in the muddy bottom of shallow water by the male, who guards it until the young are hatched The name sunfish is applied also to the Molidae marine fishes of the order Plectognathi curious fishes appear tailless, the body ending abruptly behind the dorsal and anal fins, they have a small mouth, with a single sharp-edged tooth-plate in each 1aw. Mola include two species, large. stout, deep-bodied fishes with a rough skin, they are oceanic inhabiting warm seas, and may often be seen resting at the surface, they reach a length of 8 ft and a weight of perhaps two tons The oblong sunfish (Ranzama truncata) is longer and more compressed, smooth, with tessellated scutes; it reaches 2 feet.

SUNFLOWER. The common sunflower, Helianthus annuus, a member of the family Compositae, is a native of the Great Plains region of the USA It is an annual herb with a rough hairy stem 3 to 15 ft. high, broad coarsely toothed rough leaves 3 to 12 in long, and heads of flowers 3 to 6 in. wide in wild specimens and often I ft or more in cultivated. Double forms are in cultivation, one (globosus fistulosus) having very large globular heads. The plant is valuable from an economic as well as from an ornamental point of view The leaves are used as fodder, the flowers yield a vellow dve and the seeds contain oil and are used for food. It is cultivated in the U.S.R., England and other parts of Europe, in Egypt and in India for the seeds. the vellow sweet oil obtained by compression being considered about equal to olive or almond oil for table use. Sunflower oilcake is used for stock and poultry feeding, and is ordinarily exported from the USSR, to Denmark, Sweden and elsewhere The genus Helianthus contains about 60 species, chiefly natives of North America, a few being found in Peru and Chile. They are tall, hardy annual or perennial herbs, several of which are of easy cultivation in gardens with moderately good soil H decapetalus is a perennial about 5 ft. high with solitary heads about 2 in across in slender twiggy branchlets; H. multiflorus is a beautiful species with several handsome double varieties, H orygalis is a graceful perennial 6 to 10 ft high, with drooping willow-like leaves and numerous comparatively small yellow flowerheads. H atrorubens is a smaller plant, 2 to 5 ft. high, the flower heads of which have a dark red or purple disk and yellow rays. There are many fine forms of this, some of which grow 6 to 9 ft high and have much larger and finer flowers than the type. Other fine species are H giganteus, 10 to 12 ft.; and H. mollis, 3 to 5 ft H, tuberosus is the Jerusalem artichoke.

SUNG DYNASTIES: see China: History; Chinese PAINTING; CHINESE SCULPTURE.

SUNIUM, a cape at the S extremity of Attica, with a temple of Poseidon as landmark for ships, the modern Cape Colonna. The rocky promontory was fortified by wall and towers, in 413 BC., against the Spartans in Decelea; but was soon after seized by fugitive slaves from the Laurium mines. In the 4th century it was still a fortress. The temple, probably built in the time of Pericles, in the place of an earlier one, similar but of tufa or 'poros" stone, is shown by an inscription to be dedicated to Poseidon, not, as formerly supposed, to Athena, whose temple, of peculiar plan, with colonnade on two sides only, lies about a quarter of a mile away to the N E. Of Poseidon's temple there are still standing nine columns of the S. side, two of the peristyle on the N., one of the antae and an inner column of the brongos, of local white marble, which has suffered from the weather,

SUNLIGHT TREATMENT. (See also Heliotherapy: VITAMINS.) In countries where, relatively, there is much persistent cloud, in extreme northern or southern lands where night is long in winter, on the sunless slopes of mountains or in sunless valleys, in factory towns where smoke defiles the atmosphere with its soot particles, in slums where the houses are crowded together and men, women and children are herded in dark damp rooms with vitiated air, it is found that resistance to infective disease is low, rheumatism and tuberculosis are rife, expectation of life is below normal, infant mortality is high. To these conditions, no doubt, many causes contribute; but it is generally believed a deficiency of sunlight is a powerful factor. The tendency at the present day regarding the attributes of the sun's rays is to lay much stiess upon the invisible ultra-violet rays of the solar spectrum as well as upon the invisible infra-ed and the visible rays.

Treatment by Direct Sunlight,-This is difficult or impossible under such conditions as have been mentioned above; some methods of supplying it are by the provision of open spaces and playing fields in the neighbourhood of crowded areas, establishment of open-air schools, cult of outdoor sports, etc. But even if sunlight be available, the atmospheric conditions may permit of little penetration by the ultra-violet rays Hence, methods have been adopted to supply these from abundant supplies such as the electric arc and the mercury-vapour quartz lamp, and to minimize screening effects by the use in buildings of such material as glass made of quartz which admits a maximum of ultra-violet and other beneficial rays, by the use of lighter and more porous clothing, or even by exposure of much of the body Thus in one way or another, whether as a curative or preventive measure against disease, there is a great movement towards supplying, naturally or artificially, that sunlight which is deficient. As a preventive measure the use of sunlight is modern, but the curative side has been recognized for centuries, having been used by the Chinese, Egyptians and the South American Indians and is represented by the numelous health spas and resorts throughout the world.

Mode of Action of Direct Sunlight .- The rays of sunlight, when analyzed by the prism, range between the infra-red (heat) rays of relatively long wave-length and slow frequency to the ultra-violet (chemical) rays of shorter wave-length and greater frequency. Within this range the penetrating power of the infrared and of ultra-violet rays into human tissues is definitely less than that of the visible rays. Hence heat from the visible rays of sunlight passes through the skin and, largely, is taken up by the blood and distributed by way of the circulation throughout the body; infra-red heat rays warm the superficial layers of the skin and from them heat is carried to other parts. Ultra-violet light produces its effects in the skin itself and its action is manifested by the inflammation, peeling and tanning that exposure to the sun occasions in most persons. The pigment of coloured races prevents the penetration of ultra-violet rays deeper than the pigment layer and thus is a protection in tropical countries

Warmth.—The increased warmth, when moderate, stimulates metabolism, induces a sense of well-being, increased appetite and mentals activity; when greater, as in the height of summer or m the tropics, leads to sweating, desire for cool drinks and cool breezes and disfinitiantion for food, particularly sugars and fast, since moderate of which supplies a large proportion of animal heat; and when excessive it leads to the pathological condition of sunstrole or heatstroke (see SUNSTROKE AND HEATSTROKE).

Ultra-violet Rays .- But the ultra-violet rays are now known to have special qualities. For long it has been known that the skin has the property of regulating heat loss and so contributing towards maintenance of a stable body temperature in warmblooded animals. Recently it has been shown experimentally that even a short exposure to ultra-violet radiation modifies the bactericidal power of the blood and its leucocytic content. Moreover, the discovery that vitamin D (see VITAMINS) can be produced in ergosterol-an impurity ant to be present in all cholesterols but found originally in ergot of rye  $(q v_{\cdot})$ —has indicated a variety of action of which the full importance is, probably, still unknown. In investigations on rickets (q.v) it was found that cod-liver oil is beneficial; later, that ultra-violet irradiation is beneficial, even in the absence of cod-liver oil, and ultimately that ultra-violet rays act on the non-saponifiable part of a natural fat, i.e., the sterol, and produces vitamin D. From this it appears that the ultraviolet rays of summer sunlight act upon the ergosterol impurity in the cholesterols present in all animal cells and build up a store of vitamin D for our use during the winter when the ultra-violet radiation of sunlight is deficient

The fact that ergosterol when exposed to ultra-violet radiation produces vitamin D has been turned to practical and commercial account. Under the rays ergosterol changes from a white crystal-

Ine sold to a pale yellowish oily find which possesses the highest voltame D potency known Thus artificially produced, there are be supplied to footsuffs ( $e_F$ , milk, butter, marganne) in their preparation an element deficient when produced in winter burnormally present in sufficient quantity when produced in summer Under natural conditions we ast foods containing ergosterol and this is acted upon in our bodies by the ultra-violet radiation reaching our skin,  $\sigma(e_F$ , in the consumption of New Zealand butter) we incorporate during the relatively sunless period in England vitamin D formed in the New Zealand sump period

Experiments and Theories .- The subject is a very complicated one but there is no doubt that the mortality from many diseases normally reaches its highest point in England in the winter months of January, February and March. Confidence in the therapeutic value of sunlight is strengthened by the beneficial results accruing in the monkey-house of the Zoological gardens, London. where electric lamps of fused quartz have been installed to allow of the passage of ultra-violet rays to the animals It must be noted, however, that this artificial sunlight must be used with great caution and for short periods as otherwise it has proved harmful, Indeed there is reason to believe that while a moderate exposure to ultra-violet radiation builds up vitamin D, an excessive exposure destroys it The output of ultra-violet radiation from an electric system, though dependent upon the current and voltage between the poles of the arc, varies widely according to the type of electrode used. A positive carbon electrode with an iron core, disposed below the negative plain carbon electrode, instead of above, is a powerful source of ultra-violet radiation

Lastly, menton must be made of Dr. Rollner of Leysm, Switzerland, and of Sr Henry Gauvan of the Treloar hospital for cripples at Alton, Hants, England, pioneers in the modern sunlight treatment of disease and of a remarkable journalists success in the Swinght and Health Supplement to The Times newspaper issued in London on May 22, 1928, to which the writer of this article is much indebted.

SUNN or INDIA HEMP (also termed Bombay hemp, Jubblepore hemp and Benares hemp). The plant (Crotalaria juncea) is an annual of the Leguminosae family and is propagated by seed. It is in no wise related to "true" hemp (Cannabis satisfied). Other native names include "San," "Sann" and "Saan" India is the only country in which there is any extensive production of Sunn fibre. The crop is used widely there for green manuring as well as for fibre. When grown as a summer crop the seed is planted in May or June; as a winter crop it is seeded in October The seed is broadcasted at 70-80 lb an acre. On suitable soils the plants grow 5-10 ft. high and mature in from 120 to 150 days. The bright yellow flowers are self-sterile and are crosspollmated by insects. Harvesting is done between the full blossom stage and the mature seed stage. The plants are usually pulled but sometimes cut with a hand sickle. The fibre occurs in the outer tissues of the mature stalks (pericycle and phloem) and cannot be satisfactorily separated from the other plant tissues until the stalks are partially decomposed by water retting (rotting). Because good retting is very difficult to obtain, much Sunn fibre is poorly cleaned and improperly prepared for spinning. Yields of fibre vary greatly, but average crops produce from 500 to 600 lb, an acre. The area harvested for fibre in India during the period of 1920 to 1940 was estimated as 500,000-700,000 ac. annually, an indicated average yearly production of around 165,-000 tons of fibre. Nearly all of that exported went to the United Kingdom and the United States. Sunn fibre is used for making practically every kind of cordage-ranging from coarse ropes to fine twines. One of its best known uses in the United States is for making oakum for calking and packing

SUNNIS (SUNNITES): see ISLAM.

SUNSHINE, the sun's light; the direct rays neither scattered nor reflected; hence the warmth and light given by the sun's rays Sunshine includes not only the visible portion of radiation from the sun, but also invisible ultra-violet and infra-rerays Radiation from the sun is the ultimate source of all except a practically negligible portion of the supply of energy that is essential for the maintenance of nearly all plant and animal life on the earth and the operation of nearly all ratural phenomena on the surface of the earth. In patietizin, the amount and distribution in time and space of the solar radiation which is intercepted by the earth are the prime generating causes of the physical activities the surface of the contract o

The rate at which sunshine is received on a hornoutal surface depends upon (i) the solar constant, or the emanation from the sun, (2) distince from the sun, (3) the inclination of the incident rays to the hornoutal, as determined by lattice, time of year and time of day, and (4) depletion to which the tadiation has been subjected during passage through the atmosphere As sunshine passes through the atmosphere, it is in general divided into three parts, (1) one part, almost unchanged in wave length, is turned aside from the direct beam and scattered in practically all directions, (2) another part is shorhoed, i.e., changed almost entirely into heat energy; (3) the remainder is propagated unchanged in wave length.

Measurement of Sunshine.—Several types of devices are used to record sunshine, few give highly accurate indications of sunshine according to the true definition. Instruments which purportedly measure the direct rays of the sun fail with faint sunshine, while others are affected by diffuse, or indirect sunshine

The Campbell-Stokes sunahine recorder consists essentially of a segment of a spherical netal bowl, having a glass sphere placed concentrically within it and centred so that the sun's rays are focussed on a card lining the bowl. Diffuse light does not record; direct sunahine burns a spot or a line on the card. Differentiation between a record of a few seconds and a mitute of intense sunlight is difficult because the two traces are similar. Also, when the sun is barely visible through snoke or thin clouds, its rays are too weak to record. The Campbell-Stokes is used chiefly by the Brutsh and a few other European countries.

Modified forms of sunshine recorders use blue-print paper mounted on a cylinder The Jordon type contains two semicylinders with narrow sitis in their narrow sides and, like the Campbell-Stokes recorder, maintains its own time-record

The Marvin sunshine recorder is an air-thermometer in which an electrical circuit is closed through the expansion of mercury

FIG. 1 -- CAMPBELL-STOKES SUN-SHINE RECORDER

by the main action of the sun. The duration of sunshine genesally is recorded on a triple register which also indicates the direction and velocity of the wind and the amount of precipitation. The adjustment of this instrument is so critical that frequent errors arise from imperfect setting. Not only are corrections necessary to allow for failure of contact with low sun, but also in many instances diffuse light from the sky is sufficient to expand the mercury when the sun's disk, is not visible.

At best, all of the types of instruments so far mentioned merely indicate when the sun does or does not shine and none sives quantitative results.

The Eppley 180° syrletioneter, which accurately responds to nearly all the radation which reaches the surface of the earth on a horizontal surface, gives quantitative results. This instrument consists of two concentric rugs of equal area, one black-ened and the other white-coated. The hor junctions of a multiple thermopile of gold-vallatium and platuman-hodum alloys are attached to the lower side of the black ring, and the cold junctions are fastened to the lower side of the white ring. The differential in temperature between the two rings when radiation falls upon, them creates an electromotive force that is nearly proportional to the amount of radiation received. The rings are

rays Radiation from the sun is the ultimate source of all except
a practically negligible portion of the supply of energy that is which is sealed to prevent deterioration of the receiving surfaces essential for the maintenance of nearly all plant and animal life and also to prevent mosture from condensity them. The election the earth and the operation of nearly all natural phenomena tomotive force generated by the receiver is recorded on a

RECORDER

potentiometer and reduced to values in gram-calones per minute per square centimetre

Receiving surfaces of instruments for measuring direct sunsine are mounted at the lower end of a disphragmed tube Thermoples offer ease of recording for total solar energy, photoelectric cells are useful for measuring limited components of radiation. More accurate determinations of the visible portion of sunshine are made by means of photometers, or instruments by which the brightness of sun-

light is matched against a known artificial light-source. Quality of Sunshine.—The major portion of sunshine which penetrates through the atmosphere ranges in wave-length from o  $s\mu$  (so coop mm) to  $s\mu$ . Qu. Ordinarily, sunshine is broked down into three major components: (1) the visible, or that part between  $c_{A\mu}$  and  $c_{B\mu}$  (one octave of wave length), (2) the between  $c_{A\mu}$  and  $c_{B\mu}$  (one octave of wave length), (3) the and (3) the infra-red with wave length shorter than  $c_{A\mu}$  and (3) the infra-red with wave lengths (longer than  $c_{B\mu}$ ).

Owing to a continual shift in the position of the maximum of the solar energy curve, no one factor can be used accurately to convert values in gram-calones to values in foot-candles. However, the value of 6,500 foot-candles per gram-calorie suffices for most practical purposes.

Visible Radiation—Visible radiation is commonly termed light; however, the word light too has a breader meaning and includes the ultra-violet, or that invisible portion immediately adjoining the shortest wave length of visible radiation. The visible portion comprises nearly one-half of the total radiation received at the surface of the earth. While most persons can discriminate between colours in the solar spectrum, the majority of males can detect red light of longer wave lengths than can females, while the latter as a rule can detect blue light of wave lengths shorter than can males. The yellow liquid within the iris acts as a filter which cuts off much of the ultra-violet light in 1945 it was accidentally discovered that when the eyebalis drained of its liquid, the subject can see ultra-violet light never before visually detected by man.

Sunlight is essential for the manufacture of carbohydrates from carbon dioxide and water; the first visible products of photosynthesis are starches, sugars and oils.

Ultra-violet Radation—While ultra-violet light comprises only a very small proportion of the total radiation, this component is extremely important. It produces vitamm D through the activation of ercosterol. It also is an important germicidal agent.

Unfortunately, the contaminated atmosphere over large cities robs radiation of practically all the shorter wave lengths, which explains why there is such a high incidence of rickets in tenement areas. On the other hand, vitamin D is harmful when the to excess, whether through natural sunshine or through the use of chemicals

Ultra-violet and the near ultra-violet rays comprise the socalled actinic rays which are very potent in effecting chemical changes on photographic films. Many photographic emulsions available in 1704 are sensitive to practically all wave lengths in sunshine and also to wave lengths at both ends of the solar spectrum.

Instructed radiation has its chief merit in its heat-producing quality. Close to one-half of total solar radiation received at the surface of the earth is infra-red. The spectrobolometer is the most important instrument for measuring small components of smilight. Solar rays of different wave lengths are refracted on entering and emerging from a prism, the shorter wave lengths being refracted more than the infra-red rays. It was through the use of the spectroscope and matched absorption-bands that knowledge of the composition of the sum was determined.

Exposure.—The ideal exposure of a sunshine receiver with a free horizon is not always possible, particularly in hilly or mountainous country. The shading is especially large in valleys between mountain ranges running in a N.-S. direction. Southern sloves are the most favourable for arriculture.

Sunshine is not the only determining meteorological factor to be considered when selecting a pleasant climate; temperature, wind and humidity also are important. The sun shines more than 90% of daylight hours in northeastern Sahara desert; yet few consider this an ideal climate.

The British Isles.—Sunshine is, however, one of the most important meteorological elements in the compact British Isles, which accounts for a wider distribution of sunshine recorders there than in any other area of equal size.

there than in any other area of equal size.

The average weekly distribution of sunshine in different sections of Great Britain based on 25 years of record is shown in fig. 3. Throughout the Isles the maximum sunshine occurs in early summer with a minimum amount in early winter. Longer summer days in south Britain account for the larger number of hours of sunshine in that section. Conversely, shorter winter days in north Britain result in the smaller number of hours of sunshine in that section.

Central Spainer of the application of smalline over other parts of the world. Central Spainer of the application of the small smalline than the reminder of Europe. Portions of the Salar desert have more sunshine than iny other part of the world, the eastern section averaging more than 95% in summer and 95% in white. The average sunshine along the equator in Alfaca is slightly more than 55% of the possible Allaska, the Aleuthan Islands and the Hudson bay region have comparatively little sunshine, especially in winter.

In general, the number of hours of bright sunshine increases from the poles, where it is less than one-third of the possible, to the zone between latitudes 30° N and 35° N where it ranges from 50% to between latitudes 30° N and 35° N where it langes from 50/6 or Coastal areas, as a rule, and with Australia a notable exception, have more sunshine than inland areas Sunshine ordinarily is less over hilly and mountainous country

The charts on figs 4 and 5 show the percentage of possible sunshine for the entire United States during June and December, respectively Table I gives the monthly and annual percentages of sunshine in the United States and in the vicinity of the Mediteiranean sea. Table II gives the monthly averages of solar and sky radiation in the United States and Alaska (I F H )

SUNSTONE, a variety of the mineral feldspar (q v ) exhibiting a brilliant spangled appearance in certain directions, caused by minute scales of iron oxide arranged parallel to a cleavage. It is somewhat similar to aventurine The best-known locality is in Tvedestrand, Norway It is also found near Lake Baikal, Siberia, and at several localities in the U S, especially at Middletown, Pa., and Statesville, N C

SUNSTROKE AND HEATSTROKE are terms applied to the ill effects produced upon the central nervous system and thereby upon other organs of the body by exposure to the sun or to any environment which raises the body temperature to haimful degree They are most frequently seen in the tropics but also in temperate climates during prolonged hot weather No race or oc-

cupation shows any peculiar susceptibility Heatstroke depends principally upon failure of the normal cooling mechanism of the body, te, evaporation of sweat from skin and body water from the lungs. Any situation such as great environmental humidity, ill-suited clothing or disease that impairs circulation and respiration predisposes to heatstroke. Acute and chronic alcoholism, high blood pressure, arteriosclerosis and chronic kidney disease are common predisposing causes. Overwork, anxiety, loss of sleep and prolonged hot weather are factors that increase body heat production and also exhaust the cooling mechanism

Cessation of sweating is always present at the onset of heatstroke, which may be abrupt or follow mild discomfort such as giddiness, slight would have been accounted to the control and the point as a summary of a control and the contr but always there are changes in the biain and numerous organs

If treatment is applied promptly and properly, many survive; but there is a degree of fever and a duration which causes lasting brain injury even though cooling was done After cooling, victims but there is a degree of fever and a duration which causes lasting brain fijury even though cooling was done. After cooling, victims may be unconscous for several days and fail rather than a couse in spate of good medical care. Severe cases that recover frequently have head-aches and other vague discomforts, especially on re-exposure to heat.

ones consistent state in sector, the work had of the Solinlet Was Becks-saily reduced to prevent heatstroke

Treatment—Quick energetic cooling is best, because inversible brain damage may occur otherwise Hospitals preparing for heatstroke epidemics have tub baths of cold (preferably ice) water ready. Brisk rubbing of the skin and massage of soft tissues disspates the body heat rubung of the star and massage of soft closues classpates the booty next into the cold water. When the retail temperature is between 102° and 100° F, energetic cooling should stop. If ice water baths are unavailable, brisk familing of the wetted skin is useful. Also, to lay the naked patient on the cool ground meanwhile is better than a warm bed. Skillul medical care is needed for occasional profounged unconsciousness or heart.

patient on the too groups assessment of the contract of the co

SUN YAT-SEN (1866-1925), Chinese republican leader, known in China by the more familiar title of Sun Wen, may truly be described as the father of the Chinese republic. His father, a poor farmer living at Hsiang Shan near Macao, was a convert to Christianity (under the London Missionary society) and his son continued to describe himself as a Christian till his death, before which he gave instructions that he should be buried with Christian rites

As a boy Sun was educated at Honolulu under the care of an elder brother In 1801 he entered the newly formed medical school in Hong Kong and graduated in 1894. It was there that his lifelong friendship with Sir James Cantlie began From boyhood his mind had been revolutionary Through a Chinese fellow student, Sun came into association with a secret revolutionary society and was conspicuous in a revolutionary plot after China's defeat by Japan in 1895, he escaped, though the other conspirators were executed Then during a long period he worked outside China to bring about a revolution. In 1898 he adopted the three fundamental principles of Nationalism, Democracy and Socialism, afterward glorified by the Kuomintang (the republican party he founded) as the Three Principles of the People Sun attempted to use the reaction after the Boxer outbreak of 1900 as a means of establishing a democratic government and ending the Manchu regime, but this attempt, like others, proved abortive. In 1905 the Chinese Revolutionary league was formed in Europe and Japan, and through this Sun raised large sums of money from overseas Chinese to spread his ideas through secret agencies in China A price of £100,000 was placed upon his head, and in 1896 he was kidnapped while in London and held at the Chinese legation for several days His release came about through a note to Sir James Cantlie which was smuggled out of the legation

Only Sun's personal influence and the efficient organization of the Kuomintang was able to turn the anti-Manchu tide into a prorepublican movement. Sun was in England when the revolution began on Oct. 10, 1911 He returned to China and on Jan. 5, 1912, he took the oath of office as provisional president of the new republic, at the request of the national convention in Nanking On Feb. 12 an imperial edict announced the abdication of the emperor and the substitution of republican for monarchical government The former vicerov Yuan Shih-kai was entrusted with the task of carrying through the changes involved, and Sun, realizing the impossibility of uniting the country under his own presidency, 1esigned his presidency in favour of Yuan. He accepted the post of director general of transport and trade, but was always more of the propagandist and inspirer than the practical administrator.

It soon became plain that Yuan had no thought of establishing a republic. This led, in 1913, to the second revolution, which Yuan easily crushed, and Sun fled to Japan. In 1917, after Yuan's failure to make himself emperor and after his death. Sun put himself at the head of a movement for an independent republic of south China The strength of his support had always been drawn from Kwangtung province, but he soon found it impossible to co-operate with the military leaders in Canton. He therefore resigned from his position as president of the republic of south China. The military regime was maintained largely by Kwangsi troops until 1921 when Gen Chen Chiung-ming drove them out and called in Sun

The following year he determined on an advance in force against the north, while Chen desired to consolidate the work begun in the province of Kwangtung. This led to an open breach, and Sun was once more driven from his native province, finding refuge in Shanghai. In Feb 1923 he called to his aid troops from Kwangsi and Yunnan and thus defeated his one-time colleague and subsequent rival, General Chen. From that time until his death he was acknowledged as the chief executive of the province, but his effective sway did not extend far beyond Canton. He used and permitted violent methods, more particularly in the attack upon the Merchants Volunteer corps and the looting and burning of a considerable part of the city of Canton in March 1924. In this way he lost much of the support which had been given to him and to the Kuomintang by the Chinese overseas. But his Socialist views ensured him the support of the mass of the workers, and he re-

peatedly secured riscs in wages for the Canton workers He was also still idolized by the student class and in his own party, where his was a name to conjure with

In 1923 Sun, having failed of other support against the north, turned to Moscow, which sent him an extraordinarily capable agent, Michael Borodin, and the equally capable General Galens to reorganize the nationalist troops. Borodin not only gave to the somewhat incoherent Kuomintang an efficient organization but succeeded in getting it to admit to its membership the Communist party, which by 1927, when Gen Chiang Kai-shek broke with it and expelled Borodin from China, had gained almost complete domination of the nationalist movement. Early in 1925 Sun went to Peking with some hope of peace and a new regime, to be formed with northern leaders then in power with whom he was friendly, but he died of cancer on March 12 He was buried in a mausoleum at Nanking in 1929 Sun was twice married. His first wife. mother of Sun Fo, who later attained eminence in the Kuomintang as a sort of elder statesman, he divorced in 1015 to marry Chingling Soong, sister-in-law of Chiang Kai-shek Mme. Sun was from Oct. 1949 a vice-chairman of the Central People's (Communist) Government council

SUPERANDUATION. The custom of providing pensions

for aged employees who, after mentorious service, are no longer able to discharge their duties efficiently became increasingly common after the middle of the 19th century The problem of mitigating the hardships of old age has been attacked from many angles and a great variety of solutions has been tried In England superannuation schemes for discharged seamen and soldiers date back to the middle ages, these were followed by systems applicable to civil servants and other public officials, and the custom of making some kind of provision for old age gradually spread to the employers of labour on a large scale and even to businesses with relatively small staffs. The question has also received attention on national lines, this aspect of the subject is treated under Pensions and Social Security, the present article being limited to the exammation of superannuation schemes in which the title to benefits has its roots in service given to a particular employer during the pensioner's working life

At the outset the granting of a pension is often merely an eleemosynary act dictated by the employer's wish to reward meritorious service or to safeguard an old servant from penury in his declining years. Later, the occasional grant in these circumstances having become a custom, superannuation allowances come to be looked upon as a right by the staff and regarded by the employer as an important element in the maintenance of an efficient personnel. In such a case a definite scheme prescribing the ages between which retirement shall normally occur (generally between 60 and 65), laying down scales and conditions of benefit (including the grant of pensions on retirement before the normal age on breakdown in health) and defining the class of persons to be included is soon recognized to be essential. The need for sound financial principles was not realized so soon. In the early days of pensions schemes, the expenditure on pensions, being almost negligible in the early years, was often charged to current revenue, and until this burden became heavy as the numbers on the pension roll grew, causing expenditure to increase rapidly, the need for making provision for accruing liabilities was not appreciated. Generally speaking, prudential considerations dictate that appropriate sums should be set aside and accumulated at compound interest throughout a person's service, while the liability for superannuation is accruing, in order that when he retires the sum in hand shall be sufficient to provide for his superannuation allowances By this method, as full provision is made before the pension commences, the burden of superannuation is met pari passu with payments of salary during service.

The accumulation of the appropriate reserves can be effected either in a privately managed superannuation fund or by an assurance company on behalf of the managers of the scheme. Under the former arrangement it is usual to institute a trust fund definitely the equivalent of his own contributions increased proportionately alienated from the ordinary business transactions of the employer In Great Britain such funds enjoyed certain privileges after 1021 in regard to income tax upon their interest income, provided that the main benefit took the form of a pension and not a lump sum Relief from tax was allowed also in respect of contributions whether paid by the employer or employee to a superannuation scheme Similar concessions were granted in the United States

Provident Funds .- The simplest form of superannuation scheme is a fund supported by periodical contributions (of fixed amount or varying with salary) generally paid in equal shares by the employer and the staff On retirement the employee is entitled to withdraw the contributions paid by himself and on his behalf by his employer, with their accumulations of interest

Superannuation Pensions Schemes,-The superannuation schemes which definitely provide for pensions are, however, gencrally considered to be more appropriate to the requirements of both the employer and the staff than the simple system described above The pension may be of fixed amount or may vary with length of service; in the latter case the amount of pension may be uniform for each year of service or may be related to the salary or wage earned by the employee during the whole or last few years of service Systems under which the pension depends both on the duration of service and also on salary are particularly appropriate to the differing circumstances of a salaried staff consisting of many grades. There are, however, many schemes in which fixed pensions or pensions which grow by uniform increments for each year of service have been adopted, eg, where a scheme is limited to man-

In systems based on salary it is common practice to express the pension as a specified proportion (e.g., one-sixtieth) of pensionable salary for each year of service, subject to a maximum (e.g., fortysixtieths). There are numerous methods of defining pensionable salary, one being the terminal salary (16., that earned in the last year before retirement) but, in order to avoid fortuitous inequalities of treatment, the average of the last few years of service is more usual Another plan often adopted is to take the average salary throughout service. Where the employee contributes a fixed percentage of his salary throughout his service, and the employer makes annual payments equal to the aggregate contributions made by his staff, it has been argued that from the standpoint of equity the resulting pension should be related to the contributions which have been paid by, or on behalf of, the beneficiary and that accordingly the average salary method should be adopted. But a practical objection to this is that the pension based on average salary is likely to be insufficient to enable a senior officer to maintain a reasonable standard of comfort after retirement unless the scale is fixed so high as to be overgenerous to the lower-paid ranks. In this connection it has to be remembered that while all new entrants, with trifling exceptions, start in junior grades entitled to low salaries, their progress varies widely. Judged on the principle that an employee, retiring after long service, ought to be able to maintain approximately the style of living to which he has been accustomed, anomalies appear inevitable under the average salary system, and for this reason the terminal salary system has become increasingly popular. With regard to the contention that the average salary system is fairer to the lower-paid grades, it may be said that, as one of the main objects of an employer is to secure efficiency, his contributions may fairly be allocated in the best way to achieve this purpose, and it is generally agreed that since even under the terminal salary method the employee, whatever his rank, receives at least full value for his own contributions and some part of the employer's subvention, the unequal distribution of the latter is not a valid criticism of the fairness of the scheme viewed as a whole. In periods of inflation, however, and general raising of salary levels, the terminal salary method results in higher pensions than were provided for in the financial basis of the scheme and large deficiencies may arise. The method therefore is suitable mainly in cases where the employer is prepared to guarantee the solvency of the fund.

out of the employer's grant, but if exact equivalence is desired the scheme has to be framed on other lines In such a case each contribution secures a definite amount of deferred pension, varying with the amount of the contribution, the age of the employee and the age at which the pension is to commence. On retirement instalments of pension purchased throughout service are aggregated. The system, generally known as the "money purchase" plan, is easy to work and is often adopted, especially in the United States and where it is found convenient to remaine the liabilities for pension with an assurance company in heu of instituting a private superannuation fund

Other Benefits and Developments.-The original object of a pension scheme was limited to the provision of an income in retirement whether because of age or ill health. Other forms of benefit were discouraged except that it was customary in contributory schemes to return the employees' own contributions in those cases where employees died in service or resigned or were dismissed before having qualified for pension

Some schemes however were subsequently amended by providing, in compensation for a reduction in the pension scale (e.g., from one-sixtieth to one-eightieth of pensionable salary for each year of service), a lump sum payment on death or retirement, the payment on death being intended to make some provision for a widow although the amount was usually too small to cover more than her maintenance for a short period. This plan was adopted in many schemes established after World War I.

Later, a further plan was introduced under which a pensioner in good health at his retirement could, at his option, relinquish part of his pension in return for an annuity to his widow after his death, This plan was of limited value for the purpose as it was not available for employees who had to retire because of ill health or who died in service

These haphazard extensions resulted in anomalies and hardship cases, and to remedy the situation thus created a more comprehensive scheme was developed whereby widows' pensions became an integral part of the arrangements. The lump sum which previously had been paid on retirement or death was reduced in the case of married men and replaced by a widow's pension equal to a proportion (eg., one-third) of the man's own pension The full scale of lump sums is paid to bachelors and to women, and the terms of the widows' scheme are so arranged that, for married men as a whole, the reductions in the lump sums are actuarially equivalent to the widows' pensions Plans on these lines were introduced after World War II in some of the public and quasi-public services in Great Britain.

In the period between World Wars I and II the growing recognition of social problems led to considerable activity in the establishment of pension funds. At the same time, the serious unemployment situation gave rise to a tendency to reduce the retirement age and to retire employees at the minimum age permissible under the rules to make way for the younger unemployed and so to relieve the labour market,

A further great expansion in the establishment of schemes took place after World War II, but the situation otherwise was radically different. Shortage of labour, increased longevity and improved standards of fitness at older ages led to a reversal of the retirement policy, and older employees were encouraged to continue in service as long as they were capable of carrying out their duties. To this end, the maximum number of years allowed to reckon for pension purposes was raised in some cases; e.g., from 40 to 45.

Further, in order to facilitate change of employment without the loss of accrued pension rights, a system was introduced in the public and semipublic services in Great Britain under which, by mutual agreement, a "transfer value" is paid out of the pension fund from which the employee is withdrawing into the fund of which he becomes a member, and he is then given credit in the latter scheme for an appropriate number of years of past service.

Financial Principles .-- As indicated above, the need for sound financial arrangements was often overlooked when the earliest schemes were started; in the following section the underlying prin-The average salary system approximates to giving each employee ciples of contributory schemes are briefly examined. In order that a fund may be in a position to meet its obligations it is essential that the capital in hand, together with the real value of contributions payable in the future, is not less than the present value of future benefits If this equivalence is maintained, the accumulated fund will continue to increase over many years until the expenditure on benefits becomes stabilized Where, for example, the number of new entrants each year is constant over a long period the position will eventually be reached when the current expenditure will exactly balance the combined income from contributions and interest When this occurs the active and retired staff will have reached a stationary condition and very substantial reserves are necessary since in many cases the current expenditure on benefits grows to more than twice as much as the contribution income, and the interest on a fund, which may amount to more than three times the current salary bill of the firm, is required to secure equilibrium The fund should be sufficient without relying on the contributions of future entrants, and its solvency should not be jeopardized if it is decided to close the fund to new entrants In the past the reasons why large funds should be built up were not always appreciated, and it sometimes happened where a sound fund had been accumulated that an uninformed decision was taken to increase benefits without regard to the enhanced habilities, often with disastrous results This experience was not confined to one country in particular. Many instances in which a scheme, having been started on unsound lines, had to be reconstructed later can be found In this connection reference can usefully be made to the report of the New York City Pensions commission (1916) and to the history of superannuation schemes in the British railways disclosed in 1910 by a departmental committee.

Before a scheme is launched the actuary has to estimate the contribution required to provide the benefits, basing his calculations on the various elements affecting the problem, the most important of these are the rate of interest which will be earned on well-secured investments, the rates of mortality likely to be experienced by the active staff and pensioners respectively, the proportion of staff that will resign voluntarily or that will be retired on health grounds before reaching the normal pension age, and the rate of progression of salaries (on the average) from age to age during service. Such an estimate must necessarily be tentative since experience as to all or many of these elements may change in the future; it is necessary. therefore, that the financial structure of the scheme should be reviewed periodically by an actuary and, if the valuation discloses a deficiency or a disposable surplus, appropriate action should be taken to restore equilibrium.

Back Service .-- At the initiation of a scheme the determination of the terms on which existing officers should be included presents some difficulty. Some credit for back service is generally deemed essential, otherwise the pension available in many cases would be too meagre for subsistence. In practice the problem has been dealt with in various ways, for example, it is not unusual to provide for all back service to count at one-half the standard rate, the whole of the cost of the concession being borne by the employer. Even so the liability cast upon the fund at the outset is substantial and ordinarily its redemption is carried out over a period of years.

Life Office Schemes.—Assurance companies offer many facilities to employers desirous of setting up superannuation schemes, and often an arrangement for the liabilities to be reinsured with a company is preferred in lieu of instituting a drivate superannuation fund. There is a wide choice of contract, and though generally speaking it is not possible to secure quite so much elasticity (e.g., in regard to disability) as under a self-contained scheme the method is popular because it is simple to work and because it protects the employer from the effects of fluctuations of experience. Again, it is peculiarly adapted to occupations where migration from one employer to another is customary, and for this reason is common in the United States where, generally speaking, immobility is thought to be a clog on efficiency. Common forms of policy prowide in return for periodical contributions, deferred annuities of a fixed sum payable on attainment of a specified age (with or without returns of premiums in the event of earlier death), or endowment assurances securing a lump sum (with or without bonuses) at a specified age or earlier death.

In those cases where the contribution is based on salary the amount of the annuity or the sum assured is fixed in relation to the salary current when the policy is taken out, supplementary contracts being effected when increases of salary occur. A variation of the deferred annuity system provides an annuity of fixed amount for each year's service, the increment of pension being secured by the contribution (increasing year by year) paid in the related year of service Another plan, which had its origin in the United States, is to make provision for pensions by a group assurance covering several provident benefits for the staff of a particular undertaking These group policies at the outset afforded protecand superannuation

STUPPEDEDGATION by negrifice S. W. F.; D. A. bby, is

SUPEREROGATION, the performance of more than is asked for, the action of doing more than duty requires (late Lat supererogatio, payment beyond what is due or asked). In the theology of the Roman church, "works of supererogation" are those which are performed beyond what is required by God, thus forming a reserve store of works of ment which can be drawn upon for the dispensation of those whose works fall short of the standard

See Catholic Encyclopaedia, article "Supererogation."
SUPERHETERODYNE RECEPTION, a means of radio reception in which the received current is combined with the current from a local oscillator (a.v.) and changed into a current of intermediate frequency. This is then amplified and detected to reproduce the original signal wave

SUPERINTENDENT, a term which, apart from its general use for an official in charge, has a distinct religious connotation, being applied, eg, to the head of a Sunday school and to the chief minister in a Methodist circuit In its most important historical sense it refers to certain ecclesiastical officers of reformed churches of the Lutheran model

In the confusion of the Reformation the name of superintendent was given to a class of men who discharged many of the functions of the older bishops, while bearing a character which in several respects was new. Only in Denmark was the name of "bishops" reserved for the new officers after the Lutheran model had been adopted and the older bishops had been deposed and imprisoned It survived there, though no claim is made that it is the sign of formal apostolical succession. In Scotland the First Book of Discapisne provided not only for ministers, teachers, elders and deacons, but also for superintendents and readers. The superintendents (who were appointed because of the scarcity of Protestant pastors) took charge of districts corresponding in some degree with the episcopal dioceses, and made annual reports to the general assembly of the ecclesiastical and religious state of their provinces, in the churches of which they also preached.

Duties of Superintendents .- The distinctive character borne by the new officers was determined by the cardinal principles which Luther had laid down in his work regarding the religious functions of the state. He conceived of the secular government as an ordinance of God, and as being set to direct and control the external fortunes of the church,

He hoped that righteous magistrates would at all times form a sound court of appeal in times of ecclesiastical disorder, and that they would guard the interests of truth and justice more securely than had been done under papal jurisdiction. The superintendents. who now had to undertake large administrative responsibilities in the church, were therefore to be appointed by the civil power and to be answerable to it. They were to stand as intermediaries bein their districts on the other.

In his earlier writings Luther had laid his main emphasis on

was declared free not only to preach but also to administer the sacraments and to rebuke evil livers. The differences in office and function between the members implied no difference in rank. for the members of Christ's church were all members of His body, and Luther believed that they would all be ruled into true order and charity by the Head But he was shaken by the Peasants' War and his faith in the virtues of the average man never recovered

The result was seen in his later writings, where he expresses his conviction that men need to be directed and restrained from without, and he looks to the state to undertake this duty. In the last resort the civil magistrates must take control of the church His vindication for thus subordinating the ecclesiastical to the civil lav in his assumption that the rulers of a Christian land would themselves be Christian, and it was the Christian duty of the church to render obedience to those who had been ordained of God to bear rule. He was as firm a believer in a visible Catholic church as were any of those of whom he speaks as "the adherents of the old religion." Luther, always conservative in feeling, clung to an alliance with the state and denied that the repudiation by the reformers of papal authority had severed them from the visible church.

The character of the office and duties of the superintendent were not everywhere the same. Luther shrank from imposing any stereotyped forms and asked that the special circumstances of each separate district should be consulted. He hoped that as few changes as possible would be made, and trusted that the reformed doctrines would spread peacefully throughout the country After the Diet of Speyer (1526) the civil authorities were invited to reorganize the Church in their respective dominions as they thought best. In the free towns superintendents were answerable to the city fathers for their good order. There were difficulties in the territories of the German princes, and in the case of Saxony Luther proposed to the elector that his first step should be to send out a commission of visitation which should report on the moral and spiritual condition of his principality, district by district. His proposal was carried out, and Luther himself became one of the visitors (1527-1528). He found the people in a state of such religious indifference and ignorance, and the clergy living often in such grossness, that his faith in their fitness to govern themselves ecclesiastically sank even lower than before, and he resisted all schemes for self-government such as had been proposed by Francis Lambert. The church organization which he devised for Saxony provided no place for democratic or representative elements; the grasp of the state must at all times be felt. The superintendent must speak at all times as a minister of the state, and the state must be represented in the synod to which he makes his first report, for upon the synod there must sit not only the pastors but also a delegate from every parish. If any appeal should be made from the decisions of the synod it must be heard in the court of the electoral prince, for he, as supreme civil ruler, possessed the jus episcopale, the right of oversight of the churches. Luther proposed that he should exercise this right by appointing a consistorial court composed in part of theologians and in part of canon lawyers, and it was thus that in 1542 the Wittenberg ecclesiastical consistory was formed. Other principalities adopted the model, so that the institution became common throughout the Lutheran churches.

In this scheme the superintendent (or superattendant) was charged with such part of the duty of the older bishops as had been purely administrative. He must concern himself with the discharge of their duties by the pastors of the churches, as well as with their character and demeanour. He must supervise their conduct of public worship, as well as give them licence to preach. He must take cognizance of their ministry to the indigent in their parishes, and of their management of the schools. He must further direct the studies of candidates for the pastoral office. He was answerable to the civil authorities to report all evil-living and false teaching.

The earliest occasion of the appointment of such a superin-

the spiritual priesthood of all believers. Every sincere Christian Saxony about 1527. He assigns the duties of the office, and summons the newly appointed officer to give diligent heed to the conduct and teaching of the pastors under him, faithfully to warn them of all errors, and, in case they prove obstinate, to report them to the electoral court. He must further give close attention to the due observance of the marriage laws, for in this matter the previously appointed visitors to the principality had reported grave laxity

Some of the smaller principalities appointed but a single superintendent for their territory, who, instead of being answerable to a consistory, sat as spiritual member on the territorial council, whilst in towns the superintendent was summoned to the town council whenever Church matters arose for discussion In larger states there were various classes of superintendents with their respective duties severally assigned

In modern times the functions of the superintendent have been somewhat confused in consequence of the introduction into Lutheran Church theory of inconsistent elements of Presbyterian and

therita content theory of the Reformation (xoo6), i. 400-416;
See T. M. Lindsay, History of the Reformation (xoo6), i. 400-416;
and the articles "Kirchenordnung" and "Supermendent" in Herzog-Hauck's Realencyklopadie fur protestantische Theologie und Kirche.

SUPERIOR, a city in the northwestern corner of Wisconsin, U.S., at the western end of Lake Superior, opposite Duluth, Minn. with which it is connected by bridges; a port of entry and the county seat of Douglas county. It is on federal highways 2, 35 and 53, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Ornaha, the Duluth, South Shore and Atlantic, the Great Northern, the Northern Pacific and the Soo Line railways, and many lake steamers Pop. (1950) 35,091; it was 35,136 in 1940 by federal census The city occupies a spacious site (42 sq mi.) on gently rising ground facing three bays (Superior, Allouez and St Louis). It has 29 mi of water front, and shares with Duluth (q v) one of the finest natural inland harbours of the world, ranking second only to New York among the ports of the United States in the amount of commercial tonnage handled There is ample water power, and the manufacturing industries are important

Superior has a cheap fuel supply and power is furnished by electricity generated on the St. Louis river

Superior is also an important grain market Flour is the principal product, and shipbuilding is important. Among steel ships, the type, now almost entirely extinct, known as the "whaleback originated there, and iron and wooden ships, launches and small pleasure craft are also made Other manufactures are railway cars, coal briquettes, sawmill and planing mill products, furniture, door catches, windmills, gas engines and heavy machinery.

Much iron and copper ore is shipped from the Duluth-Superior harbour, and large quantities of coal, brought by lake boats, are distributed from there throughout the United States and Canadian northwest.

Superior is the seat of a state teachers college (established in 1803).

Pierre Esprit Radisson and Medard Chouart des Groseilliers probably visited the site of Superior in 1661, and it is practically certain that other French coursurs de bois were there at different times before Daniel Greysolon, Sieur Dulhut (Duluth), established a trading post in the neighbourhood about 1678. About 1820 the Hudson's Bay company established a post there, but there was no permanent settlement until after the middle of the 19th century. Attention was directed to the site by a survey made by George R. Stuntz, a government surveyor, in 1852, and in 1853 a syndicate of capitalists, at the head of which was William Wilson Corcoran, the wealthy Washington banker, associated with whom were Senators Stephen A Douglas (for whom the county was named), R. M. T. Hunter and J. B. Bright, former Senator Robert J. Walker, Congressmen John C. Breckinridge and John L. Dawson, and others, largely southern politicians and members of congress, bought lands there and platted a town which was named Superior The proprietors secured in 1856 the construction of a military road to St Paul, Minn., 160 mi long. The town tendent would seem to be found in the decisions of Prince John of grew rapidly, and in 1856-57 had about 2,500 inhabitants. The panic of 1857 interrupted its growth, and the population dwindled so that in 1866 there were only a few hundred settlers on the town-site. The Civil War increased the depression, and the lands of those who had taken part against the Union were confiscated. In 1862 a series of stockades was built as a protection from the Indians. Within the area under the government of the town of Supenor, which was at first co-extensive with the county, West Superior was platted in 1883 and South Superior soon afterwise. A village government was established in September 1887, including the three settlements mentioned, and in April 1889 Superior was bettlements mentioned, and in April 1889 Superior was chartered as a city. The harbour was surveyed in 1833—1835 by Laeut Henry Wolsey Bayfield (1795—1882) of the British Navy. In 1860—1861 it was resurveyed by Captain Genge G. Meade, who was engaged in the work at the outbreak of the Civil War. A branch of the Northern Pacific 1ailway was built to Superior in 1881.

SUPERIOR, LAKE, the most north-westerly of the Great Lakes of North America, and one of the largest bodies of fresh water in the world, is bounded on the east and north by the Province of Ontario, on the west by the State of Minnesota, and on the south by Wisconsin and Michigan.

Physiography.-It has deep, extremely cold, clear water, and high and rocky shores along a large portion of its coast. Its general form is that of a wide crescent convex towards the north, but its shores are more irregular in outline than those of the other lakes Following the curves of its axis from west to east the lake is about 383 m. long, and its greatest breadth is 160 miles. Its maximum recorded depth is 1,302 ft., and its mean height above sea level 602 14 ft . 22.38 ft. above that of Lakes Michigan and Huion, to which it is joined at its eastern extremity through the St. Mary's river. The lake receives the waters of 200 rivers, and drains a territory of 40.080 sq mi, the total area of its basin, including the water surface of the lake, being 80,900 sq. miles. The largest river which empties into it is the St. Louis, at its western end. The principal rivers on the north shore are the Pigeon, which forms the international boundary line, the Kaministikwia, the Nipigon, which drains the lake of the same name and together with the lake is about 200 m. long, the Pic, the White and the Michipicoten, No large rivers empty into Lake Superior from the south. There are not many islands in the lake, the largest being Isle Royale, 44 m. long, Michipicoten island in the eastern part; St Ignace, in the northern part, off the mouth of the Nipigon river; Grand island between Pictured Rocks and Marquette; Manitou island east of Keweenaw Point, and the Apostle Group, to the north of Chequamegon bay.

The boundary between the United States and Canada follows a median line approximately to about mid-lake; thence it sweep north-westward, so as to include Isle Royale within the territory of the United States, and continues near the north shore, to the mouth of Pigeon river, which it follows westward, leaving the whole west end of the lake in US, territory.

Resources of Region.—The Lake Superior region is rich in minerals that have been extensively worked The lake is, as it were, surrounded by iron, which is the probable cause of very strong magnetic fields of influence. Native sulver as well as silver orês exist around Thunder buy, native copper was formely worked on lake Royale, and rich copper mines are worked on the south shore, while nickel abounds in regions of the country north of the lake.

Coasts and Currents—It has a picturesque coastline, the north shore particularly being indented by deep byas surrounded by high cliffs; the islands also rise abrupily to considerable heights, the north shore furnishing the boldest seenery of the Great Lakes. On the south coast, opposite the broadest part of the like, are precipitous walls of red sandstone, extending about 14 mi, shinois at the Fletured Rocke, so called from the effect of waye action on them. There are no appreciable titles and little current. A general sket of the water towards the 'outlet ext., especially on the southern shore. From the Apostle islands to the existing of the well-well was current to a great width, and (loweds the eistern end of the lake spreads out in the shape of a sam, a branch passing to the northward and westward reaching the

north coast Autumn storms raise dangerous seas. The level varies with the season, and also from year to year, the maximum variantion, covering a cycle of years, being about 4 ft. The discharge of the lake is computed to be 27,2000 cut. The re-scond at mast stage of water, and is controlled by dikes and sluice gates at the head of St. Mary's falls.

Navigation.—The season of navigation, controlled by the opening and closing of the Sault Ste Marie canals, swerges about eight months—from the middle of April to the middle of December. The lake never freezes over, though the temperature of the water does not, even in summer, rise far above freezing point. The bays freeze over and there is border ice, often gathered by wind mol large fields in the havs and extremities of the lake.

Into large fields in the bays and extremities of the lake.

Harbours—Lake Superiot is fairly well provided with natural harbours, and works of improvement have created additional harbours of religue at various points. Marquette and Presque Isle Point, Mich; Agate Bay and Grand Marais, Minn.; and Ashand, Wis., are on bays which have protective breakwaters across their mouths Duluth, Minn.; Superior and Port Wing, Wis; and Ontonagon and Grand Marais, Mich, are harbours with entrances formed by parallel jettles extending across obstructing bars. On the Canadian side Ft. William, in the mouth of the Kammistikwis, and Port Arthur, 4 mil distant, an artificial harbour, are the moly important shipping points, being the lake terminals of two great transcontinental railway systems, though the whole north shore is liberally supplied with natural harbours.

Commerce.—The traffic on Lake Superior grows constantly in volume. The data collected at United States and Canadian locks at Sault Ste Marie showed an increase of 100% in tonnage throughout the first quarter of the 30th century, resulting in 83,-000,000 tons annually and more than 50,000 passengers. In the second quarter there were similar increases, and the annual traffic in the 1950s represented a total of almost 200,000,000 tons and more than 60,000 passengers.

The principal freight shipped east consists of flour, wheat and other gains, through Duluth-Superior in the US and through Ft. William-Port Arthur from the Canadian prantes; copper ore from the mines on the south shore; from ore in mmense quantities from both shores, the principal ore-shipping ports being Ashland, Two Harbors, (Munn.), Marquette and Superior. Lumber, produced on the tributary rivers, is another important cargo. West-bound freight consists largely of soft coal for general

west-bound freight consists largely or soft coal for general distribution and for terminal railway points. Stone and petroleum represent most of the remainder of freight shipped west.

SUPERNATURALISM, a term that may be used for the attitude of mind in which experience of the unfamiliar or uncanny appears to invest it with a distinct character, as if it belonged to a world of its own. On the psychological side it involves the somewhat complex mood known as awe, in which, as W. McDougall shows, various primary feelings such as fear, wonder and submissiveness commingle in no very fixed proportions. On the institutional side it provides raw material alike for magic and for religion. As Hartland puts it, commenting on Marett's use of the term, supernaturalism furnishes the original "theoplasm, god-stuff." Primitive notions of the type of mana (qv.) refer to this special class of experience in which the subject feels powerfully moved and the object seems powerfully moving, so that both inwardly and outwardly wonders happen, whether for better or for worse It is certain, on the other hand, that the savage does not spend all his time in wonderland, but distinguishes another world, another level of experience, which as the Polynesians phrase it, is noa, "commonplace"—the routine of every day. Our word "natural" has to-day very similar associations, though as a matter of fact, if Hubert and Mauss are right, the Greek physis, literally "growth," from which our conception of nature is derived, originally meant much the same as mana, namely, the occult force that makes things grow If it is felt that the word "nature" ought to be reserved for the whole order of the universe, as being rational and intelligible, the more pedantic term "super-normalism" may be substituted, though it cannot be denied that psychologically and historically men have been inclined to view the regular course of things, and certain interruptions of it, as sharply contrasted aspects of mind and being

II, as snapy contrasted spects of mind and open of Rigion (1914); E 5 Hatland, British Association Report, Address to Section II (1906); H Hubert et M Muss, "Equipse d'une thôme générale de la Mage" in L'Innée Sociologique, vol vu (1904); W McDougall, An Introduction to Social Psychology (oth et 1915). (R R M)

SUPERNORMAL CHILDREN, EDUCATION OF. T L Terman calls children "superior" if they have intelligence quotients of more than 110-ie, if they mature, mentally, more than 10% faster than the average He designates as "gifted" those with intelligence quotients of more than 135 The education of "superior" children does not present a major problem They do not diverge so widely from the average as to require any basically different educational approach

"Gifted" children are almost a distinctive type, and require, for their adequate development, a distinctive kind of education Not only are they from two to four or more years further advanced in mental capacity than other children of their age, but their superiority tends to be general Contrary to popular notions. gifted children are, on the average, large for their age and well developed; and they excel in many personality traits. It is in this group that there reside the greatest potentialities for distinguished achievement in life. For this reason it is important to adapt their schooling to their needs

The commonest, and least satisfactory, way of trying to adjust the school to the needs of gifted children, is to have them skip grades This does almost nothing toward developing their special abilities, though better than retaining them in lower classes

The next commonest practice consists of "ability grouping." Children are classified as X, Y, or Z according to their general ability as shown by intelligence tests, teachers' judgment, etc. The brightest, or X, group is, ideally, given an "enriched curriculum," going into each subject more intensively and extensively The large majority of the children in the X group, however, are merely "superior" rather than "gifted," and the ability grouping is, accordingly, adjusted to their needs It is not an adequate solution to the problem of the really gifted child.

A third method of caring for gifted children is through classes organized especially for them. Germany was the pioneer in this field, but in the United States by 1930 there were 135 such classes. They depart widely, in the best instances, from usual school practice. Routine drills and reviews give way to independent investigations and reports, the children using libraries, laboratories, shops, museums, and excursions. There is considerable freedom. Creative expression and originality are stressed.

The most common objection to such classes for gifted children is that they may tend to make children conceited. Proponents of special classes, however, claim that direct experience does not bear out this criticism, and argue that children competing with their peers are less prone to conceit than are those who are constantly associated with children of inferior ability.

A more practical objection lies in the fact that since less than one percent of school children are gifted, only the larger cities have a sufficient number, at the different grade levels, to make such classes feasible. In those cities, however, where special classes for gifted children have been organized, the consensus is that the gifted children get a real chance to develop their abilities; and as experience accumulates, such classes should be able to provide almost ideal conditions for them.

In smaller communities, the problem is more difficult. Hope lies in some of the newer general methods of education. So-called progressive schools, particularly, stress for all children just the types of education found most suitable for gifted ones-freedom.

responsibility, and much more emphasis on original investigation.

Where individual progress is added to these "progressive" methods, as for example, in Winnetka, Ill., a partial solution appears. Gifted children are allowed to progress somewhat more

rapidly, their individual programs are enriched with special assignments, electives, and responsibilities, and they are given considerable freedom, participation in group activities, and stimulus toward original investigation and creative work

This kind of procedure in smaller communities, and, in large cities special classes for gifted children, are, up to the present, the best solution that has been found to the as yet inadequately solved problem of the education of gifted children. (C. WAS )

SUPERNOVA: see Nova and Supernova. SUPER POWER. The term has come into wide use, particularly in the United States, in connection with the extensive development of the electric power industry. It has been defined as "the systematic grouping and interconnection of existing power systems to the end that greater economy will be effected." It means in its final form, generation at large, highly efficient plants, transmission in bulk at very high voltage, such as 220,000 volts and supply to existing power systems in large blocks

Technically, the basis of super power hes in the economy effected in interconnecting systems with peak loads coming at different times, thus reducing spare capacity and therefore investment, and bettering the load factor of the interconnected gen-

erating plants.

SUPERSTITION. Like many words having a derogatory sense, "superstition" is often loosely and vaguely used, and is therefore not easy to define To identify it, for example, with false belief or practice would be quite misleading. For in the first place, the field in which superstition is generally to be found, the magico-religious, is the very one in which the standard of truth and falsehood is most subjective and fluctuating, in the second, a custom or belief, religious or not, which is false may nevertheless be accepted at some times and places by men of enlightened intellect and conscience To call a person superstitious, however, regularly implies more or less definite mental or moral deficiency Thus, we should describe a man as superstitious who in a modern European or American community seriously believed that to break a mirror brought bad luck; but the original holders of that or a similar belief were perfectly reasonable in their views, according to their lights. Supposing that a shadow or reflection was in some sort a part of the soul, they naturally concluded that to break it, by breaking the substance upon which it was cast or reflected, was to injure the soul or life itself. They had merely been misled by a false inference. In like manner many savage customs and ideas, often described as superstitious by explorers or missionaries, turn out on investigation to be the product of quite sound reasoning, vitiated by the false premises on which it is based. To adhere irrationally to these premises after having their falsity clearly demonstrated might indeed be called superstition.

The word in question being of Latin origin, light may be thrown upon it by the usage of a Latin author Vergil, in a well-known passage (Aen. viii 187), characterizes superstitio as uana (empty, groundless) and also as ueterum ignara deorum (having no knowledge of ancient gods, ie, of well-tried and long-established religious ideas) If we turn to the Greek equivalent δεισιδαιμογία, literally "fear of superhuman powers," we find Theophrastos (Characteres, 28-[16]) ridiculing the δεισιδαίμων, not for holding polytheistic views nor for believing in omens, but for spending much time in the worship of obscure and foreign derties, and paying a ridiculous amount of attention to petty omens, such as a more sensible man would disregard.

We may now perhaps attempt to define superstition as the acceptance of beliefs or practices groundless in themselves and inconsistent with the degree of enlightenment reached by the community to which one belongs. It is clear that such a definition excludes, for instance, the mental attitude of one who, about the year A.D. 50, or in the middle ages, believed in astrology, which was accepted and defended by many, though not all, intelligent and well-educated persons of the time; it also excludes the action of a savage who adores what is to Europeans a ridiculous and nonexistent godling. But it includes, for example, those contemporaries of Plato who let themselves be deceived by the lower practitioners of Orphism, or by those moderns who appear seriously to believe in mascots. Even so, a certain element of varueness is unavoidable, since agreement is far from being reached as to what ideas, and consequently what practices, especially those having reference to things not obviously material, are false and unenlightened A long list might be drawn up of things which some would regard as false and outworn, others as plausible or even certainly true, it would range from theistic belief and religious observances of any sort to such matters as second sight and dowsing or water-finding There still remain, however, a great number of ideas and actions which the consensus of educated modern opinion would regard as superstitious in the sense above defined. These remaining superstitions fall into two categories, survivals and accretions

Survivals,-It is well known (see Anthropology: Folklore) that a great many customs characteristic of a less advanced stage in social and intellectual evolution survive into higher stages, either as meaningless and fossilized customs or because a new significance and use has been found for them. Thus many performances originally magical survive, more or less modified, as games for children or adults; a new use, the satisfaction of the play-instruct, has been found for them, but in their details they show, on investigation and comparison, traces of their original purpose Again, the very old Northern European custom, in origin probably a fertility-rite, of decorating the house with greens at Christmas, survives simply because it is a pretty and picturesque traditional usage. Some such customs have become matters of etiquette. The need being still felt for some kind of conventional gesture to express friendly feeling or desire for better acquaintance, the old, probably magical, gesture of "handshaking" is still in use, and from childhood, we are taught to use the right, or lucky, hand for the purpose. The reason now given is that it is polite to use the right hand rather than the left; here as in many other instances what is now polite was once magically good. Such things as these can hardly be called superstitions; certain customs being still found necessary in various spheres of modern life, and the old ones being in themselves inoffensive, it saves mental effort to retain them, although their original meaning was something quite foreign to our conceptions. But alongside of these some things survive which are useless or even obnoxious, on any theory of conduct, expressed or understood, save one involving some now exploded doctrine.

A good example is furnished by rest-days The whole experience of mankind proves that it is advantageous to have occasional periods in which no avoidable work is done, since in the end the worker actually achieves more than if he had not rested, in addition to tiring himself much less; and for this there are sound physiological and psychological reasons Moreover, it is the perfectly reasonable practice of members of the higher religions, such as Christianity and Islam, to set apart certain days (Sunday, Friday, etc ) for the intensified practice of their worship. But it is well known that, long before either an ethical religion appeared or the physiology of fatigue was studied, tabu-days, like the gennas of the Nagas, were observed by people in a savage or barbarous stage of culture, owing to the belief that, at regular or irregular intervals, the prevailing conditions were so magical that ordinary work would be unlucky or would prevent or hinder the beneficent effect to be expected from these conditions. Now the feeling that on certain days certain occupations, or all ordinary occupations, are particularly unlucky (or lucky) is quite common at far higher stages than these. Those who appear seriously to believe in the unluckiness of Friday for starting any work may rightly be called superstitious, for the ground of their conduct is ultimately the savage notion of the incompatibility of ordinary occupations with the spiritual atmosphere, so to call it, of a tabu-day, in this case a Church fast-day of comparatively modern origin. Not dissimilar considerations apply to the quite wide-spread avoidance of the number thirteen, ultimately based upon very ancient ideas of the peculiar character of this number.

Accretions Evidence of the survival, among a civilized poulation of a savage type of mentality is furnished abundantly by the occurrence of quite new superstitious practices in our own day, and in circles, not always uncultured, of Europeans and Americans. It is of course a commonplace that gamblers are superstitious, and many of their practices may fairly be deemed survivals, such as turning a chair around to "change the luck" (imitative or homocopathic magic) or wearing a mascot (fetishism?) But examples are not wanting of entirely new beliefs, based upon modern conditions and having no near parallel in savage or ancient custom. A popular English newspaper finds it necessary, owing to its large circulation, to employ a number of presses In order to check, and, where necessary, correct the work done by each of these, it has its title printed in a slightly different manner by each machine, the difference consisting of a varying number of small white dots in the large black lettering A few years ago a firm belief grew up among its less instructed readers that these dots conveyed racing "tips", thus, if there were three dots in the letter D, they signified that in the third race of that day a horse whose name began with D was the likely winner

Here we have a definitely superstitious belief, although connected with no magical or religious idea, old or new Clearly such a delusion would have been impossible but for two factors (1) Instead of rationally crediting the paper with the possession of a good deal of information on various subjects, gathered through reporters and by other such means, these readers manifestly supposed it to have a quasi-omniscience, embracing such unknowable things as the result of a race not yet run (2) Whereas it is in fact the custom of newspapers to state in plain language, in their sporting columns, which horse they think likeliest to win a given race, it seems to have been vaguely felt that it was more in keeping with the supposed oracular and infallible wisdom of the Press to adopt a symbolic style and set forth valuable information in a riddling form

The above example throws some light on the question whether superstition is declining in modern civilizations. The statement that it is rapidly disappearing is often and confidently made, but on examination of the instances given in support of such assertions, it will be found that what are really disappearing are certain old and traditional forms of behef or custom, which have rather gone out of fashion than been overcome by reason. For example, in Britain and America very little is left of the old rites connected with the last sheaf. This is only partly due to the spread of education among country people; probably not many farm labourers could say either what the old rites were or why they were irrational, it is rather the result of the rapid drift of population towards industrial centres, and the consequent influence on the country of town ideas Now the townsman, not being a producer of foodstuffs from the soil, is apt to laugh at the customs connected with them as rustic; compare the contemptuous tone of such words as rustre, rusticus, boor, άγροικος, etc The irrational custom has been irrationally displaced. Here, therefore, is no evidence of the growth of a more logical and critical mentality, less prone than the old to superstition; and it has already been shown that superstitious beliefs are actually in process of creation in the towns themselves. To take another example, while the traditional belief in witches seems practically confined to a few country districts and small towns, and the old methods of divination hardly survive at all, save as amusements, fortunetelling by various methods, mostly pseudo-scientific, including a crude and degraded form of astrology, is by no means extinct, as may be seen by examining the advertisements of popular magazines and also the police-court reports. At best it may be said that superstition appears to be yielding, although very slowly, to the gradual rise of the average intelligence which there is some reason to suppose exists, and that it may in time disappear with other irrationalities.

Other interconstruction of classical superstitions, see art. "Aborganics" in Pharmatheman, Enderschiehöldte, For others, see Aveninovinors Bibliography; Fouxious: Bibliography; Souxious: Bibliography; Souxious: Bibliography; See also Lehaman, Aborgane and Zauberel (1898); A. Wuttke, Der deutsche Volksaberglaube der Gegenwart (1900), Philip. F. Waterman, The Story of Superstition (1921).

SUPER-TAX: 566 INCOME TAX. IN PRACTICE. SUPERTONIC, in music, the second degree of the diatonic tonal scale, as D in the scale of C, that is, the note next above the tonic, whence its name,

(See HARMONY.)

SUPLO, FRANO (1870-1917). Yugoslav statesman, was born of poor Croat parents at Cavitat (Raguas Vecchus) in southern Dalmata In 1900 he became editor of Nove Lett, a Croat paper published at Pume, which became a rallying ground for opposition to the intolerable regime of Count Khuen Héder-vérv

In 1905, together with Anton Trumbić, Pero Čingrija and Smodlaka, he drew up the resolution of Piume, which became the bass of political co-operation between Serbs and Croats in the critical period before World War I When the Magyar condition parties came into power in Hungary in April 1906, and placed the Serbo-Croat coalition in office at Zagreb, Supilo became a deputy at Budanest

Within a year Magyarizing tendencies produced an acute confict between Budapes and Zagreb, and for a time Supilo was the soul of Croat resistance. He thus became a marked man and was specially aimed at in the notorious forgeries by which the Austro-Hungarian foreign office attempted to prove Serbia's revolutionary intrigues in Croatia and thereby to justify the innecation of Bosma in roos.

At the Fredjung tral, however, in Dec. 1909, Supile was trumphantly undicated. He was the first to discover the secret negotations with Italy which culminated in the treaty of London (April 26, 1915), and earnestly winned Sazonov of the disastrous complications to which it would give rise, but he was unable to prevent the promise of wide Slav territories on the eastern Adriatic to Italy in the event of victory. Supile came into conflict with the Pan-Serb and reactionary tendencies of Pais's, and even withdrew from the Yugoslav committee, which in the early stages of the war he regarded as unduly subservent to Belgrade.

But before his premature death (in London, Sept. 23, 1917) he heartily endorsed the declaration of Corfu, issued in July 1917, which laid down the lines upon which the Yugoslav state was to be constructed.

SUPPÉ, FRANZ VON (1820-1895), Austrian musical composer, whose real name was Francesco Ezechiele Ermenegildo Suppé-Demelli, was born at Spalato, in Dalmatia, in 1820, and died at Vienna in 1805

Originally he studied philosophy at the university of Padua, but on the death of his father devoted himself to muse, studying at the Viennas conservatoirs. He began his musical career as a conductor in one of the smaller Viennase theaters, and gradually worked his way up to be one of the most popular composers of ephemeral light opens of the day. Outside Vienna his works never wom much success of his 60 comic opens Patinitzs (Vienna, 1876; London, 1882) only enjoyed moderate favour

Suppé's overture to Dichter und Bauer, widely known as the Deat and Peasant overture, became his most successful orchestral work. He also wrote some church music, including a mass, Missa dalmatica (Spina, 1877) and a requiem, L'estremo Giudizio (Zara, 1860.)

# SUPPLEMENTARY ESTIMATES: see ESTIMATES.

SUPPIX; provision, more particularly the money granted by a legislature to carry on the work of government. In the United Kingdom granting of supply is the exclusive right of the house of commons, and is carried out by two committees of the house, one of supply and the other of ways and means (see Parliament). In the United States supply originates in the house of representatives (see Broner: United States of America)

SUPPLY, MINISTRY OF: see MUNITIONS, MINISTRY OF, SUPPLY AND DEMAND. Economics, or polltical economy, is sometimes defined as the science of supply and demand. Although this is an inadequate definition it cannot be said to be allogether mileading. A very important part of economics, and the part which probably has the best title to the name of science, has to do with the operations of supply and demand and with the way in which variations of supply and centand are related to the movements of prices and to changes in the production and distribution of wealth. The "law of supply and demand" was not invented or discovered by the economists, however, nor of they

lean very heavily upon it as a general explanatory formula. Long before there was any systematic analyses of economic processes men had observed that prices vary with supply and demand, and from the earliest days, trades have had to take account of that circumstance. The economist's task has been to scrutinize those characteristics of human behaviour and of the physical environment which determine the various forms or patterns in which supply and demand appear and to inquire into the complicated interactions of the demand for and the supply of different committees and services.

Elementary Principles.—Consider the familiar theorem that the price of a commodity must be such as to make supply and demand equal. If supply is taken to mean the amount solid and demand the amount bought the theorem is mere tautology, for supply and demand become different names for the amount transferred from sellers to buyers at any pince whatever. But if it be understood that demand means the amount which buyers would be willing to take at a specified price, that supply means similarly the amount which sellers would be willing to take at a specified price, that supply means similarly the amount which sellers would be willing to take at a specified price, that supply means similarly the amount which sellers would be willing to part with at a specified price, the supply are similarly the amount which sellers would be willing to part with a specified or lowered, the theorem has meaning and significance, for there will be one price, and only one price, at which supply and demand will be equal.

In another elementary theorem, namely that an increase of demand for a commodity will ruse its price, that an increase of supply will lower it, and that a decrease of supply or of demand will have an opposite effect, other meanings are attached to changes of supply and demand. Here an increase of demand or supply means an increase of the amounts which will be taken at given prices, not an increase which is dependent upon a redution of price. The general state of supply and demand, in the sense specified in the preceding paragraph, can be represented by lists or "schedules" of "supply prices" and "demand prices" In this other sense, however, supply and demand are regarded as independent variables, and a change of supply or demand means an alteration of the schedule of supply prices or demand prices, such as might come on the one hand from a change of consumers preferences or an enlarging of the market or, on the other hand, from a change of costs of production.

It is proper to assume that at any given time the immediate general condition of supply might be represented by a schedule in which the progressively higher prices which are required to evoke a progressively larger supply are set forth. But if the commodity is one which can be produced more economically if produced in large quantities, the ultimate effect of an increase of demand, in the sense of an increase of the amounts which will be taken at specified prices, will ordinarily be to reduce the price per unit at which these larger amounts will be supplied. In a schedule of supply prices constructed on the assumption that sufficient time is allowed to permit the necessary economies to be effected, larger supply will be associated with lower prices When the longperiod schedule of supply prices is of this type, the commodity is said to be produced under conditions of decreasing costs or of increasing returns. When, on the other hand, because of the scarcity of some necessary productive factor, increased supply cannot be had, even in the long run, except at a higher price, the condition is described as one of increasing costs or of diminishing returns The factors which give rise to increasing returns should not be confused with the circumstance that in many industries certain outlays (e.g., for plant and equipment) have to be incurred in advance or with the further circumstance that in a growing industry such outlays are ordinarily considerably larger than the volume of output immediately in prospect would require. Under such circumstances the additional or "prime" costs incurred by reason of an increase of output may be relatively small. Furthermore, with a progressive increase of output there will be a progressive diminution of costs per unit of output. because the general, supplementary, or "overhead" costs will be spread over a large number of units But although when the market is sluggish or when competition is especially keen, prices may be cut to a point where they barely suffice to cover the additional or "prime" costs, this condition, which cannot be lasting, should not be confused with a true condition of increasing returns, for this last condition is to be found only when a gradual increase of output is attended, in the long run, with genuine economies

Interactions of Supply and Demand.—The results obtained by taking account only of the supply of and demand for a particular commodity in relation to its price are no more than a first approximation to the truth In isolating, for reasons of practical convenience, the factors which determine the price of any one commodity, taken by itself, economists are accustomed to assume that the value of money, to both buyers and sellers, is constant. This means that no account is taken of the way in which changes in the amount of money which consumers expend for the one commodity will affect their ability to buy other commodities, or the way in which an increase of the production of the one commodity will affect the ability of producers to supply other commodities There are many instances of joint or complementary demand, as for fruit and sugar or for automobiles and gasoline, and of joint supply, as of mutton and wool, of coal gas and coke, of cotton and cottonseed The general rule is, however, that consumers' outlays for any one commodity can be increased only by reducing the amounts which they expend for other commodities, and that more of any one commodity can be produced only by displacing other possible uses of productive resources This general rule is not inconsistent with the fact that, making abstraction of the use of money as a medium of exchange, the supply of any one commodity is an expression of the demand of its producers for other commodities and services

There is a sense in which supply and demand, seen in the aggregate, are merely different aspects of a single situation. It is for this reason that some of the older economists held that general overproduction is impossible-a theorem which, though not really erroneous, has proved to be misleading. The effective demand of the producers of one commodity for other products depends not only upon how much they produce, but also upon the relative demand of other producers for that particular commodity as compared with other products. Only so far as the demand for a particular commodity is elastic is it true in any significant sense that an increase of its supply is an effective increase of demand for other commodities. There may be and often are maladjustments of supply and demand. Furthermore, production in general may at one time outrun and at another time fail to keep pace with the expansion of money incomes In either event there will be general fluctuations of prices, attended, as experience shows, by changes in the relative levels of the prices of different classes of goods and

The general form of the relations of supply, demand and price which obtain when all products are taken into account can be depicted mathematically in systems of equations, and thus the general character of the whole interdependent structure of prices can be laid bare. But empirical (statistical) studies of the relations between the fluctuations of the production of various staple commodities and fluctuations of their prices have shown that the first approximation previously referred to is generally a useful and often a surprisingly accurate approximation. It is necessary, of course, to allow for the effects of contemporaneous changes of the general purchasing power of money, and it is sometimes necessary to allow also for the effects of other important disturbing circumstances. But it is not necessary to take account of complications of a secondary order of importance in order to obtain "empirical laws of demand" for such commodities as wheat. cotton, sugar, beef and potatoes which appear to be fairly reliable, at least over periods of some years.

Inclastic Supply—The rule that supply and demand may be regarded as functions of or dependent upon price must be so interpreted, of course, as to allow for the circumstance that the supply of something is fixed and is no way responsive to an mercase of price. As the production of other goods increases, the prices of these nonreproducible forms of wealth must inevitably increase, unless the demand for them falls off. If these nonreproducible things are necessary instruments in the production of other goods, and land is, then other goods will be produced under

conditions of diminishing returns, unless this disadvantage can be offset by improvements in productive processes or by cheaper supplies of other necessary productive instruments. For some purposes it is convenient to assume that the aggregate supply of reproducible goods, or of reproducible productive goods, is fixed for the time being. The problems of supply and demand then have to do merely with the apportioning, by exchange, of an existing stock of goods, or with the assigning of productive instruments to the most important of their various possible uses Thus the increase of the supply of labour in a given industry or a given locality may be taken to depend largely upon a possible transfer of workers from other industries or other localities. Whether labour in the aggregate may be said to have a supply price (se, to be responsive in the long run to an increase of wages) is a question to which the Malthusian theory of population gave a more nearly unqualified affirmative answer than would be supported by the present opinion of scholars (See also Demand, Economics, and Price) (A Yo)

SUPPLY AND TRANSPORT, MILITARY. An army may be divided unto two component parts the combat troops and the service forces. The combat troops cannot accomplish ther mission without the support of the service forces which help them to move and furnish them with the supplies and services necessary to be an affective force when the purple.

Militarily, the term "supplies" includes all things necessary to equip, maintain and operate armed forces. It includes such items as food, clothing, arms, ammumition, fuel, gasoline and libbreants, construction and maintenance materials, vehicles and varied types of machinery.

Supplies are obvously of little value to an army unless an adequate transportation system is available to move them to areas where they are needed Lack of adequate transport in a wartime stuation will frequently cause an army to abandon a tactical plan which is otherwise feasible. An army's transportation system includes all means of transportation—water, highway, rail and air—at its disposal both within its home country and within and air—at its disposal both within its home country and within and aroute to its theatres of operations. The establishment of such means creates lines of communication. The operation of the means of transport must be co-ordinated and controlled to eliminate bottlenecks, ensure that they are carrying the personnel and supplies they are capable of moving, and give the transportation system the flexibility necessary to function in changing tactical situations. Movements of troops and supplies are classified as tactical when surface contact with the enemy is considered possible, and as administrative when such contact is not expected

The basic principle of supply envisages a steady flow of supplies from care to front. Forces in rear areas are responsible for procuring and transporting supplies to combat troops. This refleves tactical commanders from such administrative burdens and permits them to devote their major attention to the defeat of the enemy. During the planning stage for a campaign or battle, an army commander informs the supply services supporting him of his operational plans. Thereupon the latter services estimate their capabilities to support the tactical plan logistically. Especially in a large-scale operation, the final tactical plan normally represents a balance between what the army commander wishes to accomplish and the ability of the supply services to furnish him with the matériel and transport necessary for success

Until the early 17th century, armies lived off the country. Sometimes they bought supplies; more offen they obtained what they needed by outright confiscation. This system of supply so rawshed various countries in Europe during the Thirty Years' War that it came into popular disrepute. Thereafter, army commanders customarily pand for supplies and stored them in warchouses to be used as needed. From this beginning a system of supply and transport evolved which became increasingly effective with continued improvements in mechanical transport. The huge armies of the 3oth century with their varied and specialized needs could not live off the land alone even if they wheel to do so

World War I.—This war taught the armies of the world two important lessons. The first was that, other things equal, the army that could best supply its troops in the field would be victorious.

The second was that the supply of a complex modern army involves the manpower and resources of an entire nation Germany enjoyed an initial advantage in the war because its army had built up a tremendous reserve of supplies of all classes and had worked out a detailed plan of distribution to its forces in the field The British, French and U.S armies were not so well prepared. However, as the war progressed, the combined weight of Alhed 1esources, which were speedily organized for war, began to tell Production in the farms, mines and factories of the Central Powers decreased as more and more workers entered the fighting armies Under the strain of providing for both their armies and their civilian populations, the Central Powers could not maintain the pace of production that the Albes had set. By the time the war had ended, it was clear that the ability of the Allies to produce more war materiel and move it faster was as much responsible for victory as were the efforts of their combat troops.

### WORLD WAR II

This conflict was also essentially a war of supply. The brilliant stategy of high commanders, the bold tactice of battle leaders, stall and courage of the fighting troops, all contributed to the final outcome; but vactory went to the nations who had best organised their total economic resources to produce the material of war and othe transport to move it, and fromes, to the world's battledge.

Logistical Preparedness for Wat.—Before war started on Sept. 1, 1939, with Germany's invasion of Poland, no nation even approached the state of economic and industrial preparedness for war that was to be required later. Under Hiller's leadership, Germany had steepped up production for war ance 1933 and was much stronge militarily than its neighbours by 1939. It industry and scientists had developed synthetic rubber and gasoline and had built plants to produce both these important war materials in which Germany was deficient. The extent of economic mobilization in 1939, however, was exaggerated; only on the eve of Germany's attack on Poland was there such a tlung as a multary procurement program worked out for a period as long as two years. Germany was not prepared for a long, sustained war.

Italy, unlike its ally, did not possess the economic resources necessary for even a short war involving a large-scale military effort—as the Italian general staff had informed Benito Mussolim prior to World War II This became apparent early when Italy's nability to supply its army invading Greece in the autumn of 1940 contributed heavily to the defeat of that efforts.

When Japan struck at Pearl Harbor, it was ostensibly well prepared for war Its merchant fleet was the third largest in the world and it possessed the world's third largest navy. In Japan proper, in Manchuria and in Korea were highly developed systems of railroads Japan had the industrial potential of Manchuria to supplement its home industries, which were harnessed to support the military effort For years it had exported the products of a flourishing textile industry-often at the expense of the civilian population which needed these products-in order to import scrap iron, oil and machinery required for war production. There was clear evidence, however, that Japan's estimate of the quantity and type of equipment and supplies required to prosecute a major modern war was based largely on its experiences in the Russo-Japanese and Sino-Japanese wars, and influenced only to a small extent by the experiences of the major powers in World War I and in the early phases of World War II. Throughout World War II, the Japanese high command was to display a surprising disregard for the logistical aspects of war. In this connection, a statement made by Gen. Toshio Nishimura, assistant chief of staff to Gen. Tomoyuki Yamashita, was significant. "In our army," he said, "the officers do not like to study logistics-it does not interest them-they want to study only how to fight. Even in the military academy it is difficult to get the cadets to study logistics."

Although the axis nations had apparently not visualized the U.S. found itself worfully short of equipment for the expanding scope of the supply and transport requirements which Word military establishment. Meanwhile, the demands of France and War II would entail, their state of military establishments when while the demands of France and War II would entail, their state of military preparedness was Great Britain for military matériel were swamping a small municalizary superior to that of the Allies who had done little to ready tions industry As this minustry expanded, it became apparent their economies for war. The U.S.S., however, was an exception of the property of the state of the s

both multially and economically for the impending conflict Following the advice of Nicola Lenin, the sovet leaders had created a large army with modern equipment. Moreover, through a series of twy year plans, they had built a sturdy heavy industry for the acknowledged purpose of providing a broad economic base for war—in addition to manufacturing the implements of peace. The agricultural machinery industry, for instance, built tractors needed for Russan collectivized farms, but these factories were enably converted to manufacture tanks. Aided by foreign capital and etchnical assistance, the US SR had also developed an arreaft and automobile industry necessary in providing transport for a modern army

More important yet, Russan leaders in the early 1930s had started to build up huge industrial centres beyond the Ural mountains which could function undisturbed during an enemy attack on the western USSR When Germany invaded the USSR, the Wehrmacht faced armes supplied by a civilian industry disposed in depth. The power of later soviet counteroffensives made by armes equipped with excellent tanks, planes and impressive numbers of artillery pieces was ample proof of the effectiveness of the USSR's war industry.

Meanwhile, the Red army was handicapped by deficiencies in the soviet transportation system. Roadnets in the USSR were not well developed, and the railway system had not kept pace with the industrialization of the country. In addition to supplying the amed forces, the railways were also needed to move dismantled factories eastward before advancing Germans. This was a serious strain upon the soviet railroad system, especially during the early stages of the war. Another transportation deficiency was the lack of merchant ships. Unlike Britain, the USS. R. could not dispatch fleets of supply vessels to Allied countries to pick up supplies which it lacked

The other major Alhed countries, Great Britain, France and the United States, had done little to prepare their economies for war prior to its outbreak. France had recognized the importance of total economic preparation for war in the Defense law of 1948 which provided for a minister of armaments. However, little or nothing had actually been accomplished in the way of economic mobilization when Germany struck. France depended more on the Maginot line and on manpower than on its military equipment, much of which was sesentially of World War I type

The general staff of the French army had prepared an elaborate supply plan to support field armies in a theatre of operations which was expected to be in northeastern France. This plan, however, was based on archaic World War I principles and was highly inflexible. It provided for supply concentrations in expected areas of battle operations and depended almost entirely or railroads to the exclusion of motor transport. It was to prove incapable of supporting field armies matched against highly mobile German forces.

Great Britain was similarly unprepared. Not until a month before Poland was invaded dut he Britais creat the minustry of suply, which was to be their major national co-ordinating agency for evuilian and military supples. The royal navy, of course, su superior to any that the axis nations could assemble, and the royal air force had ewe and modern planes. The British army, howers, lacked adequate modern equipment. Transportation was a major factor in the British supply scheme since much of the needed war matérial had to come from member nations of the British empire and later, through lend-lease, from the United States.

Like France, the United States had long recognized the principle of industrial mobilization for war. As early as 1922, the navy and the war department had planned for such mobilization through the medium of the army and navy munitions board. Lack of funds, however, prevented adequate measures for preparedness When World War II started in Burope in 1939, the U.S. found itself woefully short of equipment for the expanding military stablishment. Meanwhile, the demands of France and Great Bertain for military matériel were swamping a small munitions industry. As this industry expanded, it became apparent that a system of allocating the nation's materials to industry would have to be instituted; otherwise the country forced the

threat of uncontrolled competition among the various procuring agencies that had characterized 1917 procurement efforts. After several national agencies with limited authority had been created to supervise allocation, the War Production board was organized in Jan 1942 as the major co-ordinator of industry for the national defense program. In March of the same year, the army service forces, at first called the services of supply, was organized to coordinate the administrative, supply (including procurement) and service activities for the war department as a whole.

Early Phases of the War in the West,-In May 1040 England, France, Belgium and the Netherlands had troops on the continent with total numbers exceeding those of Germany Imtial superiority in transport and supply organization, as well as the tactical aggressiveness of the German armies, however, enabled Germany to defeat them with ease Less than a year after France had fallen, the Wehrmacht was driving deep into the USSR and in early 1042, the Afrika Korbs was threatening the Suez canal

At this time, however, Allied resistance began to stiffen, and the German field armies began to feel the effects of overstretched supply lines and the weaknesses of a supply policy designed primarily for short campaigns In an effort to pour as many new combat units into the field as possible and thus ensure quick victories. Adolf Hitler had insisted that 90% of newly produced equipment should be furnished to newly activated combat units The shortsightedness of this policy in a sustained war became apparent as the lack of replacements for worn, damaged or captured equipment impaired the efficiency of fighting units

which had been in combat for long periods

Preparing for the long war which they knew lay ahead of them, Britain and the United States started to build up the armies and the tremendous amounts of supplies and transport needed for a major offensive. Meanwhile, they launched smallerscale offensives in North Africa, Sicily and Italy. After the strength of the German eastward drives in the U.S.S.R. had been spent. Russian armies, supplied mostly by their factories beyond the Urals, mounted a large-scale counteroffensive

Logistical Aspects of Campaigns in the West.-In 1042. the British and Americans were considering a cross-channel invasion of France from England to aid the hard-pressed Russians The Alhes, however, lacked the large numbers of invasion craft and the supplies and troops needed to make such an assault and

thereafter to sustain an offensive Accordingly, it was decided to invade North Africa.

North Africa -The U.S. army service forces had built up enough matériel in the United Kingdom to equip the U S. troops there who were to invade Africa. However, they had transported combat units to England at the expense of enough service units to store and catalogue this equipment adequately. As a result much of the materiel could not be readily located, and duplicate shipments from the United States became necessary. This experience provided an object lesson to the U S. army, which thereafter attempted always to provide service troops commensurate with the amounts of supplies they were required to handle.

After North Africa had been invaded successfully, the transport factor immediately assumed importance in subsequent operations. Allied forces rushing eastward toward Tunisia soon outraced their supply support. Railroads along the North African coast line were single-track and had little usable rolling stock. Roads were poor and the Allies lacked adequate motor transportation As a result, the defeat of axis forces was delayed

Sicily.-One of the major factors influencing the Allied decision to attack Sicily was the desire to gain additional protection for the Allied supply life line through the Mediterranean to the Suez canal. The spectacular speed with which the Allies overran Sicily resulted in minimum losses of supplies. As a result, there was considerable excess equipment in North Africa and Sicily available for later assaults in Italy.

Tialy.-It was political and operational factors, rather than logistical factors, that in the main determined the Allied decision to invade Italy. Italy was not self-sufficient and the Allies were obliged to ship coal, food and clothing for the Italian people in addition to supplies for their armies in Italy. The narrow front

in the Italian peninsula made it difficult for the Allies to get behind the Germans to cut lines of communication Mountainous terrain and an inadequate road net hindered service forces supplying combat troops

Western Europe -Logistical considerations had played a major role in the decision to attack Festure Europa from Great Britain The United Kingdom provided a ready-made base of operations with modern transport and cargo facilities located only a few miles from the enemy While conducting their operations in the Mediterranean, the Allies had continued to build up troops and equipment for Operation "Overlord," the cross-channel invasion To keep British ports operating at full capacity, the United States preshipped equipment to the United Kingdom for the use of combat troops who followed later In the year preceding the invasion, the US preshipped a total of 5,530,000 measurement tons of such equipment and supplies During the same period 1,600,000 men were moved into the United Kingdom

The problem of moving supplies across the beaches to sustain the divisions employed in Operation "Overlord" was particularly difficult. Pending the seizure of French ports capable of handling large quantities of supplies, artificial harbours were built to be

used at assault beaches

In the Allied race across France following the Normandy invasion, supply lines stretched nearly to a breaking point Lack of adequate supplies, especially gasoline, caused the combat units pursuing retreating German armies to halt. Not until the Alhes captured Antwerp, Belgium, a port closer to their forward fighting elements, were the supply forces able to provide the masses of material needed to continue the plunge across the Rhine into the heart of Germany

Two months after the Normandy assault, the Allies' landing in southern France gave them the ports of Marseille and Toulon thus relieving some of the pressure on the congested channel ports of France. It also enabled the Allies to use the north-south railroad and road nets in France to supplement the congested east-west highways and railroads in northern France.

As this tremendous logistical build-up of the Allies increased, Germany could not keep pace The basic reason for this was that Germany had not mobilized its economy as effectively as had the Allies for war. In 1944, for example, only about one-third of all German output went for direct war purposes, whereas 40% of US production effort at the height of the war was used for implements of war. At one time, the percentage of British war production to total production may have gone as high as 45%. As Allied strategic bombing mounted in intensity, German transportation and industry suffered Faced with the crushing weight of Alhed matériel from east and west, its armies succumbed

Campaigns in the East,-Japanese strategy from 1932 onward was aimed at denying Chinese armies the support of the industrial areas of Manchuria, and China itself. Concurrently. Japanese armies attempted to starve China into submission by seizing agricultural areas or by making periodic forays in strength to confiscate or destroy harvests

In Dec. 1941 and Jan. 1942 the Japanese seized the ports of southern China, thus denying the shipment of Alhed supplies to poorly equipped Chinese armies In March 1942 the Japanese capture of Rangoon closed the Burma road, by which Allied supplies had been carried overland to the interior of China. Only by air shipment over the Himalaya (the "Hump") could supplies then be delivered. Planes, however, could not carry heavy construction machinery and fighting equipment, or adequate amounts of the supplies needed by Chinese armies. Accordingly, the Allies began the herculean task of constructing the Ledo road with parallel pipe lines through almost trackless wastes from Assam, India, to a point on the Burma-China border where the new road could link up with the portion of the old Burma road not controlled by the Japanese. Meanwhile, the Allies still had to get supplies from the supply base at Calcutta to the beginning of the Ledo road in Assam This necessitated the improvement of railroads and barge lines between these two points.

The rough terrain and lack of existing means of ground transport forced British and U.S. troops operating in the China-BurmaIndia theatre to rely on planes alone to move and supply them on many occasions

"Pacific Campaigns—Early in the war, the United States had decided to contain the Japanese advance in the Pacific while making the major effort against the ans in the European theatre Transportation was an important factor influencing the formulation of this strategic decision. The United States lacked enough shipping to move the troops and supplies required for powerful concurrent offensives in both the Pacific and Europe—and distances to Pacific fighting fronts were almost twice as far from U.S. supply bases.

supply oases.

While committed to a strategic defense in the Pacific, the United States launched limited offensives to seize advance bases for air and logistic support of later offensives in strength. The objective of the 1942 campaign in New Guinea was to shorten supply lines by establishing major bases along the New Guinea coast to support future operations. The primary reason for the assault on Guadalcanal was to seize a forward air base. The U.S. also built up supplies at such bases as New Caledonia, Espiritti Santo and Guadalcanal, so that by June 1943 there was sufficient strength for further attacks in the Solomons, The "shand-hopping" technique employed in the South Pacific consisted of amphibitious landings on shores that were trackless jumgles. Such operations required a rapid build-up of supplies for fighting troops and the speedy construction of roads and artifields by specially trained and equipode denineer units.

Meanwhile, the by-passing of islands by amphibious U.S. forces made the enemy-held garrsons liabilities rather than assets to Japan Cut off by U.S. submarine, surface and air blockade, Japanese troops could not be supplied and reinforced and rapidly lost their potentialities as combat forces.

By the summer of 1945 operations in the Mediterranean had stabilized sufficiently to release some shipping for other uses. These ships, along with large numbers of new ships produced by an accelerated construction program, were then available to carry large numbers of troops and supplies to the Pacific from the west coast of the United States or from the base facilities which had been developed in Hawaii. In accordance with long-range plans developed by the US army and anays, supplies and troops were moved to take part in the long-awaited major offensive in the central Pacific.

By mid-roa4 the joint chiefs of staff of the US, armed forces began to make detailed strategic plans for the seizure of the Philippine Islands to be used as bases for the eventual assault on Japan tself. There had been some question as to whether it was preferable to attack Formosa rather than Luxon in the Philippines for use as a major base Here again the logistical factor decided the question. The army service forces, which had made logistical studies of the Philippine Islands as early as 1944, declared that Luxon, with its superior ports, road nets and afrield fachties, would provide the better base. Accordingly, operational plans in line with the recommendation of the army service forces were adouted

In addition to the Allied offensive, there were two important logistical factors which contributed to the final Japanese capitulation in Aug. 1945. In the latter phases of the war, Japanese troops became deficient in almost all classes of supplies and equipment because of madequate home production and inability to transport war supplies and redinforcements to the far-fung garrisons in the areas they had conquered, especially after the Alles had secured air and sea superiority in the Pacific and secured air and sea superiority in the Pacific secured.

#### KOREAN WAR

Millary transport assumed a dominant role at the very outset, of the Korean war when it became obvious that without immediate reinforcement the Republic of Korea army was doomed. Troop transport planes of the United States air force ferried an understrength infantry battalion to Pusan less than 12 hours after the decision had been made to commit United States troops in Korea. Seaborne units followed rapidly.

As the fighting progressed, superior transport enabled outnumbered United Nations ground forces to hold the enemy and then counterattack Lacking adequate reserves during the defense of the Pusan bridgehead, the 8th army used trucks to shuttle ground units quickly from one threatened sector to another. Superior sea transport permitted UN troops to make an amphibious landge at Inchon on Sept 15, 1950, and to help support logistically a subsequent offensive that virtually destroyed the Korean Communist army.

By contrast, lack of adequate transport hampered the Chinese communists when they entered the war. After an offensive, the Chinese were obliged to halt for long periods while they moved up ammunition, equipment and food by oxcart, porters and a minted number of motor vehicles and railroad cars. Attacks by United Nations aeroplanes further complicated Chinese resupply and reinforcement. Thus delayed, the Chinese could not exploit their initial successes against an overettended but more mobile.

8th arms.

The United States assumed the major responsibility for funminising and transporting military supplies to United Nations forces in Korea. To fight a war 6,000 mi, from its shores, the United States expanded rapidly a military transport system organized after World War II. In 1949 the United States navy's Military Sea. Transportation service (MSTS) had assumed responsibility for all ocean shipping. From June 25 to July 31, 2950, the MSTS moved 4,000 me, 500,000 measurement tons of cargo, and more than 2,000,000 barrels of petroleum to the far east. The United States Military Air Transport service (MATS), operated under control of the air force but manufol jointly with air force and navy personnel, had been established in 1948. In any from the United States the Japan. Five weeks later, the Pacific air lift had increased its pre-Korean tonnage by 3,000%.

Pusa provided a major port for United Nations forces. Despite shortages of expensenced labourers, limited port and dock facilities and antiquated Korean equipment at Pusan, the United States army's transportation corps organized thousands of Korean stevedores and unloaded 300,000 tons of cargo at this port during July 1950 along

Kortes's roadnet was limited and primitive. To supply United Nations troops in positions distant from usable roads, the Republic of Korea formed the civilian transportation corps. This organization, later integrated into the Korean services corps, furnished thousands of porters who carried ammunition and supplies to the most forward infantry units. The military helicopier also proved invaluable as a means of supplying combat units in in-accessible locations and evacuating wounded.

Japan, with its excellent ports, rail and roadnet, provided a superb supply base close to the Korean battfeground However, United States army divisions in Japan at the outbreak of the Korean war were organized for occupation and lacked much of the combat equipment they required, especially tanks, motor vehicles and anti-tank weapons. This equipment was rushed from the United States. At the same time the United States army instituted an extensive reclamation and rebuilding program to salvage thousands of motor vehicles and other equipment left on Pradic islands after World War II. The rapid redeployment of troops is always the control of the program of the same program of the sa

When the Korean war brought audden demands for additional stipping, the United States navy took about 2,000 ships of all types out of "moth balls," The United States air force, experiening smilar problems in obtaining additional equipment rapidly, employed some commercial transport planes to help overcome shortages.

The Korean war again emphasized the critical importance of military supply and transport in modern warfare. In the first four months of this war, the United States shipped more men and equipment to Korea than it did to North Africa. Ir months after Pearl Harbor. Better supplied and better transported, outnumbered United Nations forces were able to defend the Republic of Korea with conspicuous success.

## MODERN MILITARY ORGANIZATION FOR SUPPLY

The supply services of a modern army are organized usually on a service, territorial and command basis

Service Organization .- Specialized military supply functions are assigned to various vertical organizations within an army which have staff officer representatives at nearly all echelons of army command In the United States army, for instance, the quartermaster corps has the special function of providing food and other supplies to the troops. There are quartermaster officers at levels from the division upward to perform this function. In addition to this staff organization, a service maintains troop units to perform the actual operations with which it is charged Many of the services also maintain combat type units which handle special equipment of the service in battle

Organization varies among armies, but the technical services of the United States aimy are typical. These services determine army requirements for the supplies in categories under their supervision and then procure, store and issue them They also perform maintenance and other duties Technical services, along with typical supplies which they handle and typical specialized duties which they perform, follow

Chemical Corps - Typical supplies which this service handles are smoke-producing equipment, bulk chemicals (toxic and nontoxic), flame-throwers, gas masks and decontaminating equip-ment Typical services performed are decontamination of equipment, training of troops in gas warfare and maintenance of chemical depots.

Engineer Corps -This service is responsible for such supplies and equipment as bridges, construction materials of all kinds, assault boats and maps. Among the services performed by engineer troops are the construction and maintenance of structures of various types, the clearing and operation of ports, surveying, mapping and reproduction of maps and the furnishing of electrical power

Medical Service,-Medical supplies include instruments, drugs, plasma and therapeutic apparatus. The medical corps treats the sick and wounded and supervises measures taken by troops to maintain health

Ordnance Corbs -This service handles most of the weapons. ammunition and motor vehicles used by the U.S. army Ordnance troops help service this equipment.

Quartermaster Corps -Food, clothing and gasoline are three of the major items which this service supplies. Among the services it performs are the operation of laundry and dry-cleaning facilities and graves registration.

Signal Corps,-Telephones, wire, radios, public address systems and photographic equipment are typical of the supplies for which the signal corps is responsible Signal units install and repair communication facilities of various kinds, and take and develop photographs.

Transportation Corps .- This service handles railway and certain types of floating equipment Its services include transportation of personnel and property of the U.S. army

Territorial Organization .- A theatre of war includes all the sea, air and land masses which are actually involved, or which may become involved in a war. The actual fighting takes place in only a small portion of the theatre. The remainder is filled with combat troops preparing for or moving to battle and the numerous supply agencies which operate the lines of communication . For operations, these supply agencies are frequently placed under area commands which co-ordinate their efforts There are such territorial supply commands in two of the major subdivisions of a theatre of war-the zone of the interior and the theatres of operations.

Zone of the Interior .- This area ordinarily includes all the territory of a nation exclusive of the theatres of operations. It may, under some circumstances, also include foreign territory, either allied, neutral or hostile. Within the zone of the interior is a major supply organization or group of organizations which co-ordinate the funnelling of troops and supplies to the theatres of operations,

the theatre of war necessary for tactical operations and for administration incident to these operations. Although there is no rigid organization of a theatre of operations, it normally contains a combat zone and a communications zone

The combat zone comprises the land, sea and air masses required for combat operations and for the immediate administration of the combat units operating therein. The combat zone is divided normally into army areas which are in turn divided into corps and division areas. In a normal situation, an army within the combat zone will designate an aimy service area which extends from the corps rear boundaries to the combat zone rear boundary In the army service area, supply and service units, organic or attached to the army, operate These units may, however, be located anywhere throughout the combat zone, including territory under the control of subordinate commanders. In a sense, the army service area is the communications zone of the army, providing a logistic link between the army and the theatre communications zone

The communications zone includes all the territory of the theatre of operations between the rear boundary of the theatre and the rear boundary of the combat zone. It provides space in which administrative units, including supply and transport agencies, function in support of the fighting units in the combat zone The communications zone is a link between the zone of the interior and the combat zone. It is established primarily to free combat commanders of such responsibilities as supply and administration of territory not directly concerned with combat For this reason, the communications zone is constantly pushed forward as the fighting troops advance. When practicable, the communications zone operates as a single unit, however, factors such as the territorial extent of the zone, enemy activity or the volume of support operations may necessitate decentralization of the zone into base sections and advance sections In such a situation, the base section is normally closer to the zone of the interior while the advance section provides the link between the combat zone and the base section The nature of combat operations and other special conditions determine the type of organization After the establishment of a beach head on a hostile shore, for example, all service units supporting an army might be pooled into an army service command under direct control of the army commander As more territory is gained, the army service command might be dissolved and an army service area and an army base established A final step might occur when the communications zone of an advance section of the communications zone takes over this army base

Command Organization.-In most multary commands, whether large or small, commanders are responsible for the immediate supply and transport of their subordinate units theatre commander, for example, is responsible for the distribution of supplies and transportation to the army, navy and air theatre commands An infantry regimental commander is likewise responsible for providing his battalions and companies with supplies and the vehicles needed to move them

Each commander has a staff or its equivalent to assist him in discharging this responsibility. In the U.S. army, the assistant chief of staff G-4, or his counterpart in a larger or smaller unit. is responsible for supply planning and the supervision of supply operations. The G-4 also handles transportation for administrative moves of the command The assistant chief of staff G-3 (plans and operations officer) supervises the transportation in combat operations

# SUPPLY OPERATIONS

On every level of command there must be a close haison between the unit commander and his supply services in order that adequate supplies will be available at the time and place needed to support tactical operations. Because there is a time lag between requisitions for supplies and their airival, all commanders must inform supply agencies of planned operations as early as

Supply Requirements.-This is a statement of all the sup-Theatre of Operations.-This area includes that portion of plies needed by a military organization over a specified period of time or to complete a particular project Requirements for an organization may include

Initial Equipment Requirements—This is the equipment which a unit, such as one recently mobilized, needs in its initial issue Replacement and Consumption Requirements—A unit needs issue of expedience and consumption of the 
issues of supplies to replace items worn out, destroyed or consumed

\*Reserve Requirements\*—Units are authorized to keep reserves

of equipment and supplies which they need in case normal resupply channels are interrupted

Project Requirements —A unit has requirements for supplies not included in normal allowances when it is given a special operation to perform

Levels of Supply—Supplies are not pumped into a theatre at an absolutely uniform rate because of enemy interruptions of the supply lines and the imperfections of even the best transportation system. In order, therefore, to maintain a continuity of operations a theatre is authorized to maintain levels of supply. These are quantities of supplies, usually expressed in days, which it keeps on hand for future needs. In turn, the theatre authorizes its subordinate commands to maintain levels of supply which units procure by requisition on higher headquarters.

Procurement.—A theatre of operations obtains the supplies it needs by shipment from sources such as the zone of the interior lying outside the theatre, or by exploitation of resources within the theatre

Supply from Zone of the Interior—When a multary force minitates a campaign that establishes a theatre of operations, it takes with it its initial equipment and supplies for replacement and maintenance for a specified period of time As the campaign progresses, it receives an automatic issue of supplies from the zone of the interior on a prearranged schedule, based on autoripated needs. Later, as the theatre becomes organized, it can calculate more realistically its own supply needs, it then starts to requisition supplies from the zone of the interior based on its actual experiences and the automatic issue eventually ceases.

Supply from Local Resources—Military forces habitually utilize local resources when possible to avoid the shipment of similar materials from distant multary supply bases. When in allied areas, arrangements are made with the friendly government to obtain supplies and services needed. In hostile territory, troops may procure supplies by purches, requisition, contributions or confusation. In any case, the theatre commander prescribes the procedure by which subordinate beautiful to the procedure of the subordinate beautiful to the subordinate law, rules of land warfate and regulations of higher authority. Any sensure of property not so authorized is pumbabble as looting.

Supply through Repair and Recovery—In battle, much equipment and many supplies are shandoned, lost or damaged either through emeny action or through madequate mantenance. Energetic efforts to collect the cupment which is attern over any battlefield and to salvage damaged material greatly case the strain on the supply system which must furnish replacements for lost or destroyed equipment. Every individual in an army is responsible for the recovery of sulvegachel supplies. When deemed appropriate, combat troops are often used to collect recoverable equipment after fighting is over. Commanders are responsible for the mantenance of supply discipline in their units to keep the loss and wastage of supplies to a minmum.

In divisions and higher units organic service troops salvage equipment as a normal function. When possible, they restore damaged equipment so that it can be used for the purpose originally intended. When this is not possible, they may convert the equipment for some other use. Within the theatre, some service units have the sole mission of retrieving abandoned and damaged cumble, and excriments.

supplies and equipment.

Marking and Packaging.—In order that supplies may go through the long supply line to their proper destination without confusion, it is essential that they be properly marked. Markings generally include the destination, type of supply, method of shipment, weight and cubage and the period in which shipment is to be made. For security reasons, some of this information is

often in code.

Factors influencing the method used to package supplies include the need to conserve shipping space, protection against the elements and rough handling, and the fragility of the supplies Often it is necessary to package supplies in such a way that they can be dropped from planes or broken down easily into one-man lark.

Storage.—At various points in a military transportation system, supplies are stored in depots where they are entered on stock records and held for further movement or distribution to the units which use them. Depots may be classified as branch depots (such as quatermaster or engineer services) according to the service which maintains them. Although general depots (which stock supplies used by two or more depots). Are sometimes organized, branch depots are the type more often used. Depots may also be classified according to the type of supply they handle

Within the communications zone is an elaborate depot system for storing supplies for further tunsportation. Within the combat zone are army depots from which are funnelled supplies to army railheads, truckheads or anwigation heads, where distribution to troops is accomplished. A dominant factor in the selection of depot states is proximity to means of transportation.

Distribution.—Distribution in a military sense includes all the operations incident to the movement of supplies within a command A distribution system must be flexible to ensure the adequate supply of troops in spite of rapid changes in the tactical substance.

Within a theatre of operations, the first step in the distribution process is usually the movement of supplies from ports to deposit within the communications zone. Such movement must be carefully controlled and expected to avoid port congestion. After the supplies are classified and picked up on stock records in these untial depots, they start through the chain of depots that store them until they are distributed to user agencies.

There are two general methods employed to distribute supplies to user organizations distinguished by the point at which supplies are delivered to them.

Supply Point Distribution—In this method, delivery of supplies is made by the supply agency of a higher echelon to a supplionit established by subordinate units. The units which are to use the supplies employ their own transportation to pick up these supplies.

Unit Distribution —Under this system, the higher echelon provides the transportation to haul the supplies directly to the bivouac areas of subordinate units or to some similar point of easy access

In the U.S. army, field armies and divisions ordinarily employ the supply point distribution method, while regiments use the unit distribution method.

### TRANSPORT ORGANIZATION

Nearly all units in an army are assigned means of transport on a more or less permanen basis—the units' organic transportation." Meanwhile, higher echelons may allocate additional transport to subordinate units when the occasion demands. A field army, for example, might assign additional truck companies to a corps when the corps's mission requires additional mobility.

In field armies, communications zone sections and in higher echolons, a transportation service is organized. This service has technical supervision over the transportation assigned to its own echelon and to subordinate echelons. It co-ordinates and court trols administrative moves made by means of this transportation.

Just as depots must be established for the assembling and storage of supplies as they move along the lines of communcation, so must "staging areas" be maintained to accummodate most expension of the supplies areas, established and maintained by the transportation service, are usually near normal stopping points such as rail terminals, articleds or highways. Staging areas vary in size and the number of facilities such as shelter, mess, supply and medical services which they provide.

Shipment by Water .- Ocean shipping used by military forces

may include troopships, troop-cargo ships, cargo ships and tankers These may be owned and operated by the military services or leased from civilian agencies A theatre commander has complete control over shipping allocated for intratheatre use Furthermore, he may direct shipping from the zone of the interior to unloading points in accordance with operational needs

Ports.-These include both ports of embarkation and debarkation Sometimes a port may serve both purposes Ports are operated by an organization responsible for conducting the operations incident to moving troops and supplies A typical organization of this type includes a headquarters and operational units such as truck or car units, port battalions, rail units and ship repair units

Beaches .- When ports are not available, or their facilities are madequate or damaged, beaches are frequently used to unload troops and supplies. Such an operation is complex and involves the use of specially trained units and special equipment

Highway Transport.—Militarily, this term includes trucks, buses, passenger cars and other miscellaneous vehicles intended to haul cargo and personnel over highways, roads and streets

Traffic Control .- Within the logistics section of each US army division, corps, army or other higher headquarters, there is a traffic headquarters which determines the capabilities of highways to support vehicular traffic and the maintenance and improvement which they need. This headquarters also makes plans for co-ordinating and controlling troop and supply movements by road Military police and designated personnel of units moving by motor convoy execute these plans The planning and supervision of motor moves in combat situations is accomplished by the operations officer of a unit

Cross-Country Transport.-The movement of personnel and supplies cross-country may be accomplished by vehicles, narrowgauge railways, aerial tramways, animals or men. Cross-country vehicles include such specially designed equipment as tracked and amphibious vehicles.

Railways.-When they are available, railroads form the backbone of the transportation system in a theatre of operations. A military railway system established by the U.S army is similar to its civilian counterpart. For maintenance and operation, the system is divided into a number of railway divisions, each under the control of a division superintendent. A railway operating battahon is assigned to a division. A grand division comprises usually from two to four of these operating battalions along with necessary shop battalions. The military railway service, headed by a general manager, is made up of one or more railway grand divisions

The general manager of a military railway service supervises operation throughout the communication zone and within the combat zone to the forward limit of rail traffic Commanders of ports, depots, railheads or other supply points are responsible for loading and unloading cars.

Pipe Lines .- When terrain is too rugged for other means of transport, or when road and rail capacity in an area is limited and traffic is heavy, pipe lines are often used to transport, distribute and store bulk liquids.

Air Transport.-In World War II, Germany, Great Britain and the United States made extensive use of transport planes, not only to move men and supplies administratively, but also to carry fighting troops which made assault landings from the air. In May 1941 German air-borne forces seized Crete. The Allies employed an air-borne corps in the Normandy invasion, during the extension of their northern flank in the Netherlands, and in the Rhine crossing. In the latter operation, the 18th air-borne corps's transport planes and gliders delivered a total of 17,122 troops 614 jeeps, 286 artillery pieces and mortars, plus hundreds of tons of gasoline; food and ammunition, to the corps air head in about two hours. After the war the Berlin "air lift, during which U.S. and British planes carried approximately 2,000,000 tons of supplies into blockaded Berlin and flew out more than 70,000 tons of cargo, furnished dramatic proof of the capabilities of air transport.

Advantages of air transport include the speed with which sup-

plies and men can be moved, unlimited choice of routes within aircraft range and freedom from ground obstacles to transport Disadvantages include the limits on the weight and bulk of equipment which planes can carry and weather restrictions on air travel Planes in the heavy transport class are further restricted by the limited number of fields on which they can land In wartime, transport planes are especially vulnerable to fighter planes and to anti-aircraft fire An air-borne operation into enemy territory requires surprise, air superiority, or both

The interest in air transport which the US army indicated during and after World War II was reflected in the postwar organization of both air-borne and standard infantry divisions The air-borne division acquired heavier equipment than its World War II counterpart to enable it to fight more sustained actions behind enemy lines Meanwhile, the standard infantry division's equipment was made lighter and less bulky, to facilitate movement by air

SUPRARENAL EXTRACT. In medicine, the sterilized glycerin extract of the suprarenal gland of the sheep, the dose being 5 to 15 minims The active principle adrenaline or epinephrine occurs only in the medulla of the gland It forms minute white crystals, soluble in weak solutions of hydrochloric acid, and is most frequently used in 1% solutions of the chloride

Adrenaline has no action on the unbroken skin, but applied to mucous membranes it causes blanching by stimulating the muscular fibres of the arterioles It acts rapidly in a similar manner when hypodermically injected The vessels of the uterus are strongly acted upon by it, but the effect on the cerebral vessels is slight, and the pulmonary vessels are unaffected. The heart is slowed and the systole increased. Adrenaline stimulates the salivary glands, produces a temporary glycosuria, and in poisonous doses causes haemorrhages in the viscera and oedema of the lungs.

In Addison's disease the use of suprarenal extract has been beneficial in some cases, but its chief use is in the control of haemorrhage For this purpose it is given in conjunction with local anaesthetics such as cocame in order to produce bloodless operations on the eye, nose and elsewhere. It is also useful in haemorrhage from small vessels, where it can be applied at the bleeding spot, as in epistaxis. In surgical shock and in chloroform syncope an injection of adrenaline often saves life through the rise of blood pressure produced. An attack of bronchial asthma may be cut short by a hypodermic injection of adrenaline solution should never be used in the treatment of haemoptysis. Similar commercial products on the market are hemisine, renaglandine. suprarenine, adnephrine, paranephrine and renostyptine Suprarenal snuff containing the dry extract with menthol and boric acid is of use in hay fever. Rhinodyne is of this type. Suppositories containing suprarenal extract are employed successfully to check bleeding piles

The chemistry of adrenaline has been mainly elucidated by the investigations of Pauly, Jowett and Bertrand; Jowett proposing a constitution (see annexed

HO HO Adrenaline renalme in increasing the blood

formula) now accepted as cor-CH(OH) CH, NHCH, rect Many substances having related constitutions have been synthesized, and resemble ad-

For example, the corresponding ketone, adrenalone (obtained in 1904 by Stolz), is active, and the methyl group can be replaced by hydrogen or another radical without destroying the activity. It seems that the parahydroxyl group is essential. For instance, parahydroxyphenylethylamine, HO CeH4CH2 CH2NH2, which is one of the active bases of ergot, closely resembles adrenalme (G. Barger, Journ. Chem. Soc., 1909, 95, pp. 1123, 1720; K. W. p 2193) Adrenaline is optically active, the naturally occurring isomer being the laevo form, like nicotine, the laevo base has a much greater physiological activity than the dextro. (See An-RENALINE )

SUPRARENALS: see Adrenal Glands.

SUPREME COURT OF JUDICATURE, in England, a court established by the Judicature act, 1873, consisting of the "court of appeal" and the "high court of justice." (See Court,

PRACTICE AND PROCEDURE )

SUPREME COURT OF THE UNITED STATES, THE. The supreme court of the United States occupies a unique role in the economic, political and social life of the country division of sovereign power between the federal government and the several states and the guarantees of the fundamental civil liberties of the individual against legislative encroachment by either federal or state governments demanded the establishment of an arbiter to adjust competing exercise of power between the states and between the states and the federal government and to protect individual citizens from any encroachment on their rights by either federal or state government The supreme court was established in response to this need It is one of the few among the high courts of the nations in the world which has and exercises the power to invalidate legislative enactments of both federal and state governments which are deemed contrary to the fundamental law of the land as it is expressed in the constitution-a power which is not expressly granted in the constitution but which it assumed by virtue of its interpretation of that instrument. The constitutional provision establishing the court and defining its iurisdiction is contained in article iii, sections 1 and 2, which

The judicial power of the United States shall be vested in one Supreme Court, and in such micror Courts as the Congress may from and inferior Courts as the Congress may from and inferior Courts, shall hold there offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be dimnished during their Continuour in Office The judicial Power shall extend to all Cases, in Law and Equity, arsing under the Constitution, the Laws of the United States, and

aransg under taus Constitution, the Laws of the United States, and Treates made, or which shall be made, under thet Authority,—in all Cases affecting Ambassadors, other public Ministers and Consuls,—to to which the United States shall be a Party,—to Controversies between two or more States,—between a State and Cultiens of another States,—between cutterns of different States,—and the same State claiming Lands under Grants of different States, and between a State or the Cultiers thereof, and foreign States, Cultiens or the Cultiens thereof, and foreign States, Cultiens or the Cultiens thereof, and foreign States and Contients Subjects

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the Supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the Supreme Court shall have appellate Jurisdiction, both as to aw and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

Because of the fear of the states of encroachment by the court on their sovereignty, this original grant of jurisdiction to the supreme court was limited by the 11th amendment, which became effective on Feb. 7, 1795. This amendment is as follows:

The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State or by Citizens or subjects of any Foreign State.

While the jurisdiction of the supreme court is both original and appellate, it is only its original jurisdiction which is safeguarded by the constitution being limited to "all cases affecting Ambassadors, other public Ministers and Consuls" and those in which a state is suing either the federal government or another state. In all other cases, the court has such appellate jurisdiction as is conferred upon it by congress, which also sets up the various federal courts whose decisions shall be reviewed. Under the first Judiciary act passed on Sept. 24, 1789, congress provided for the establishment of the supreme court and of various inferior courts and provided in addition for appellate jurisdiction from the state courts in certain cases presenting federal questions. The extent of the court's appellate jurisdiction was subjected to various

Rosenmund, Ber, 1909, 42, p 4778), as does also its dimethyl de- changes which eventually crystallized in the Judiciary act of rivative, hordenine, an alkaloid found in barley (G Barger, ibid., 1925, at which time the court was granted a strictly limited appellate jurisdiction extending solely to cases involving constitutional questions and matters of national importance Thus the bulk of the court's work is confined to questions of public law and only in a comparatively few instances is it called upon to adjudicate private law disputes

The court as constituted in 1789 consisted of a chief justice and five associate judges. In 1807 the number was increased to six, in 1837 to eight and in 1863 to nine An act of 1866 would have reduced the associate justices to six, but before sufficient vacancies had occurred thus to reduce the court, the Act of 1869 was passed, which reconstituted the court with a chief justice and eight associate justices as it remains. To 1954 there had been 14 chief Justices 1 Although originally the chief justices were commissioned as "Chief Justice of the Supreme Court of the United States," in 1888 this title was changed simply to "Chief Justice of the United States"

The justices of the supreme court as well as all the federal judges are nominated by the president, confirmed by the senate and commissioned by the president Since the constitution does not prescribe the qualifications for holding judicial office, the president is left to his own discretion in the nomination of judges, as is the senate in its confirmation or rejection of his nominees Under the provisions of the constitution, in issuing the commission, however, the president exercises simply a ministerial power.

The term of the justices is during good behaviour, so that the term is for life unless a justice shall resign or by conviction on impeachment be expelled from office, as provided in section 4, article n, of the constitution. Only one justice of the supreme court has been impeached-Samuel Chase, who was acquitted in 1805 According to the latest revision of the United States judicial code at mid-20th century, a justice who has served for a period of ten years or more may resign or retire with pay upon reaching the age of 70.

In exercising its powers the court has generally been cognizant of its great responsibility. Thus, in determining issues of legislative constitutionality, the court has increasingly indicated its awareness of the importance of exercising judicial restraint Early in its history it refused to give advisory opinions on the constitutionality of legislation Later it sought to effectuate its policy of judicial self-restraint by rules which accord to legislation a presumption of constitutionality, which favour a construction of statutes so as to eliminate doubts as to their constitutionality, which enable the court to pass on constitutional issues only when essential to the determination of the case

However, the significance of the supreme court in US. life is derived not solely from its power to invalidate statutes, it comes also from its power to interpret the constitution, which can be said to be a necessary corollary of its judicial review function. In the exercise of this power the court has not felt obliged to exercise a similar self-restraint. It has by judicial construction determined that the individual fundamental liberties guaranteed by the constitution are not absolute but must yield to considerations of public policy as embraced in the police power of the state and federal governments to legislate for the general welfare. It has by this same interpretive power controlled not only the extent of social and economic legislation which could be enacted by state and federal governments, but also the relative powers of the state and federal governments to legislate in these fields. By its attitude as to the nature of its appellate jurisdiction, the court has exerted a direct influence on the growth of administrative bodies and on the significance of their existence as a "fourth branch" of the governmental process. While its decisions in these fields are of great significance, its work in the day-to-day adjustment of conflicts between the courts of the states, and between the lower federal courts sitting throughout the country. carries equal significance for the successful operation of the fed-

1 John Jay (1789-95); John Rulledge (1795); Oliver Ellsworth (1796-1800); John Marshall (1801-55); Roger Tanay (1856-64); Salmon P Chase (1866-72), M. R. Walte (1787-85); M. W. Fliller (1888-190); E. D. White (1910-17); William H Taff (1911-19); Charles E Hugges (1910-11); Harlan F, Stone (1944-40), Fred M. Vimon (1946-53); Earl Warren (1935-).

eral system of government established by the constitution.

Because of the power which the court wields, it has been subjected from time to time to considerable criticism especially in 1857 when the court decided in the Dred Scott case that congress had no power to abolish slavery in territories acquired after the formation of the national government, and more recently in the late 1030s when the court declared unconstitutional much of the early New Deal social and economic legislation Proposals for the court's abolition or for serious curtailment of its powers followed this criticism but failed of adoption, and, despite all attack, the court has generally held the confidence of the people The problems with which it has had to deal have involved the basic structure and development of the democratic system In resolving these problems, the court has of necessity been faced with the same fundamental question posed by Abraham Lincoln on the eve of the Civil War as to whether "a government must of necessity be too strong for the liberties of its own people or too weak to maintain its own existence."

SUQ-ASH-SHUYUKH, a town in Mesopotamia in 31° N and 46° 30° E. The town les on the lower Rupirates in a region which has probably always been of considerable fertility. There is communication with Basra by river and also by land routes, the railway lying a few miles to the southwest. The population is estimated at 12,000, most of whom are Arabs. The town is noted for the manufacture of the "aba," the woollen closek worn by the Mesopotamian Arab. There is also a good deal of local metal work and a host building industry. The town is 65 miles above Qurna by river but the channel has now ceased to carry much water and is almost unnavigable, except at highwater.

SURABAYA (Dutch Soerabaja), the chief port in Java, Netherlands Indies; population (1930), 341,675, including 25,900 Europeans. One of the most important centres of trade and commerce in the far east, Surabaya is situated in the east of Java, on Surabaya strait, which divides Java from Madura, thus securing the shelter of that island for its roadstead, while its position on the Kalı Mas, one of the mouths of the Brantas river, affords facility for transportation to the heart of the city. From the entrance to Surabaya the lofty ranges of the Tengger and Arjuna mountains are seen with Semeru, the highest active volcano in Java, in the far distance. A look-out station, Wilhelmina Tower, flanked by a small park is situated at the river's mouth and from here railway, steam tramway and road run mland, in a southerly direction; past the old Ft. Prins Hendrik, to, first the old town, then the upper town, and beyond that to the suburbs of Gubeng and Wonokromo, where a new residential and well-planned Surabaya has arisen Surabaya, the principal Dutch naval base in the East Indies, was captured by the Japanese March 10, 1942.

The naval station on the south side of the canalized Kali Mas. with the commercial docks opposite (destroyed by the Dutch during the Japanese invasion) consisted of an outer and inner naval basin, with torpedo boat harbour, dock-yards and cholera barracks. The commercial port consisted of breakwaters on the west side of the Kali Mas enclosing a harbour basin. Alongside the west pier of the basin was a wharf, 920 metres (Genoa Quay), and the Holland pier, 1,650 metres long. The eastern part of the basin was for lighters, and in the north-eastern corner there was a harbour for three floating docks of 14,000, 3,500 and 1,499 tons capacity, also, north of the Genoa Quay, a wharf for the tankers of the Standard Oil company. On the west border of the basin a shipping canal had been constructed, the Kali Perak, and the Kali Mas had been improved as much as possible by widening and the construction of stone walls along the banks. All quays and warehouses were connected by direct, wide roads and railways with industrial centres in the hinterland. Shipping traffic in 1939 was somosoco cu.ft, net,

Exports from Surabaya in 1939 were 62,767,000, and imports

103,944,000 guilders The bulk of the chief product of Java, sugar, is shipped from Surabaya, reduction in sugar cultivation after 1931 decreased the port's traffic It is also an important market for coffee, tobacco, maize and tapioca, while the Java hides are sold there chiefly There is steamer communication ordinarily, with the chief ports of the world and with most of the ports of the archipelago, Juigo on the main route from Singapore and Batavia to Australia, Surabaya also benefits from this traffic.

SIIRABAVA, a residency in the east of Java, Netherlands Indies, area, 1,658 sq mi , bounded on the north by the residency of Bodjonegoro, on the west by that of Kediri, on the south by that of Malang, and on the east by the straits of Madura Surabaya is one of the flattest residencies in Taya, well watered by the Solo and the Brantas, and possessing a climate admirably adapted for the cultivation of sugar, the chief product (210,oco metric tons in 1939), while tobacco, cassava (tapioca), maize, coffee, cocoa, are grown, and the usual native cropsrice, pulses, fruit and vegetables Cattle are bied extensively, forests in the western and Rembang portion yield quantities of teak (there is a central lumber vard at Chepu), and in this part too are extensive oil-fields with a large refining installation of the Royal Dutch-Shell company at Chepu The population (1930) was 2,176,423, including 30,708 Europeans and 64,175 Chinese and other foreign Asiatics The capital is Surabaya, pop. 341,675 (qv). Other towns are Grissee, 25 mi. N. of Sulabaya (pop. 25,621), a port of the old Dutch East India company and one of the first places of Dutch settlement in Java, where there is a trade in edible birds' nests; Mojokeito (pop. 23,600), a sugar industry centre, and the site of the Majapahit empire, with a museum of relics; Jumbang (pop 20,380), a sugar centre, and Sidoarjo The main railway line from Batavia crosses the residency, there are lines from Semarang to Surabaya city and thence to Pasuruan along the coast, and there is also excellent sea communication from the port of Surabava In 1618 the Dutch allied themselves with the Adipati of Surabaya, who favoured the Dutch against his overlord, the Sultan Ageng, and this helped to establish Dutch power in Surabava. The residency was occupied by Japan in March 1942

SURAJ-UD-DOWIAH (d 1757), ruler of Bengal. The date of his brit is uncertain, but is generally placed between 1729 and 1736. His name was Mirza Mohammed, and he succeeded his grandfather Aliverdi Khan as nawab of Bengal on April 9, 1756. He was a cruel and profligate fanatic. Benne offended with the English for givrup protection to a native official who had escaped with treasure from Dacca, he attacked and took Calcutta on June 20, 1736. He then permitted the massace known in history as "The Black Hole of Calcutta". (See Calcutta". History, and Indu. History) This attocolous act was soon averaged. Calcutta was retaken by Cilve and Admiral Watson on Jan. 2, 1757, and on June 23, Suraj-ud-Dowlah, routed at Plassey, fied to Rajmahal, where he was captured. He was put to death of July 4, 1757, at Murshidabad, by order of Miran, son of Mir Jafar, who had conspired against Suraj-ud-Dowlah.

SURAKARTA, a government of central Java. Netherlands Indies; area 2,31 sq.mi. It is extremely hilly, except along the valley of the Solo, the principal river, which, with its tributaries, the Kaduan, etc., so of great value to the residency for agricultural purposes, watering the rich volcanic soil brought down from the mountains which flank either side of the Solo valley from north to south, and making Surakarta one of the most fertile portions of Java.

In the west the mountains are dominated by the Merbabu and Merapi groups; in the east by the Lawu group Surakarta is bounded on the N. by Semarang, on the W by Kedur and Jokjakarta, on the E. by Madfun, and on the S., a very small portion of coastline, less than ten miles long, by the Indian ocean Surakarta is a -major tobacco-growing centre in Java; the production here is mainly on estates, producing leaf tobacco (9,933 metric tons in 10,30).

Sugar is also an important export commodity, there being (1939) nine estates producing 161,000 tons of sugar. The sugar

the Merapi mountain Coffee is a less important product. The government has also the usual native cultures-rice, pulses, cassava, fruits and vegetables. Pop (1930) 2,564,848 (6,555 Europeans and Eurasians), almost entirely Javanese

The susuhunan, or sultan of Surakarta resides in the capital. Surakarta, pop 165,484 (3,225 Europeans and Eurasians), also known as Solo where, too, is the headquarters of the Dutch Resident. Except in the oldest part of the town (where there is an old Dutch settlement, and Ft. Vastenburg, as well as the native quarter), there are fine, wide streets, well-planned and with magnificent shade trees at their side, with many modern shops and residential buildings. Surakarta has also a zoological garden. some very interesting houses of native nobles, and a large market The city is on the banks of the Solo, and also on the main railway line from Batavia to Surabaya, which crosses the residency in the centre, from west to east, and it is the staiting point of a line of railway to Semarang, via Gundih Tram lines run from Surakarta south to Baturetno and west to Boyolati, the starting-point for the ascent to the sanatorium of Selo, 4,500 ft., on Mt Merapi. The Dutch agreement of 1755 recognized two native rulers in Java, the sultan of Jokjakarta and the susuhunan of Surakarta From about 1830 onwards the native princes of Iava ceased to be of any political importance

The city and district were occupied by Japan in March 1942, during World War II.

See T. S. Raffles, History of Java (1817); M. L. van Deventer, Daendels-Raffles (London, 1894). (E. E. L.; X.)

SURAT, a city and district of India in the Northern division of Bombay The city is on the site where the English first established a factory on the mainland, and so planted the seed of the British empire in India. In 1514 the Portuguese traveller Barbosa described it as an important seaport, and during the reigns of Akbar, Jahangir and Shah Jahan it rose to be the chief commercial city of India. At the end of the 16th century the Portuguese were undisputed masters of the Surat seas. But in 1612 Captain Best, and after him Captain Downton, destroyed the Portuguese naval supremacy and made Surat the seat of a presidency under the English East India company, while the Dutch also founded a factory. In 1664 Sir George Oxenden bravely defended the factory against Sivan, but its prosperity received a fatal blow when Bombay was ceded to the company (1668) and shortly afterwards made the capital of the company's possessions and the chief seat of their trade. From that date also the city began to decline. At one time its population was estimated at 800,000, but by the middle of the 19th century the number had fallen to 80,000; in 1941 it had risen to 171,443. It is still of commercial importance. The city is on the left bank of the river Tapti, 14 mi. from its mouth, and has a station on the Bombay, Baroda and Central India railway, 167 mi. north of Bombay. A most and city wall indicate the dividing-line between the city, with its narrow streets and handsome houses, and the suburbs The city is a centre of trade and manufacture. There are cotton mills, factories for ginning and pressing cotton, ricecleaning mills and paper, ice and soap works. Fine cotton and silk goods are woven, and there are special manufactures of silk brocade, gold and silver wire, carpets, sandalwood and inlaid work.

DISTRICT OF SURAT has an area of 1,695 sq.mi.; pop. (1941) 881,058. It has a coast-line of 80 mi., consisting of a barren stretch; behind this is a rich, highly-cultivated plain, nearly 60 mi. in breadth, at the mouth of the Tapti, but narrowing to only 15 mi. in the southern part, and on the northeast are the wild hills and jungle of the Dangs. Principal crops are cotton, millets, rice and pulses. Chief centres of trade are Bulsar and Surat. The district is traversed by the main line of the Bombay, Baroda and Central India railway, with a branch along the Tapti valley to join the Great Indian Peninsula railway at Almaner.

The SURAT AGENCY consisted of three native states: Dharampur (q v.), Bansda (q.v.) and Sachin, together with the tract known as the Dangs, Sachin has an area of 42 sq.mi ; pop. (1931) 22,107. The Agency has been absorbed by the Revakantha Agency.

SURBITON, a municipal borough in the Kingston parlia-

cane is grown extensively on the volcanic ground at the foot of mentary division of Surrey, England, 12 mi. S of Waterloo, London; on the Southern railway. Pop. (1951) 60,675. Area, 7.3 sq mi It has a frontage upon the right bank of the Thames opposite to Hamptom Court. The district is largely residential for people working in London. A public library was opened in 1932 and the county school for boys in 1925 Hillcroft college provides a one-year course of residential non-vocational education for working women from all parts of the country and from every trade. Surbiton was incorporated in 1936.

SURETY, in law, the party liable under a contract of guarantee (q v.). In criminal practice sureties bound by recognizance are means of obtaining compliance with the order of a court of justice, to keep peace or otherwise. (See PRINCIPAL AND AGENT )

SURFACE. There is no agreed definition of a surface may think of it as the boundary of a solid body, or as the division between two portions of space, or as the locus of an co2 set of points, selected by some law from the co3 points of space, and having a certain amount of continuity; in each case a plane is the simplest example, but none of these gives a precise or satisfactory definition. A very simple model illustrates the kind of difficulty that arises. If a surface partitions space, it must have two sides; but a long strip of paper, with the ends joined after one has received a half-twist, forms a surface with only one side.

At an ordinary point O of a surface, there exists a taneent plane, the unique limit of the plane OPO, when the adjacent points  $P,Q \rightarrow 0$  by any paths lying on the surface, the angle POQremaining finite. Any point where this limit does not exist is singular. The normal is the perpendicular to the tangent plane at its point of contact O.

A surface can also be regarded as the locus of a point satisfying a geometrical condition expressed by a single equation between its rectangular cartesian co-ordinates, say f(x, y, z) = 0. From this point of view, the definition of a surface depends on what types of function are admissible for f, and the question of continuity arises in another form. The surface is analytic if f is an analytic function, and in particular is algebraic if f is a polynomial. shall use f as the name of the surface whose equation is f=0.

We may also consider a surface as the locus of a curve varying according to some definite law Thus a sphere is the locus of a meridian circle which rotates about the polar axis, or of a circle of latitude whose centre advances along the axis, while the radius first increases from zero and then decreases. Any surface can be thus regarded, for it is always the locus of its own sections by a fixed pencil of planes.

In particular, a ruled surface is the locus of a variable line, whose different positions are the generators. The tangent plane at any point on a generator contains the whole generator. alternative situations can arise, the plane may touch the surface all along the generator, or it may vary in a pencil (rotating about the generator) as the point of contact moves along the generator. If every generator is of the former kind, the surface is a developable. Such a surface has only on tangent planes, one for each generator, whereas the general ruled (or nonruled) surface has \$\infty\$2 tangent planes in accordance with the principle of duality The simplest developables are cones and cylinders. Like them, any developable can be flattened out or "developed" into one plane, without tearing or stretching. Every developable that is neither a cone nor a cylinder is generated by the tangent lines of a certain twisted curve, the edge of regression of the surface tangent planes of the developable are the osculating planes of the curve. When the surface is developed into a plane, part of the plane is covered twice and part is uncovered, the edge of regression furnishing the boundary. The edge of regression may alternatively be described as the locus of the point on each generator that is closest to the "adjacent" generator. The corresponding locus on the general ruled surface is the curve of striction of the surface.

A surface f has cos tangent lines, each the limit of the join of two adjacent points. Except in the case of a developable, such a line is also the limiting intersection of adjacent tangent planes To touch f imposes one condition on the co lines of space, and has in general ∞2 bitangents, each touching it at two distinct points, and  $\infty^2$  inflexional tangents, each meeting f in three ad-

Order, Class, Rank.—The order of an algebraic surface is the degree of its equation, t = 0, of the polynomial f. It is the order of a plane section, and is also the number of intersections, real, concident or imaginary, of f with any line. These are particular cases of more general properties of the order. Two surfaces of orders  $n_f$ ,  $n_f$  intersect in a curve of order  $m_f$ , or in an aggregate of curves of this equivalent total order, when curves of contact and common multiple curves are counted a proper number of times. Three surfaces of orders  $n_f$ ,  $n_f$ , alwae  $n_f$   $n_f$  distinct points of intersection, or the equivalent of this when points of contact and common multiple points are properly counted.

The class of f is the degree of its equation regarded as an envelope, connecting the tangental co-ordinates of any one of its tangent planes. The properties of the class are dual to those of the order, it is the class of the tangent cone drawn to f from a general point, and the number of tangent planes through a general

The rank is an intermediate numerical characteristic, the number of the tangent lines that can be drawn through a given point and in a given plane through that point; it is the class of the plane section, and the order of the tangent cone

If the polynomial f falls into rational factors  $f = f_1 f_2$ , of degrees  $n_1, n_2$  where  $n_1 + n_2 = n_1$ , then each factor by itself represents a distinct algebraic surface, and if a point lies on either, its co-ordinates satisfy the equation of f, regarded still as a single surface, f is

degenerate, breaking up into the components  $f_1, f_2$ .

Polars.—The point  $P_1$  dividing the segment  $PP_0$  in the ratio  $\lambda$ : I has four homogeneous co-ordinates of the form  $x+\lambda x_0$ . The condition that  $P_1$  lies on f is that  $\lambda$  satisfies F=0, where

$$F = \lambda n_f + \lambda n^{-1} \Delta f_0 + \dots + \frac{\lambda^r}{(n-r)^1} \Delta^{n-r} f_0 + \dots + \frac{\pi}{n \cdot 1} \Delta n_f$$

$$= \frac{\lambda^n}{n \cdot 1} \Delta_0 f_f + \dots + \frac{\lambda^r}{r \cdot 1} \Delta_0 f_f + \dots + f_r$$
and  $f_0 = f(x_0, y_0, y_0, y_0, y_0), \Delta = x \frac{\partial}{\partial x_0} + \text{etc.}$ 

The surface  $\Delta u_f^f$  for  $r=u_1$ .  $, n=u_1$  is the rth polar surface of  $P_0$  with regard to  $f_a$  the first polar passes through all the multiple points of  $f_a$ . In particular,  $\Delta e^{-rf}/\sigma$  of  $f_0$  is its polar plane, and  $\Delta f_0^f$  its polar quadric. The locus of points whose polar quadric are cones is the Hessian of  $f_a$ . Its equation of degree A(n-2) expresses that the determinant of second derived functions of f vanishes.

If two roots of F = 0 are infinite, then  $P_0$  lies on f, and P on the tangent plane at  $P_0$ ; the two conditions are  $f_0 = 0$ ,  $d f_0 = 0$ . The latter represents the tangent plane at  $P_0$ , which is the polar plane of its point of contact. If  $P_0$  is a multiple point, the tangent plane does not exist, and all the first derived functions of f vanish there.

If two roots of F=o are equal and finite, its discriminant vanishes. This equation of degree  $n(n-1)^2$  in x, y, z, w is satisfied if  $PP_0$  touches f at  $P_1$ ; in general it represents the tangent cone from  $P_1$  to f. Hence the class of f cannot exceed n(n-1). It is less than this if f has multiple curves; for the condition is satisfied if  $P_0$  is a multiple point of f, and the cone vertex  $P_0$  standing on a multiple curve separates itself from the tangent cone.

If two roots of F = 0 are 0, then  $PP_0$  touches f at P, and f = 0,  $\Delta g = 0$ . The curve of contact of the tangent cone drawn from any point  $P_0$  to f is the whole or part of the intersection of with the first polar of  $P_0$  any residual intersection consisting of the multiple curves of f. This curve of proper contact passes through all the isolated multiple points of f.

Indicatrix; Curvature.—In order to examine a surface in the neighbourhood of a particular point, we take this as origin O of rectangular cartesian coordinates, and arrange f in homogeneous functions of  $\pi$ , y, z, say,  $f = w_t + u_t + \dots + u_{t-1}$ . If consists of a single homogeneous function  $w_t$  it represents a converge, O of degree n. If f is general, the condition that O lies of the surface is  $u_t = 0$ .

on the surface is  $u_0=0$ .

If  $P(u_0, y, z)$  is a general point of space near O, at a distance small of first order, then the perpendicular distances of P from

all general planes through O, vis, vs, vs, and all general linear functions of them, are small of first order. If P lies on f, the linear function us, being equal to -(us+1+us), is small of second order,  $u_1=0$  is the equation of the tangent plane, which in the neighbourhood of O less infinitely closer to f than any other plane. Whenever we can safely neglect small quantities of second and highes order, the surface can be replaced by its tangent plane

If we neglect terms of third and higher orders only, f can be replaced by the quadre  $u_1+u_2$ , or more generally by any of the family  $g=u_1+u_2+u_3$ , where  $u_1$  is a general linear function. These are the oscilating quadress of f at O, any one of which is a second approximation to the surface. The sections of f and g by any plane through O have the same curvature at O.

Let O be an ordinary point of f, with z as tangent plane, and therefore x=y=o as normal. Then  $f=z+u_z+\cdots+u_n$ , and the simplest osculating quadric is  $q=z+v_2$ , where  $v_2$  is the result of putting z=o in  $u_0$ .

A plane z=a small constant  $\zeta$ , parallel and close to the tangent plane, cuts f approximately in the conic  $v_1=-\zeta$ , with centre on the normal, called the *indicatrix* 

If a plane through the normal meets the indicatrix in a diameter of length ar, the radius of curvature of the normal section is  $\rho$ , where  $\frac{z}{\rho} = \frac{2\zeta}{r^2}$ . An oblique plane meeting the tangent plane

in the same line, and making a finite angle  $\phi$  with the normal, cuts f in a section of radius of curvature  $\rho$  cos  $\phi$ , the projection of  $\rho$  upon the plane (Meunier's theorem) This vanishes for the tangent plane, when the section is singular.

The major and minor axes of the indicatrix lie on the *principal* normal planes, making sections of maximum and minimum radii of curvature, say  $\rho_1$ ,  $\rho_2$ . For a normal section inclined at an angle

 $\theta$  to the first principal section,  $\frac{1}{\rho} = \frac{\cos^2 \theta}{\rho_1} + \frac{\sin^2 \theta}{\rho_2}$  (Euler's theo-

According to the nature of the indicatix, O is an ellsplic, hyperbolic or parabolic point of J. If it is elliptic, all the normal curvatures are of the same sign, and the surface bends away from the tangent plane on one side only. The part near O of the section by z=f is a small real closed curve for f of one sign, and imaginary for f of the opposite sign. The section by the tangent plane z=o has no real part in the neighbourhood except O itself, which is a double point with imaginary tangents. The surface is x-madatur.

At a hyperbolic point, the surface is anticlastic. The principal curvatures are of opposite signs, and f bends away from the tangent plane on opposite sides in these directions. Two normal sections have inflexions, the curvatures vanishing, their planes pass through the inflexional tangents at 0, which are parallel to the asymptotes of the indicatirs, and touch the section of f by the tangent plane, which has two real branches through O along which f crosses the plane. All sections near O have real branches there If there is a line lying of f, it is one of the inflexional tangents at each of its points. Conjugate tangent lines are those parallel to conjugate diameters of the indicatirs.

At a parabolic point, the inflexional tangents coincide; the section by the tangent plane has a cusp. These points lie on the Hessian.

The normal at O does not in general meet the normal at an adjacent point, unless this less on a principal section, in which case the normals intersect at one of the two centres of curvature of f at O. These coincide if the indicature is a carcle; then O is an ambiguith, all normal sections have the same curvature and all adjacent normals meet the normal at O.

Quadrics—A surface of order 2 is a quadric q; in general its class and rank are each 2 also. The sumplest example is the sphere (q.w.). Every plane section is a conic Parallel sections are similar and similarly situated conics, whose centres lee on a line, a diameter of q. The diameters concur at the centre (which may lie at infinity), which bisects every tord of q through it There are three mutually perpendicular planes of symmetry, the principal cases which

meet a in its vertices

Through each point P of q there pass two generators, real or imaginary, lying wholly on q, then plane is the langent plane to q at P, cutting q in this pair of lines. The generators faill into two systems, any one generator meeting all those of the other system and none of its own A quadic is determined by any three generators of one system, and may be defined as the locus of a line meeting three fixed skew lines. There are six directions (only two real) of planes of circular section, the points of contact of the tangent planes parallel to these are the simbility.

A quadric has three local contro (two real), to each point S of which there corresponds a directur, I, such that the datance of any point of q from S is proportional to its distance from I measured parallel to one of the planes of circular section, S and I are focus and directury of the section of q by the plane SI, which is the normal plane at S to the focal conic

A focus can also be defined as a point from which the enveloping

cone is right-circular

A quadre is fixed when its three principal sections are given; it, its determined by its inthefron of principal planes and the lengths of its principal axes. It depends on men planes from the lengths of its principal axes. It depends on men planes are in the centre is finite, there are three man types of quadric, according to the types of the principal sections self-broad (three ellipses, the hyperbolals) of one sheet (one ellipse, two hyperbolas), hyperbolad of uso sheets (two hyperbolas, one section imaginary). If the centre is at infinity, one principal section is wholly at infinity, the other two are parabolas, meeting in the one finite vertex, and q is an elliptic or hyperbolae parabolaed according as these parabolas is on the same or opposite sides of the tangent plane at the vertex. If the principal axes vensith, q is a quadric cone, if also the centre is at infinity, it is a cylinder. Finally, a degenerate quadric is a part of intersecting, parallel or comedicing planes.

The hyperboloud of one sheet and hyperbolic paraboloid have real generators, and models can be constructed by threads or wires, they are everywhere anticlastic The ellipsoid, hyperboloid of two sheets and elliptic paraboloid have imaginary generators, and are everywhere synclastic. Referred to its principal axes, an ellipsoid of semi-axes a, b, c has the equiton

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = r$$
. An elliptic paraboloid referred to its vertex as

origin can have the equation 
$$\frac{x^2}{a^3} + \frac{y^2}{b^2} = \frac{zz}{c}$$
, and the other types of quadric can be represented by equally simple equations,

Cubic Surfaces.—A surface f of order 3 is of class 12, or lower if it is uniqual. It possesses 27 lines lying on it, of which each meets 10 others, arranged in 5 intersecting pairs. There are 45 the vertices. We can also select, in 36 ways, a double-six from the 27 lines, consisting of two sets of six lines, each line meeting five of the other set and none of its own. Any plane through a line I cuts f in a residual continuenting in two points, at which the plane touches f. For two positions of the plane through f, the contic touches f, at a parabolic point of f, lyting on the Hessian.

There can be as many as four double points on a cubic surface.

If these lie at the vertices of the tetrahedron of reference, the equation can take the form  $\frac{1}{x} + \frac{1}{y} + \frac{1}{z} + \frac{1}{w} = 0$ . Each of the six

is then ruled, each plane through the double line meeting it in a residual generator. Two of these pass through each point of the double line, and their plane meets f in a fixed line of the surface,

the simple directrix.

Singularities—A singular point of a locus is one at which there is no definite, single tangent plane. If the origin O is singular, and as above  $f=u_0+u_2+\dots+u_n$ , the four conditions are those involved by  $u_0=o$ ,  $u_0=o$ , . The simplest case is the conic node, an ordinary double point,  $e_0$ -presented by  $f=u_0+u_1+u_2+\dots+u_n$ ,

where  $u_t$  is a general quadratic function of  $x_t$ ,  $y_t$ ,  $x_t$  giving the proper tangent cone. Any line through O meets f in two points coinciding at O, a generator of  $u_t$  meets it in three points, and the six lines of dissest cointag given by  $u_t = u_t = 0$  meet it in four The section of f by a general plane through O has a double point with two quite distinct branches, the tangents being generators of  $u_t$ , that by a plane through a line of closest contact has an infection on one branch. The section by a plane touching the tangent cone has a cusp, the two branches merging into one cycle.

If a general line through O meets f in p points there, in the simplest case O is an ordinary s-fold point with a proper tangent cone  $u_n$  where  $f = u_n + u_{k+1} + \dots + u_n$ , this involves  $\frac{1}{2}s(s+1)(s+2)$  conditions. Any plane through O, or any surface having O as a ordinary point, meets f in a curve having an s-fold point there if O is s-fold on the second surface, the two tangent cones having no common sheet, the curve of intersection has  $s_0$  branches through O. If O is also s-fold on a third surface, the three have  $s_{s,0}$  points of intersection absorbed at O.

If the tangent cone breaks up, the simplest case is the binode, adouble point whose quadrate tangent cone consists of two biplanes, intersecting in the edge. The section by a general plane through chas a double point as for a cone node, that by a plane through the edge has a cusp, and that by one of the biplanes has a triple point. Taking the biplanes as planes of reference, we have  $v_0 = v_0$ , then the equation says that either x or y is small of second order, or else both are small of orders between x and x. A general point of f near O is close to a definite one of the two biplanes, and, in this sense, we can speak of two sheets of f, one touched by each biplane; they are not separate sheets, but become indisquishable near theedge x = y = 0. There are three lines of closest contact in each biplane, these are in general different from the edge, which meets f in three points only.

The contended and binode are ordinary singularities;  $i \, \epsilon$ , the tangent cone, proper or degenerate, has no repeated sheet. At an extraordinary singularity, the tangent cone  $u_1$ , not only breaks up, but has a repeated sheet,  $u_1$  say, so that  $u_2 = u_1^* v_2 - v_3$ . The simplest case is the  $u n o \theta_1 a$  double point with a repeated tangent plane,  $j = u_1 + u_2 + \dots + u_n$ . The surface has two connected half-sheets, the general section having a cusp. There are three lines of closest contact, the section by a plane through one of these has a tennode, that by the tangent plane has a triple point.

A general point 0 of a double curve is a binede of a special kind. The two sheets of f are quite distinct; every simple point of f near 0 belongs definitely to one sheet on the other, the points of the double curve belonging to both. There is no continuous passage at all from one sheet to the other near 0, but on the double curve there he a certain number of pinch-points, undes of a special kind (which may be absorbed in higher singularities), at which the two tangent planes coincide, and the two sheets become connected.

A tactode of the surface is a double point where the general plane section has a tacnode, which is the plane singularity equivalent to two adjacent double points. Thus O has an infinite set of double points of f adjacent to it, one m every direction in the tangent plane, which may be considered as an infinitesimal double curve adjacent to O. In a similar way, a tacnodal curve is equivalent to two adjacent ordinary double curves.

In general, a singular point, whether solated or lying on a singular curve, is characterized, first, by its multiplicity; i.e., the number of intersections of f with a general line through the point that are absorbed there; next, by the nature of the tangent cone and its sheets, and of the singularity of a general section; and currier by the nature end arrangement of the higher singularities of special sections. By a series of suitable transformations, any angular point or curve of a surface can be inalysed into an angular into an angular point or curve of a surface can be analysed into an types, and any surface can be transformed into curve and the elementary singularities, and in particular into one having no isolated singular points, but only ordinary multiple curves and such points of higher singularity as necessarily lie on them; or alternatively into a surface having only a double curve und a number of trule points which are also trulp for the double curve.

The complete theory is complicated Isolated singular points may give rise on transformation to singular curves, and a singular curve may give rise, from the transformation of its special points of higher singularity, to other singular curves, whose geniquiarity, to other singular curves, whose geniquiarity points may be of more complicated nature (though not of higher multiplicity) than the general points of the original curve

Singular inagent planes are defined dually to the above Any surface of order  $\geq 3$  must have singularities of one or other kind, or of both. A surface f of order n with no singular points of class  $f^m$  en $(p-1)^2$ : a surface of class  $f^m$  with no singular planes is of order  $n = m^*(n^*-1)^2$ . These two equations are incompatible unless  $n = m^* n = 1$ , in which case f is a quadrate

If f has no point ampularities, it has in general two series of double and stationary tangent planes, and its reciproral has a double and a cuspoial curve. The characteristic numbers of these modify the equations relating order and class, and make them compatible. If f has higher singularities, there exists a complicated set of relations between the numerical characteristics, the simpliciar are the Plucker equations for the general plane section and tangent cone.

Curves on a Surface—The interest of f depends partly on the sumpler curves lying on it. There are always its plane actions, and its curves of total intersection with other surfaces; lower curves may arise as partial intersections, components of a total intersection that breaks up through acquiring additional singulariues, the cutting surface either touching f or passing through one or more of its singularities. All curves on a plane are its total intersections with cones standing on the curves O na quadric, the conic section by a tangent plane acquires a double point at the point of contact and breaks up into a pair of generators. A cubic surface contains 27 pencils of conics, cut out by Palanes through the 27 lines, and many other systems of curves of orders 3,4, and 5, cut out by quadrics containing various sets of the lines

Other important curves on f are defined by infinitesimal properties. An asymptotic curve is one whose tangent at any point is one of the inflexonal tangents, parallel to an asymptote of the indicaturs. A curve of curvatures so one whose tangent at any point is a principal tangent, parallel to an axis of the indicaturs. Two curves of each of these kinds can be drawn through any gental point of f. A geodesic is a curve whose small arcs are each the abortest distance on the surface between their extremities. On a plane, these are lines, on a developable they are curves which become lines when the surface is fattened out. An infinite number of geodesics can be drawn through a general point of f, one starting in any direction.

Families of Surfaces—If an equation contains a parameter  $\lambda$  at represents a engly infinite family of surfaces, the most important case is the linear family or  $\rho$  sends, when the conflictants are linear functions of  $\lambda$  and the equation has the form  $f + \lambda \Phi = 0$  Just one member of the family passes through each general point of space. The total intersection of any two of the family is the same, being that of f,  $\phi$ . More generally, if f, f,  $\phi$  are any two algebraic surfaces, the equation of any other containing their total intersection can be expressed as  $\sigma f + \partial \Phi = 0$ , where  $\alpha$ ,  $\beta$  are polynomials (Noether's theorem). In the same way,  $f + \lambda \Phi + \Delta \Phi$  gives an  $\sigma^2$  linear family or  $\sigma$  of surfaces, one and only one passes through any two given points; any three surfaces of the net have the same base, or set of common points and curves,

as f,  $\phi$ ,  $\psi$ . If f is of order n, it has  $N=\frac{1}{2}(n+1)(n+2)(n+3)-1$  independent ratios of coefficients; all such surfaces form a linear family with N degrees of freedom, and one can be made to pass through N points in general position, each of which presents one independent condition to f. Thus a quadric can be drawn through nice points, and these determine it if they are general. However, seven points determine a net of quadrics, whose base consists of eight points, viz., the seven and another, associated with and determined by the seven, which offers no independent condition; but the passage of the quadric through it is a necessary consequence of its passage through the others: Thus nine points do not determine a quadric if any eight of them are an associated set of this stature.

To have a given point as a double point imposes four conditions on f, to contain a given line, n+1 conditions. The number of independent conditions presented to f by an assigned element of a my sort is the postulation of that element. The conditions for combination of elements may force f to contain other fixed elements, or to break up. If six out of nine points he on a plane, the only quadrac containing them all consists of this plane and the plane of the other three points.

Two surfaces are orthogonal if at every common point the angle between them, re, between their normals, as angh-tangle. If three surfaces are mutually orthogonal, their cuives of intersection are curves of curvature on each surface. If three linear families are such that the three surfaces through any point as a a right angles to each other, they form an orthogonal system, f can form part of such a system only if it satisfies a certain differential equation of thind order. In the same way, a cubic family, with three members through any point, can be an orthogonal system, e.g., the confocal quadros:

$$\frac{x^2}{a^2+\lambda} + \frac{y^2}{b^2+\lambda} + \frac{z^2}{a^2+\lambda} = x$$
,

where the members through a point consist of an ellipsoid, a hyperboloid of one sheet, and a hyperboloid of two sheets

Among the infinite number of surfaces having the same boundary, i.e., a given closed curve through which each is to pass, the minimal surface is that whose area is least. This is the form assumed by a soap film bounded by a wire in the form of the given contour. The same property must attach to any small portion of the surface, and leads to a differential equation of second order, the boundary conditions determining the arbitrary elements of the solution. A minimal surface is anticlastic everywhere. If it were synclastic at a point P, a plane near the tangent plane at P on one side would cut it in a small plane closed curve, approximately the elliptic indicatrix, whose area would be less than that of the cap on which P lies; and the total area could be reduced without affecting the given boundary.

Parametric Representation; Genus.—The co-ordinates of any point on f can be represented as functions of two parameters. We may consider s, y as the parameters, and g given as an implicit function of these by the equation f—o. More often it is convenient to express each co-ordinate as an explicit function of two other parameters, say  $= \phi(u, s)$ ,  $= \psi(u, s)$ ,  $= \psi(u, s)$ .

In general,  $\phi$ ,  $\psi$ ,  $\chi$  are many-valued functions, if there are ests of values of x, y, x for each set of w, and we take w, a as co-ordinates of a point of a plane, then f is represented on this plane by an (r, x) point transformation. The nature of the representation depends largely on the form of the expression for the element dx of length of a retraced on the surface, given by

$$ds^2 = dx^2 + dy^2 + dz^2 = Edu^2 + 2Fdu \ dv + Gdv^2$$
, say,

where E, F, G are certain functions of u, v. Here  $E^{\dagger}du$ ,  $G^{\dagger}dv$  are the elements of length along the curves represented by  $v = {\rm const.}, u = {\rm const.}, a$  the point whose parameters are u,v, while F depends also on the angle between these curves. If they are everywhere at right-angles, e, e, g, if they are the curves of curvature, then

Rational surfaces are those which can be represented on a plane by a (1, 1) point transformation. Then the co-ordinates of any point on fare rational functions of two parameters, the coordinates of the corresponding point of the plane. Of the different plane of the corresponding point of the plane. Of the different plane representations of f, the lowest is that for which the curves in the plane corresponding to the plane sections of f are of lowest order. Any two of these have n variable intersections, corresponding to the points of f on the common line of the two planes of section, he remaining intersections are fixed, at points of the plane fundamental for the representation. An important family of curves on f are those corresponding to the lines of the plane. Any two of these have one and only one variable intersection, the remaining at points of f fundamental for the representation. All quadrics and cubics are rational. Surfaces of higher degree are not, unless they have a sufficient number of sincular nonsta and curves.

vanish if it is rational, and may be regarded as answering to the genus of a curve The simplest is the genus as defined by Noether (Flachengeschlecht), the number of linearly independent advoint surfaces of degree n-4, passing s-1 times through every ordinary s-fold curve of f, and s-2 times through every ordinary isolated s-fold point, with other conditions at extraordinary singularities It is also the number of linearly independent double integrals of the form  $\iint F(x,y,z)dxdy$ , where F is a rational function and x,y,z are connected by f=0 If f has no singularities, its genus is  $\frac{1}{n}(n-1)(n-2)(n-3)$

SURFACE TENSION. The title under which many surface phenomena-including Capillarity-are usually considered

When the surface of water (or other liquid) in a tank is carefully examined it is found not to be perfectly level. The statement that water finds its own level is only approximate. The surface in fact becomes considerably curved near its edges where the liquid comes in contact with the wall of the tank.

If a vertical tube with a very narrow bore is placed with one end in the water, the liquid rises some distance above the level of the outer surface. The rise is greater the smaller the chameter of the bore. The rise of oil through a wick is a phenomenon of the same kind

If a small quantity of mercury is poured on a horizontal plate it forms a drop. If the quantity is only a few cubic millimetres the drop is nearly spherical-a much larger quantity spreads out into a cake-shaped mass with a nearly flat top and with rounded

A drop of oil placed on a clean water surface spreads almost instantaneously so as to form a very thin film. The thinness of the film can be judged from the colours that flash out or from the size of the area covered by even a small drop.

The phenomena of soap bubbles and the formation of froth in solutions of soap are also familiar ones. In these cases, also, thin films are formed

The propagation of ripples of very short wave-length follows a

different law from the propagation of deep sea waves. When camphor is sciaped so that the fiagments fall upon a clean surface of water, they rush about on the surface with very rapid and rapidly changing motion. A minute quantity of oil placed on the surface brings them almost instantaneously to

These and many allied phenomena, can all be studied under one heading. They arise from the existence of surfaces separating one medium from another

The special forces which come into play are thence known as Surface forces. The rise in tubes of narrow bore-which are known as capillary tubes because the bore is as "fine as a hair" is due to these forces. From the special way in which the effects arise in this case the action is called capillary action. This name, though often applied in other cases, is hardly applicable except to the case of narrow tubes, while the term surface action is applicable in all. The forces which are concerned in these phenomena are those which act between neighbouring parts of substances. These also produce the effects of cohesion.

Newton in the third edition of his Opticks refers to them in the following passage -"The parts of all homogeneal hard Bodies, which fully touch one another, stick together very strongly . . . I . . , infer from their Cohesion that their Particles attract one another by some force which in immediate Contact is exceeding strong, at small distances performs the chymical Operations above mention'd, and reaches not far from the particles with any sensible Effect. . . . There are therefore Agents in Nature able to make the Particles of Bodies stick together by very strong Attractions. And it is the Business of experimental Philosophy to find them out."

There are several numerical characteristics of a surface that also act between the particles of matter because these latter can act over very great distances (The earth is controlled in its motion round the sun by gravitation ) Cohesion acts to any measurable extent only over minute distances. Sticks of chalk for drawing are made by highly compressing finely ground chalk and other materials. If a stick is broken and the two parts are brought into their original position as nearly as possible by hand they do not stick together because the neighbouring particles are still so far apart as to exert no sensible attraction. High pressure is needed for them to begin sensibly to attract each other. Before considering in detail how these attractions arise we give a historical summary of the development of the subject.

Historical .- (The following historical summary is taken from James Clerk Maxwell's classical article in the ninth edition of this Encyclopaedia, as modified by the 3rd Lord Rayleigh in the tenth edition.) According to J. C Poggendorff (Pogg. Ann. ci p. 551), Leonardo da Vinci must be considered as the discoverer of capillary phenomena, but the first accurate observations of the capillary action of tubes and glass plates were made by Francis Hawksbee (Physico-Mechanical Experiments, London, 1709, pp. 139-169, and Phil Trans. 1711 and 1712), who ascribed the action to an attraction between the glass and the liquid He observed that the effect was the same in thick tubes as in thin, and concluded that only those particles of the glass which are very near the surface have any influence on the phenomenon Dr. James Jurin (Phil Trans, 1718, p 739, and 1719, p 1083) showed that the height at which the hequid is suspended depends on the section of the tube at the position of the meniscus, and is independent of the form of the lower part. Sir Isaac Newton devoted the 31st query in the last edition of his Opticks to molecular forces, and instanced several examples of the cohesion of liquids, such as the suspension of mercury in a barometer tube at more than double the height at which it usually stands This arises from its adhesion to the tube, and the upper part of the mercury sustains a considerable tension, or negative pressure, without the separation of its parts He considered the capillary phenomena to be of the same kind, but his explanation is not sufficiently explicit with respect to the nature and the limits of the action of the attractive force.

It is to be observed that, while these early speculators ascribe the phenomena to attraction, they do not distinctly assert that this attraction is sensible only at insensible distances, and that for all distances which we can directly measure the force is altogether insensible. The idea of such forces, however, had been distinctly formed by Newton, who gave the first example of the calculation of their effect in his theorem on the alteration of the path of a light-corpuscle when it enters or leaves a dense body.

Alexis Claude Clairault (Théorie de la figure de la terre, Paris, 1808, pp. 105, 128) appears to have been the first to show the necessity of taking account of the attraction between the parts of the fluid itself in order to explain the phenomena He did not, however, recognize the fact that the distance at which the attraction is sensible is not only small but altogether insensible. I. A. von Segner (Comment. Soc Reg Götting, i. [1751] p. 301) introduced the very important idea of the surface-tension of liquids, which he ascribed to attractive forces, the sphere of whose action is so small "ut nullo adhuc sensu percipi potuerit."

In 1756 J. G. Leidenfrost (De aquae communis nonnullis qualitatibus tractatus, Dusburg) showed that a soap-bubble tends to contract, so that if the tube with which it was blown is left open the bubble will diminish in size and will expel through the tube the air which it contains

In 1787 Gaspard Monge (Mémoires de l'Acad. des Sciences, 1787, p. 506) asserted that "by supposing the adherence of the particles of a fluid to have a sensible effect only at the surface itself and in the direction of the surface it would be easy to determine the curvature of the surfaces of fluids in the neighbourhood of the solid boundaries which contain them; that these surfaces would be linteuriae of which the tension, constant in all directions, would be everywhere equal to the adherence of two particles, and the phenomena of capillary tubes would then present nothing which could not be determined by analysis." He applied These forces must be distinguished from those of gravity which this principle of surface-tension to the explanation of the apparent attractions and repulsions between bodies floating on a liquid

In 1802 John Leslie (Phil Mag, 1802, vol xiv p 193) gave the first correct explanation of the rise of a liquid in a tube by considering the effect of the attraction of the solid on the very thin stratum of the liquid in contact with it. He did not, like the earlier speculators, suppose this attraction to act in an upward direction so as to support the fluid directly. He showed that the attraction is everywhere normal to the surface of the solid The direct effect of the attraction is to increase the pressure of the stratum of the fluid in contact with the solid,

so as to make it greater than the pressure within the fluid In 1804 Thomas Young (Essay on the "Cohesion of Fluids," Phil. Trans , 1805, p 65) founded the theory of capillary phenomena on the principle of surface tension. He also observed the constancy of the angle of contact of a liquid surface with a solid, and showed how from these two principles to deduce the phenomena of capillary action. His essay contains the solution of a great number of cases, including most of those afterwards solved by Laplace, but his methods of demonstration, though always correct, and often extremely elegant, are sometimes rendered obscure by his scrimulous avoidance of mathematical symbols. Having applied the secondary principle of surface tension to the various particular cases of capillary action. Young proceeded to deduce this surface tension from ulterior principles. He supposed the particles to act on one another with two different kinds of forces, one of which, the attractive forces of cohesion, extends to particles at a greater distance than those to which the repulsive force is confined. He further supposed that the attractive force is constant throughout the minute distance to which it extends, but that the repulsive force increases rapidly as the distance diminishes He thus showed that at a curved part of the surface, a superficial particle would be urged towards the centre of curvature of the surface, and he gave reasons for concluding that this force is proportional to the sum of the curvatures of the surface in two normal planes at right angles to each other.

The subject was next taken up by Pierre Simon Laplace (Mécanique céleste, supplement to the tenth book, pub in 1806) His results are in many respects identical with those of Young. but his methods of arriving at them are very different, being conducted entirely by mathematical calculations. For those who wish to study the molecular constitution of bodies it is necessary to study the effect of forces which are sensible only at insensible distances; and Laplace has furnished us with an example of the method of this study which has never been surpassed. He found for the pressure at a point in the interior of the fluid an expression of the form

### $b = K + \frac{1}{2}H(1/R + 1/R').$

where K is a constant pressure, probably very large, which, however, does not influence capillary phenomena, and therefore cannot be determined from observation of such phenomena; H is another constant on which all capillary phenomena depend; and R and R' are the radii of curvature of any two normal sections of the surface at right angles to each other

The next great step in the treatment of the subject was made by K. F Gauss (Principia generalia Theoriae Figurae Fluidorum in statu Aequilibrii, Göttingen, 1830, or Werke, v. 29, Göttingen, 1867). The principle which he adopted is that of virtual velocities, a principle which under his hands was gradually transforming itself into what is now known as the principle of the conservation of energy. Instead of calculating the direction and magnitude of the resultant force on each particle arising from the action of neighbouring particles, he formed a single expression which is the aggregate of all the potentials arising from the mutual action between pairs of particles. This expression has been called the force-function. With its sign reversed it is now called the potential energy of the system. It consists of three parts, the first depending on the action of gravity, the second on the mutual action between the particles of the fluid, and the third on the action between the particles of the fluid and the particles of a solidion fluid in contact with it.

we may for the sake of distinctness call the potential energy) shall be a minimum. This condition when worked out gives not only the equation of the free surface in the form already established by Laplace, but the conditions of the angle of contact of this surface, with the surface of a solid

In 1831 Siméon Denis Poisson published his Nouvelle Théorie de l'action capillaire. He maintained that there is a rapid variation of density near the surface of a liquid, and he gave very strong reasons, which have been only strengthened by subsequent dis-

coveries, for believing that this is the case

The result, however, of Poisson's investigation is practically equivalent to that already obtained by Laplace In both theories the equation of the liquid surface is the same, involving a constant H, which can be determined only by experiment The only difference is in the manner in which this quantity H depends on the law of the molecular forces and the law of density near the surface of the fluid, and as these laws are unknown to us we cannot obtain any test to discriminate between the two theories

We have now described the principal forms of the theory of capillary action during its earlier development. In more recent times the method of Gauss has been modified so as to take account of the variation of density near the surface, and its language has been translated in terms of the modern doctrine of the conservation of energy See Enrico Betti, Teoria della Capillarità: Nuovo Cimento (1867); a memoir by M Stahl, "Ueber emige Punckte in der Theorie der Capillarerschemungen." Pozz. Ann. cxxxix. p. 239 (1870); and J. D Van der Waals' Over de Continuiteit van den Gasen Vloeistoftoestand A good account of the subject from a mathematical point of view will be found in Tames Challis's "Report on the Theory of Capillary Attraction."

Brit Assn Report, iv. p 235 (1834)

J A F. Plateau (Statique expérimentale et théorique des liquides, 1873), who made elaborate study of the phenomena of surface tension, adopted the following method of getting rid of the effects of gravity. He formed a mixture of alcohol and water of the same density as olive oil, and then introduced a quantity of oil into the mixture. It assumes the form of a sphere under the action of surface tension alone. He then, by means of rings of iron-wire, discs and other contrivances, altered the form of certain parts of the surface of the oil. The fice portions of the surface then assume new forms depending on the equilibrium of surface tension. In this way he produced a great many of the forms of equilibrium of a liquid under the action of surface tension alone, and compared them with the results of mathematical investigation The debt which science owes to Plateau is not diminished by the fact that, while investigating these beautiful phenomena, he never himself saw them, having lost his sight in about 1840.

G L van der Mensbrugghe (Mém de l'Acad Rov. de Belgique. xxxvii., 1873) devised a great number of beautiful illustrations of the phenomena of surface tension, and showed their connection with the experiments of Charles Tomlinson on the figures formed

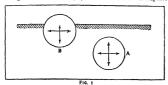

by oils dropped on the clean surface of water.

Athanase Dupré in his 5th, 6th and 7th Memoirs on the Mechanical Theory of Heat (Ann. de Chimie et de Physique, 1866-68) applied the principles of thermodynamics to capillary phenomena, and the experiments of his son Paul were exceedingly ingenious and well devised, tracing the influence of surface tension in a great number of very different circumstances, and deducing from independent methods the numerical value of the surface tension. The experimental evidence which Dupré obtained bearing on the molecular structure of liquids must be very valuable, even if our present opinions on this subject should turn out to require modification.

# GENERAL THEORY OF CAPILLARY ACTION

It is found by experiment that the forces between molecules to which cohesion is due only act preceptibly across very short distances. If we regard the forces between two particles as acting according to a law depending only upon their positions it must The condition of equilibrium is that this expression (which vary inversely as the distance according to a higher power than experiments of Quincke and others show that the extreme range through which sensible effect is produced by them is certainly much less than a thousandth of a centimetre and it is probably less than one millionth

In order to illustrate the important bearing of this limitation in range consider a molecule, A, well within a substance. A sphere

of a thousandth of a centimetre radius may be drawn round it and the molecules outside this sphere will have no sensible influence on A. Those within the sphere attract A but in the case of a homogeneous isotropic body their pulls will be uniformly distributed and the resultant force on A will be zero There will, however, be a pressure throughout the sphere due to the attraction: each spherical layer, being attracted, will compress the particles lying inside it But if we consider a particle B very near the surface-nearer in fact than the range of action-the state of things will be found to be different. There will be more particles pulling B downwards than upwards so that all such particles as B will experience a resultant-force downwards. There will also be a pressure at B but its value is less the nearer B is to the surface. There is, therefore, a thin, indefinitely bounded, layer near the surface which is in a different condition from the main body of the substances. Many of the properties will be different in this surface layer from elsewhere. For example, corresponding to the different pressure, the density will be different Since work is done in producing compression the potential energy will differ in the two regions. In the main body it can be written

$$\int \chi_0 \rho_0 dV = \chi_0 \rho_0 V_0$$

where V= volume,  $\rho$  density and  $\chi$  the potential energy per unit mass, in the film, owing to its minute thickness,  $\epsilon$ , which we divide up into still thinner layers, de, and surface S we write

Total mass = 
$$V\rho_0 - S \int_0^e (\rho_0 - \rho) de$$

while the total potential energy (in terms of  $\chi$  its value per unit mass) is

$$\int \chi \rho dV$$

$$V\chi_0\rho_0 - S \int_0^{\epsilon} (\chi_0\rho_0 - \chi \rho) d\epsilon.$$

Multiplying the total mass by  $\chi_0$  and subtracting from the last expression

$$E-M\chi_0=S\int_0^e (\chi-\chi_0)\rho de.$$

The right hand side is therefore an expression for that part of the energy which depends upon the existence of a surface S The integral which multiplies it is the constant (or rather, factor) known as the surface tension. This integral is a measure of the work done in increasing the area of the surface. It must be carefully distinguished from the corresponding increase in the total energy because heat is drawn in simultaneously if the change takes place at constant temperature. It is in strictness a measure takes place at constant temperature. It is a statemess a measure of the change in the "free-energy." (See Thermodynamics Thermodynamics and Physical Chemistry.)

By the principles of energy the potential energy (at constant

that of the inverse square which is obeyed by gravitation The temperature) tends to a minimum, in other words, any change that takes place spontaneously involves a diminution of this energy Hence, whenever the surface tension is positive there will be a tendency for the surface to decrease, and the diminution will in fact take place unless it is resisted by other forces This diminution takes place not by a contraction of the liquid but by a passage of the surface molecules into the body of the liquid. The properties of the body are not changed thereby. In this respect the phenomenon is quite different from the case of a stretched india-rubber film. In the case of the liquid the surface tension remains constant during the contraction of the surface area; in the case of the stretched india-rubber it diminishes along with the contraction

We may express it otherwise by saying that if an imaginary straight line be drawn anywhere in the surface, when equilibrium exists there must be a force acting across the line in such a direction as to prevent further contraction of area It is easy to show that this force per unit length of line is numerically the same as the surface-tension as defined above

Dupré has described an arrangement by which the surfacetension of a liquid film may be illustrated A piece of sheet metal is cut out in the form AA' (fig 2). A very fine slip of metal is laid on it in the position BB' and the whole is dipped into a solution of soap When it is taken out the rectangle AA'CC' is filled by a liquid film. This film tends to contract on itself and the loose strip of metal will, if let go, be drawn towards AA'. If S is the area of one face of the film the potential energy is  $\sigma S$ . If AA'=b and AC=a it is equal to  $\sigma ab$  Hence if F is the force

If 
$$AA'=b$$
 and  $AC=a$  it is equal to  $\sigma ab$  Hence if  $F$  is the force by which the slip is pulled towards  $AA'$ ,  $F=\frac{d}{ab}(\sigma ab)=\sigma a$ ; so that the force per unit length for one face is  $\sigma$ . Hence,  $\sigma$  is either

the force per unit length or the potential energy per unit area.

It must be added that we have only considered one of the two faces and the force due to it. There is an equal force on the strip due to the second surface so that the total force is twice as great as the value taken. But the total area is twice as great also so that the conclusion remains unchanged.

There are other ways of illustrating the existence of the tension. Form a film as before but in a fixed frame. Tie a short length of spider line or fine unspun silk so as to form a flexible ring If it is placed carefully on the film it usually takes an irregular shape. If the film inside the ring is destroyed by piercing it with a hot wire the spider line opens out into a circular form, this being the form which makes the surrounding surface least for a given length of line. Again, a small drop of mercury or a falling rain drop is practically spherical-the sphere being the form which has the smallest area for a given volume. A large drop fails to be spherical because gravitational forces are then strong enough to compete successfully with surface forces. Sometimes a difficulty is felt in connection with the assertion that the surfacetension is constant. Take a film

such as we considered and place it vertically The upward force on  $AA' = 2\sigma a$  for the two faces, the downward force at the level CC' is also 200. The remaining force on the portion of the film between these lines is its weight Hence the resultant force on the mass of the film is its weight and its acceleration should therefore be that of a freely falling

body. Yet whatever may be found true for a pure substance, it cannot be true in general that the tension is the same at all parts of a large area. In the case of a soap film some adjustment must automatically take place (either by alteration of concentration or otherwise) which makes the upper tension a little greater than the lower. It is probably the power of such an adjustment being made in the case of a soap solution which is the leading requisite permitting a durable film to be made. Otherwise the film would literally fall to pieces.

Theory of Cohesion.-The mode in which cohesion is ex-

plamed by assuming the existence of forces between elements (if e, infinitesimal volumes) of matter can be illustrated by supposing the substance of a body to be distributed continuously unstead of partitioned into molecules. Such was the mode in which Laplace, more than a century ago, legarded it, and indeed it is the assumption that has always been made until recent times regarding the distribution of the substance of a body

Let the force between two elementary volumes be supposed

proportional to the product of the volumes and inversely as the nth power of their distances apart. The force required is that across unit area drawn anywhere well miside the body arising from the volumes on each side of it. The calculation is made in successive stages.

(i) Take a lamina of thick-

ness dy The force on an elementary volume v due to a zone of radius x and width dx is  $v \cdot \frac{2\pi x dx}{a} \cdot \frac{a}{dy}$  since the tangential com-

ponents will cancel each other. Hence the whole lamina attracts the element with a force

$$2\pi va \int_{a}^{\infty} \frac{x dx}{r^{n+1}} \cdot dy = 2\pi va \int_{a}^{\infty} \frac{dr}{r^{n}} dy$$

This becomes  $\frac{2\pi va}{(n-1)a^{n-1}} dy$  or  $\frac{2\pi v}{(n-1)a^{n-2}} dy$  since we assume the

forces to vanish at infinity.

(ii.) Let v be an element in a parallel lamina of thickness da. Then the total force per unt area on such a lamina II. is obtained by putting v=da. Hence we find the force on a semi-infinite solid above lamina II due to lamina I. by integrating from o to ∞ that is

m o to 
$$\infty$$
 that is

Force on semi-solid (per unit area) =  $\frac{2\pi dy}{n-1} \int_{0}^{\infty} \frac{da}{a^{n-2}}$ 

=  $\frac{2\pi}{(n-1)(n-3)} \left| \frac{1}{a^{n-3}} \right|_{0}^{\infty}$ 

(iii.) The force (per unit area) on such a semi-infinite body due to a semi-infinite body in contact with it is obtained by integrating with respect to y from y=0 to y= $\infty$  This force is the cohesion per unit area and is given by

$$K_0 = \frac{2\pi}{(n-1)(n-3)(n-4)} \left| \frac{1}{a^{n-4}} \right|_0^{\infty}$$

The unit of force used is that between two unit volumes separated

by unit distance.

Lord Rayleigh remarks: "The pressure will therefore be infinite whatever n may be. If n-4 be negative the attraction of infinitely distant parts contributes to the result; while if n-4 be

finite whatever w may be. If n-4 be negative the attraction of infinitely distant parts contributes to the result; while if n-4 be positive the parts in immediate contiguity act with infinite power. For the transition case, discussed by W. Sutherland (Phil. Mag. xxiv. p. xxy. 3.887) of n-4, K is also infinite. The adds "It seems therefore that nothing satisfactory can be arrived at under this head."

In more recent times, however, it has been realized (particularly by the Dutch school of physicists) that to treat the body as a continuum is bound to give erroneous results. Every substance is known to be built up of molecules. If we assume the existence of attractions depending on the distance between the existence of attractions depending on the distance between the existence of attractions depending on the distance between the existence of attractions depending on the distance personal to absolute contact. The lower limit in the last integration should be the Past distance of separation between the lines of centres of familiarous layers. This will be a magnitude comparable with the indectinar diameter, say s. The value we seek then becomes  $\frac{s}{s} = \frac{s}{(n+2)(n-3)(n-4)} \frac{s}{s^{n-4}}$ 

There is now no objection on the above grounds to the power law provided that n>4

There can be no doubt that if the amount of matter compressed into unit volume (\*e, 'the density p) be increased the value of the nutrunisc pressure would be increased Moreover, a factor I (akin to the gravitation constant) is also needed if K is to be expressed in ordinary dynamical units Hence finally

$$K = \Gamma \cdot \frac{2\pi\rho^2}{(n-1)(n-3)(n-4)} \cdot \frac{1}{s^{n-4}}$$

The quantity, K, is called the Laplace pressure or intrinsic pressure. More generally we could assume that the force between elementary volumes is  $f\left(r\right)$ . The successive integrals then become

i. 
$$2\pi a \int_{a}^{\infty} f(r) dr dy = 2\pi a \phi(a) dy;$$
  
ii.  $2\pi dy \int_{y}^{\infty} a \phi(a) da = 2\pi dy \psi(y),$   
iii.  $K_{0} = 2\pi \int_{y}^{\infty} \psi(y) dy$ 

where  $\phi a$ ,  $\psi y$  are written as the values of successive integrals Finally K is obtained in ordinary units by multiplying by  $\Gamma \rho^2$  For example if  $f(r) = \epsilon^{-kr}$  where k is a constant we have

$$\psi(s) = \frac{ks + 1}{k^3} e^{-ks}$$

The difficulty in testing these formulæ arises from the occurrence of three variables (k<sub>s</sub>, k<sub>s</sub>)? The only one of these about which we know the value independently is s which for hquids must be of the same order as the molecular diameter Caution is necessary in considering forces which vary so fast with the distance as cobesive forces undoubtedly do. A small error in the assumed value for s would lead to very considerable error in k and I. The intrinsic pressure at the breaking point of a solid in tension should be the breaking stress itself. The latter as actually measured is, however, only a lower limit of K since flaws in the material and irregularities in the application of the tension will lead to fracture occurring at a value lower than the ideal stress. The effect of cohesion on the characteristic equation of a gas was allowed for by van der Wals who, following Laplace, took the intrinsic pressure as varying with the density square alone. The equation becomes

$$(p+a\rho^2)(v-b) = RT$$

where at the same time b is introduced to represent the fact that the volume of the gas cannot be reduced to ears. Here K and which for water at ordinary densities is between the value of the fact that the equation turns out to be approximationally makes caution necessary. Moseover of is found to vary nearly inversely as the absolute temperature. We are obliged to assume, therefore, either that  $\Gamma$  as a function of the temperature or, what is more lakely, that s is such a function. The last average distance of approach of the molecules must be affected by the motion of agitation amongst them and this increases as the square root of the absolute temperature.

Besides these considerations if must be pointed out that the modification worked out by the Dutch school only partly allows for the effects arising from the molecular character of matter. Knowing the forces between two molecules at a given distance apart, the actual value of the intrinsic pressure could only be correctly obtained by summing up the components (normal to the interface at which the pressure is being calculated) of all the forces between every pair of molecules each being calculated for the actual positions in which the molecules instantaneously are. It is true, that with forces that varys or fast with distance are. It is true, that with forces that varys or fast with distance individual contributions are important; the contributions of the contributions of the contributions of the contributions of the contribution of the start followed by Laplace. Something has been done in this direction (Lenard-Joses, Paraday Society, "Discussion on co-

hesion." 1927) but the fact remains that though the law of molecules. Hence force is probably greater than the inverse fifth it may vary up to the inverse seventh so far as present knowledge goes. If we take the higher of these two estimates the force between molecules which are neighbours and those that are next door to neighbours will be as 27 to 1, 18., in the ratio 128 to 1 or that between any layer and the next and next but one contiguous layer as 26 to 1, 16, in the ratio of 64 to 1 Hence all but a small percentage of the intrinsic pressure is due to the molecules in a small volume surrounding the point. This conclusion is important since it signifies that in any material (gas, liquid, solid) the intrinsic pressure will be uniform at all points except for a thin layer of usually negligible volume near its boundary.

Theory of Surface Forces .- This surface layer has theoretically no inner boundary but it may be taken, for most purposes. as being only - few molecules thick (mol. diameter is of the order of 10-8 cm) The most prominent peculiarity is that it possesses more potential energy than the rest of the body per

unit volume

Now increase of free energy at constant temperature is equal to the external work done on a system If we write dW = odA σ is called the surface tension To determine its value theoretically we estimate dW for the formation of a surface of unit area. Now if a body is split by a plane section and the two halves separated, a fresh surface is formed. The attraction per unit area between the halves at any distance x is

$$2\pi \int_{-\infty}^{\infty} \psi(y)dy = K(x)$$
 say.

The total work of separation is  $\int_{-\infty}^{\infty} K(x) dx$  and in the process a

fresh area of 2 units is formed Hence expressing the work done in ordinary units

$$2\sigma = 2\pi\Gamma\rho^2 \int_0^{\infty} K(x)dx$$

(In previous editions many theorems were given [some of which date from Laplace which depend, however, upon the lower limit being zero It is sufficient to say that these theorems are not applicable to the formulae given here)

If a power law is taken as the law of force between molecules it follows that

$$\sigma = \frac{\pi \rho^{\text{e}\Gamma}}{\left(n-1\right)\left(n-3\right)\left(n-4\right)\left(n-5\right)s^{n-4}}.$$

 $\frac{K}{\pi} = \frac{2(n-5)}{3}$ 

$$\sigma = s$$

For water at ordinary temperature, approximately

K=10,000 Atm = 10<sup>10</sup> dynes/sq.cm.  

$$\sigma = 75$$
 dynes/cm.  
 $s = 4 \times 10^{-8}$  cm.  
 $n - 5 = \frac{10^{10} \times 4 \times 10^{-8}}{2 \times 75} = \frac{8}{3}$ 

The Change

It must not be forgotten, however, that K and s are obtained by very approximate methods only.

Interfacial Tensions .- When two liquids are in contact there is in general a surface-tension at the interface which is called interfacial tension. Denoting this by o12 and the tensions of the liquids as o1 and o2 respectively, and carrying out a separation of the two liquids the value of out can be determined. In the above process the interface between 1 and 2 disappears and two fresh surfaces appear at which the tensions are  $\sigma_1$  and  $\sigma_2$ . Hence

$$\sigma_2 + \sigma_1 - \sigma_{12} = 2\pi \rho_1 \rho_2 \int_{\underline{a_1 + a_2}}^{\infty} K(x) dx$$

$$\sigma_{12} = \pi \rho_1^2 F(s_2) + \pi \rho_1^2 F(s_1) - 2 \pi \rho_1 \rho_2 F\left(\frac{s_1 + s_2}{2}\right)$$
.

Young took the functions F as being identical being all the same function of zero instead of the molecular diameters,

$$\sigma_{12} = \pi (\rho_2 - \rho_1)^2 F(0)$$

$$\sqrt{\sigma_{12}} = \text{const} \times (\rho_2 - \rho_1)$$
.

Hence for three liquids taken pair by pair

$$\sqrt{\sigma_{12}} + \sqrt{\sigma_{23}} + \sqrt{\sigma_{21}} = 0$$

These simplified relations are known not to be true On the other hand if the power law is valid and is the same law for different substances the equations given here lead to

$$\sigma_{12} = \left(\frac{\rho_{2}^{2}}{\sigma_{2}^{n-6}} + \frac{\rho_{1}^{2}}{\sigma_{1}^{n-6}} - \frac{2\rho_{1}\rho_{2}}{\left(\frac{n+n}{2}\right)^{n-6}}\right) \frac{\pi}{(n-1)(n-3)(n-4)(n-5)}$$

and the square root law should not be expected to be true excepting in special cases in which the molecular diameters of the three substances were the same.

All surface-tensions with which we have to deal are in reality interfacial tensions since a liquid is always in contact with its own vapour or the gas in which it is immersed. The effect due to the gas is known, however, to be very small

The normal pressure to be expected from the existence of a superficial tension is best obtained by considering in the first place a cylinder.

Consider an element of surface, ds x unity. The tensions acting at its extreme edges are inclined to one another and have a resultant inwards Their resultant is a normal force  $2\sigma \sin \frac{d\theta}{d\theta}$ or in the limit  $\sigma d\theta$ . But  $\frac{ds}{d\theta} = R$  (the radius of curvature), hence

the normal force is  $\sigma \frac{ds}{p}$  Since this acts over an area equal to ds, the normal pressure is  $\sigma/R$ .

If we take a body of any shape and select a square-bounded element of the surface, the tensions in the plane of the diagram

are equivalent to a normal force  $\sigma ds_1 \times \frac{ds_2}{R_1}$  and those acting on the other two edges to  $\sigma ds_2 \times \frac{ds_1}{R_1}$ . Hence per unit area

$$p = \sigma \left( \frac{1}{R_1} + \frac{1}{R_2} \right).$$

Here  $R_1$  and  $R_2$  are the radii of curvature in two planes at right angles. Owing to Gauss's theorem of integral curvature the sum of two such curvatures at a point is a constant. The above the orem is therefore true whether the two rectangular planes considered are principal planes or otherwise. In the case of a sphere

$$p = \frac{2\sigma}{R}$$

Effect of Temperature,-The variation of surface tension with temperature was not taken into account in Laplace's theory.

The forces between molecules were taken, like gravitational forces, to be independent of temperature. The rise in a capillary tube was supposed to vary merely because the density varied Experiment has shown, however, that the tension itself in all cases diminishes with rise in temperature. That it must ultimately

diminish to zero can be inferred from the fact that according to the usual conceptions as to the critical state a liquid and its vapour will at that point become identical with one another; the tension at the interface must then be zero. Eotvös introduced the conception of molecular surface tension. By means of somewhat doubtful reasoning he concluded that  $\sigma(Mv)$  (where Mvwhere the lower limit is the sum of the radii of the two kinds of is the molecular volume), plotted against temperature should give

the same kind of curve for different substances, and he found in fact that it was representable by  $K(T_0-T)$  where  $T_0$  is the critical temperature and K a constant According to Ramsay and Shelds K should be the same constant for all non-associated substances. In realty K vanes betyeen 15 and 26 and it is necessary also to change  $T_0-T$  to  $T_0-T-\delta$  where  $\delta$  is a small constant, so that the law is only a rough one According to this equation the curve would be a straight line cutting the temperature axis a few degrees below the critical point

In connection with this, it is important to remember that  $\sigma$  is only the free energy per unit area and not the total energy per unit area (n) Lord Kelvin was the first to prove that the variation of  $\sigma$  with temperature, involves that  $\sigma$  must be greater than  $\sigma$ ,  $\sigma$  in other words, when an expansion of the surface takes place heat must be added to keep the temperature constant The connection between these quantities he proved thermo-

dynamically to be 
$$u = \sigma - T \frac{d\sigma}{dT}$$
 (vide Thermodynamics applied

to chemistry). Now, at the critical point, u (which is only the extra energy due to the existence of unit surface and not the total energy of the whole body) must also vanish But if both u

and 
$$\sigma$$
 are then zero so also must  $T \frac{d\sigma}{dT}$  be zero.

Hence, if our conceptions of the critical state are correct the curve of  $\sigma$  plotted against T instead of being a straight line must become horizontal at the critical point. In 1894, van der Waals showed that a formula of the type  $\sigma = A(T_s - T)^s$  was to be expected and gave the average value of  $n = 1 \cdot 2 \tau$  as deducible from the experimental values. In 1916 A Ferguson (Phil. Mag, Jan. 1916), examining the data for 14 different organic substance showed that the best values of n ranged from 1:137 to 1  $\tau_2 4 s$ . The advantageous character of this power countion is that it

makes 
$$\sigma$$
,  $u$ , and  $\frac{d\sigma}{dT}$  all equal to zero at the critical point and it

thus satisfies all that is required of it theoretically. Liquids, however, which are believed to be associated do not follow the above simple law

The surface energy, u, also falls to zero at the critical point, but according to a different law For taking the equation

$$u = \sigma - T \frac{d\sigma}{dT}$$

it follows that  $u=A(T_c-T)^{\alpha-1}(T_c+[n-x]T)$ . The curves for  $\sigma$  and u are shown in fig. 5 for the case of benzene The curves show he nearly a straight line law satisfies the values of  $\sigma$  until the critical point is closely approached. An interesting relation has been given by Prof. E. T. Whittaker between u and the latent heat (internal) of esoporation. The internal latent heat  $(L_i)$  botalised by subtracting the external work done from the ordinary obtained by subtracting the external work done from the ordinary

latent heat. The relation in question is that 
$$\frac{T_a}{T} \cdot \frac{u}{I_a}$$
 is nearly a

constant, and that (in C.G.S. units) this constant is about unity for ethyl oxide, methyl formate, benzene and chlorobenzene and about 2 for carbon tetrachloride. The degree of constancy is indicated in the following table for benzene (Crit temp. = 561 56)

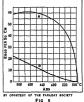

T°A.	$\frac{T_{e}u}{TL_{\bullet}}$	T°A.	$\frac{T_{e^{\mathcal{U}}}}{TL_{i}}$
353	1·106	493	1.089
403	1·100	503	1.106
453	1·067	513	1.129

The relation is important since it indicates the close connection there is between the surface energy and the volume energy of the substances.

General Properties of Surface Tension.—The notion of surface tension, though it is only a derived one, enables us to deal with all the phenomena which were enumerated at the head of this article without making explicit reference to the more fundamental notion of molecular attractions, upon which they in

reality depend. It is appropriate to summarize here the leading characteristics of this property

The tension of a liquid across any straight line drawn on the surface is normal to that line and is the same for all directions of the line and is measured by the force across an element of the line divided by the length of

that element

For any given homogeneous liquid surface, as the surface which separates water from air or oil from water, the surface tension is the same at every point of the surface and in every direction. In the case of mixtures, however, when circumstances demand it (e.g., when the surface is inclined and the flects of a given in the surface is the surface in surface in such a way as to produce a corresponding as to produce a corresponding

variation in the value of the surface tension sufficient to satisfy the conditions of equilibrium. This effect is very minute and in nearly every problem may be ignored.

When the surface is curved the effect of the surface tension is to make the pressure on the concave side greater than that on the convex side by the amount  $\sigma(C_1+C_2)$  where  $C_1$  and  $C_2$  are the curvatures in mutually perpendicular normal planes

The tension of the surface separating two liquids cannot be deduced by any reliable method from the tensions of the liquids when separately in contact with air. The experiments of C. G. M. Marangon, van der Mensbrugghe, and Quincke have led to results which show that the common surface between two liquids has a tension always less than the difference of the tensions of the separate liquids. This is usually referred to as Marangoni's rule.

If three liquids meet along a line the interfaces at the common edge must be parallel to the sides of a triangle proportional to the three tensions  $\sigma_{13}, \sigma_{23}, \sigma_{34}$  otherwise equilibrium cannot obtain (Neumania's rule) This triangle cannot exist unless two of the interfacial tensions are greater than the third. Marangoni's experimental rule ahows that the triangle is always imaguary, thence three pure fluids (of which one may be a gas) accordingly

greasy film.

When a solid body is in contact with two fluids the surface of the solid cannot alter its form but the angle at which the surface of contact of the two fluids meets the surface of the solid must depend on the values of the three surface tensons. For equilibrium

# $\sigma_{31} - \sigma_{32} = \sigma_{21} \cos \alpha$ .

The angle α is known as the angle of contact.

For pure substances the angle is definite It varies from zero (or very nearly so) for

liquids that "well" the solid to 150° or 140° for mercury on glass. In regard to the experimental behaviour of water on mercury the wealth of papers is equalled by the remarkable lack of unformity in the results obtained even when elaborate precautions are taken. A drop of water which fails to spread when placed on a mercury surface is often caused to spread by the action of pouring the mercury out of the dish—thus involving the creation of a new surface! Water shows a positive tendency to spread in vacuo on a drop formed in vacuo! (Burdon, Faraday Society, May, 1927).

Form of a Capillary Surface.—The form of the surface of a liquid acted on by gravity is easily determined if we assume that near the part considered the line of contact of the surface of the liquid with that of the solid bounding it is straight and horizontal.

This will be the case, for example, near a flat plate dipped into the liquid Let A2P2 be the vertical plate supposed to be so wide that the edge effects do not count. We will consider the forces per unit depth (perpendicular to the paper) and will consider  $A_1A_2$  as the standard level of the liquid far from the plate. The curvature of the surface at the point x, v, is

$$\frac{d\theta}{ds} = \sin\theta \frac{d\theta}{dy} = -\frac{d(\cos\theta)}{dy}$$

 $\frac{d\theta}{ds} = \sin\theta \frac{d\theta}{dy} = -\frac{d(\cos\theta)}{dy}$  and consequently the pressure in the liquid at that point is less than the pressure outside it by  $-\sigma \frac{d(\cos \theta)}{d\theta}$ . But the pressure is

less than that at a distant point where the surface is flat by goy

or  $g(p - p_0)y$  if allowance is made for the surrounding gas Hence the differential equation for the surface is

$$-\frac{d\left(\cos\theta\right)}{dy} = \frac{g\left(\rho - \rho_0\right)}{\sigma}y$$

the integral of which is  $1 - \cos \theta = 2 \sin^2 \frac{\theta}{2} = \frac{g(\rho - \rho_0)}{\sigma}$ .

The shape of the surface is therefore the elastica, ie, the form taken by a uniform spring when equal and opposite forces are apphed at its ends (see Thomson and Tait, Natural Philosophy, vol i. p. 455). The equation might have been found by considering the elementary volume of a strip of liquid, dx, sustained above the normal level of the liquid by the surface forces at its outer and inner edges The difference of the vertical component of

these is  $\sigma d(\sin\theta)$  and the weight of the strip is  $g\rho ydx$  but since  $\frac{d(\sin \theta)}{d(\sin \theta)} = -\frac{d(\cos \theta)}{d(\cos \theta)}$  the same result is obtained.

If the angle of contact is  $\alpha$  the value of  $\theta$  at the plate is  $\frac{\pi}{2} - \alpha$ ;

1/2

$$1-\sin\alpha = \frac{g(\rho-\rho_0)}{g} \cdot \frac{Y^2}{2}$$

which gives the greatest height through which the liquid is raised. A thin sheet of glass suspended from the arm of a balance

and just dipping into a liquid provides a simple way of determining the surface tension The increase in the apparent weight of the sheet when the liquid has been raised by capillarity is  $\sigma$ multiplied by twice the horizontal length of the sheet. A sensitive form of this apparatus is known as Worthington's multiplier in which the strip is rolled into a vertical cylindrical spiral.

BY COURTERY OF THE PARADAY SOCIETY

Ascent up a Capillary Tube .-- A capillary tube dipped in a liquid provides a simple method of determining surface tension To connect the surface

tension with the rise (or descent) of the liquid in the tube measured from the level part of the outside surface we equate the effective weight of the liquid raised to the total force due to the tension. The effective weight (with the symbols shown on diagram) is

$$g(\rho-\rho_0)\int_0^{\pi} 2\pi x(h+y)dx$$

for an inner cylinder of radius x where  $\rho$  is the density of the liquid and  $\rho_0$  that of the surrounding gas or vapour. The vertical component of the surface force acting all round the edge of the liquid surface of this cylinder is  $2\pi i \sigma \sin \theta$  or  $2\pi x \sigma \cos \alpha$  where  $\theta$ is the angle between the surface and the horizontal and  $\alpha$  is the 'contact-angle" which is measured with respect to the solid surface (in this case the vertical). These two expressions are to be equated to one another.

If we can neglect y altogether compared with h and integrate between the limits o and r we obtain  $2\pi r \sigma \sin \theta = g(\rho - \rho_0) \pi r^2 h$ whence  $\sigma \sin \theta = \frac{1}{2}g(\rho - \rho_0)rh$ . To seek for a better approximation we first differentiate the two sides of the equation whence

$$\frac{d\left( 1\sin\theta\right) }{dv}=\frac{g\left( \rho-\rho_{0}\right) }{\sigma}\left( h+y\right) =\frac{x\left( h+y\right) }{\beta^{2}}\,.$$

We may consider this as the standard exact equation. The left side is

$$\frac{r d \sin \theta}{d v} + \sin \theta \quad \text{or} \quad v \left( \frac{\cos \theta d \theta}{d x} + \frac{\sin \theta}{x} \right).$$

But  $\cos\theta \frac{d\theta}{dx} = \frac{d\theta}{ds}$  (where ds is an element of the curve AC) and is : the curvature in the plane of the diagram at B; and

 $\frac{\sin \theta}{\sin \theta}$  is the curvature of the surface at B in a plane at right angles to the diagram. Hence, calling these curvatures  $\frac{1}{R_1}$  and  $\frac{1}{R_2}$  we have  $\sigma\left(\frac{1}{R_1} + \frac{1}{R_2}\right) = g(\rho - \rho_0)(h+y);$ 

both of the terms here are expressions for the difference of pressure between the two sides of the surface at the point B

Narrow Tubes .- The equation shows that the sum of these curvatures increases with the height; but when h is big and y small, as it is for a very narrow tube, the sum is nearly constant. Going back to the differential form of the equation and taking the case where the liquid wets the tube, we may consider the curve as practically circular, of radius r: the corresponding value of  $y=r-\sqrt{r^2-x^2}$  and

 $\frac{d(r \sin \theta)}{dv} = \frac{1}{\beta^2} (h+y)v = \frac{v}{\beta^2} (h+r - \sqrt{r^2 - v^2}) \text{ nearly whence, by}$ integration

$$x \sin \theta = \frac{1}{\beta^2} \left[ \frac{h v^2}{2} + \frac{r x^2}{2} + \frac{1}{3} \left\{ (r^2 - x^2)^{\frac{3}{2}} - r^3 \right\} \right].$$

or since  $\sin \theta = 1$  when s

$$1 = \frac{r}{2\beta^2} \left( h + \frac{r}{3} \right).$$

By putting the radius of the circle as  $R = \frac{\tau}{\cos \alpha}$  when the angle of contact is a instead of zero this becomes

$$\cos \alpha = \frac{r}{2\beta^2} \left[ h + \frac{r}{3\cos^2 \alpha} \left\{ 1 - 3\sin^2 \alpha - 2\sin^3 \alpha \right\} \right].$$

By calculating  $tan\theta$  from  $sin\theta$  and bearing in mind that  $\tan \theta = dy/dx$ 

we can by subsequent integration obtain a closer value of vin terms of x which can, in turn, be introduced into the differential equation and so on. By such successive approximations Lord Rayleigh has obtained the equation for the case  $\alpha = 0$  in the form

$$\sigma = \frac{1}{3}g(\rho - \rho_0) hr \left[ 1 + \frac{1}{3} \frac{r}{h} - 0.1288 \frac{r^2}{h^2} + 0.1312 \frac{r^3}{h^3} \right]$$

in which the coefficients are claimed to be correct to the approximation given. The equation can only be used in the case when r is small compared with h. It may be mentioned that a very near approach to the equation can be obtained by considering the surface as ellipsoidal with its minor axis vertical. This was first shown by Hagen and Desains. Various methods are employed for determining surface tension experimentally .

(a) From the rise in a capillary tube making use of the above equation.

(b) Sentis's Method .- A capillary tube is partly immersed in the liquid. It is then withdrawn vertically and a drop remains clinging to the lower end, the position A of the vertex of the drop is noticed The liquid in the vessel is then raised until it touches the vertex (when the column falls) and then raised further till the upper surface is at the same level C as at first The liquid in the vessel is then at the level B The vertical distance AB corresponds to h in the ordinary method but in the correcting terms h must be put negative. The width of the drop is in this case to be small compared with h

(c) Jaeger's Method -In this method an orifice (a "tip") is placed just under the surface of the liquid and the pressure of gas is increased until bubbles form The maximum pressure of the gas (which is fairly sharply marked) is observed The deduction of the applicable equation is a somewhat delicate matter because the problem is really a kinetic, not a static, one The formula em-

FIG 9

$$\sigma = \frac{p_{\max} r}{2} \left[ 1 - \frac{2}{3} \frac{r}{h} \right]$$

where  $p_{max}$  is the maximum dif-

ference of pressure between the

level of the end of tube inside and outside, and r is the internal radius of the tube. The bubble is assumed to form within the internal circumference. In practice, however, it sometimes forms on the outside circumference. To obviate the uncertainty it is recommended to make the two circumferences as nearly equal as possible, but this is an experimental matter of great difficulty. The final accuracy depends chiefly on the measurement of the radius r. The subject of the formation of bubbles and drops requires much more study than it has received.

(d) Drop Weight Method,-This method is connected with the preceding one because the drops considered are those issuing from a narrow tube. It was employed by Tate (1864) who gave as the result of his observations .- Other things being the same, the weight of a drop of liquid is proportional to the diameter of the tube in which it is formed Later, Quincke used it and gave the value 2 mr o as the weight of the suspended drop just before falling provided that the inflow of liquid is sufficiently slow. A portion of the drop is always left behind when the main part falls; but he considered that it might be neglected in the case of very small drops.

Rayleigh has discussed the question from the "dimensional" point of view. (See DIMENSIONAL ANALYSIS ) Assume that the mass M of the drop depends only upon the surface tension, o, the value of acceleration due to gravity, g, the density of the liquid, p, and the inside radius, a, of the tube. Rayleigh shows that  $\sigma a/g$  has the same dimensions as a mass and that  $\sigma/g \rho a^2$  is a pure number. Since quantities that can be equated together must be quantities of the same kind, it follows that  $M \infty (\sigma a/g) F(\sigma/g\rho a^2)$ where there is no restriction, imposed by this method of inquiry, upon the function F of the quantity in the second pair of brackets. Rayleigh finds by experiment that gm/oa is fairly constant for wide ranges in the diameter of the tube For thin-walled tubes in the case of water the following values were obtained:

gpa <sup>5</sup>	<u>gΜ</u>	σ	gM
	σα	1 gρα <sup>2</sup>	σa
2.58 1.16 1.768 fi	4413 3.97 3.80 4.1373	·277 ·220 ·16g	3·78 3:90 4·06

The mean value of the constant is thus about 3.8 instead of 27 which the imperfect theory gave. Further experiments by Harkins and Brown show that the constant approaches Quincke's value as the diameter becomes very small " to all daulst in.

As a means for measuring surface tension this method is obviously not satisfactory, but for rough comparative values for liquids of like kind it is a very quick and easy method.

Wide Tubes -When a is not small the approximations made above for narrow tubes are not suitable

The question has been fully discussed by the late Lord Rayleigh to whose papers reference should be made (v Rayleigh, Proc Roy Soc A, 92, 184, 1915)

Bubbles and Drops .- These can be dealt with by similar methods Air bubbles in a liquid can be formed of any size, from minute ones which are nearly spherical to large ones shaped like a flat cake. The excess pressure  $p-p_0$ , which is easily found by experiment, determines the total curvature at the lowest point N;

being equal to  $\frac{2}{R}$ . If y is reckoned upwards as before, then

$$\frac{d(x\sin\theta)}{dx} = \left(\frac{z}{R} + \frac{y}{\beta^2}\right)x.$$

thus  $\frac{2}{p}$  replaces  $h/\beta^2$  in the previous problems. For very large bubbles, as for wide tubes, a good approximation can be obtained

by neglecting the second curvature and also  $\frac{2}{n}$ , so that

$$(\mathbf{1} - \cos \theta) = \frac{y^2}{2\beta^2} = 2\sin^2 \frac{\theta}{2}.$$

If H is the value of y for which the tangent to the curve becomes vertical we have  $H = \sqrt{2 \cdot \beta}$ . This method has been used by Quincke and others but not always with bubbles large enough to justify the approximation that is made. The bubble is conveniently formed under a slightly concave surface so as to prevent it from escaping. Drops of mercury are easily formed above a concave surface. If y is measured downwards from the summit the same formulae hold as for bubbles

Great attention has been paid to these methods owing to their use in determining surface-tension The most thorough treatment from the practical point of view is given by Bashforth and Adams (Capillary Action, 1883). By means of infinite series calculated for each of the variables each term in the differential equation can be calculated to very high accuracy and tables are drawn up enabling the form to be determined for given weights of material and given surface tensions.

Thin Films.-In this section we consider than films. The first group of cases consists of those in which the substance forms a thin sheet with gas on both sides, as for example, a soap bubble. Here we have always two surfaces to consider. When the thickness is considerably greater than the value of the range, e of molecular forces the two surfaces are independent of one another; the surface-tension must then have the usual value for each For very thin films this will not be so. If the thickness is less

than the range,  $\epsilon$ , the tension for each surface will be certainly less than the normal value, When the variation of density at different levels in the film is taken into account it is clear that the reduction in the surface-tension must begin when the thickness is twice €.

A soap film is simply a small

quantity of soapsuds spread out so as to present a large surface to the air. The soap solution may with great advantage be specially prepared The addition of glycerine and resin enables more permanent films to be prepared. Bubbles may easily be blown 20 in. in diameter in the open air using a clay pipe or a small glass funnel. (The method needs no precise description.) Sir James Dewar has obtained bubbles that last almost indefinitely if evaporation be prevented by blowing them in a confined space saturated with water vapour.

The pressure inside a bubble is greater than that outside by

$$_{2\sigma}\left(\frac{\mathrm{I}}{R}+\frac{\mathrm{I}}{R}\right)$$
, i.e , by  $_{4\sigma}/R$  where  $R$  is the radius of curvature.

The factor z arises because both surfaces give rise to normal components of forces. This result is easily obtained by considering the equilibrium of each half of the bubble. The force at the cut edge is  $2\sigma \cdot \pi R$  and this is balanced by the excess pressure acting over the plane area  $R^{2R}$ . Hence the excess pressure is

$$\frac{2\sigma \cdot 2\pi R}{\pi R^2} = \frac{4\sigma}{R}.$$

If the end of the pipe or funnel is opened the bubble will contract because of the escape of high pressure art from inside As it contracts the pressure rather paradoxically increases. It may be added that (neglecting gravity) the bubble is spherical beauth this shape makes the surface area (and therefore the potential energy) least for a given volume.

If bubbles are blown on the expanded ends of two funnels (the stem of the property of the fingers) they can be made to coalesce by carefully bringing them into contact (A slightly electrified rol brought not too near will assist the coalescence) On drawing the funnels slowly apart a cyfindrical bubble is obtained. The excess pressure is now 20/R where R is the radius of the opening of the funnel Further separation causes the cyfinder to contract in the middle, one of the two curvatures is now negative; the surface is an anticlastic one With further excession of leight the surface becomes unstable and the film collapses. It has been shown by Clerk Maxwell that a cylindrical film becomes unstable

when its length is greater than its circumference.

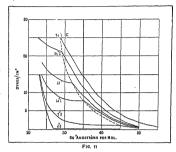

Films on Liquids .-- In the second group of cases a liquid or solid is on one side and a gas on the other. To this group belong all cases of the spreading of oil or other substance on water or other liquid or solid. This old familiar subject has recently acquired very great importance in its bearing upon molecular structures. The first to experiment in detail on such films was F. H R Ludtge (Pogg. Ann cxxxix, p 620), who showed how a film of high surface tension is replaced by one of lower surface tension Akin to these are experiments made on the erratic movements that are observed when fragments of camphor are sprinkled on a clean water surface. A trace of grease such as may be communicated to the surface by dipping a finger in the water may be sufficient practically to stop this motion The thickness of oil which is required may be spoken of as the "camphor-point." The first to determine it was (the ard) Lord Rayleigh who in 1800 (Roy, Soc. Proc.) showed that the thickness of the film of olive oil, calculated as if continuous (i.e., non-molecular) which corresponds to the camphor-point is about 2×10-8 mm.; ie., it is only a moderate multiple of the supposed diameter of a gaseous molecule and perhaps scarcely exceeds at all the diameter to be attributed to a molecule of oil; and he ultimately realized that this phenomenon was therefore entirely outside the scope of a theory of surface action such as Laplace's in which matter is regarded as continuous and that an explanation required a direct consideration of molecules.

In 1891 Miss Pockels (Nature, XIII., 437 [1891]) showed by means of a novable slider on water (the surface tenson being measured by means of the attraction on a small disc) that the contaminating material on the surface could be squeezed up and concluded from her experiments that the water-surface can exist in two sharply-contrasted conditions; the normal condition, in which the displacement of the partition makes no impression on (the value of) the tension, and the anomalous condition in which every increase or decrease (of the surface) alters the tension.

The question was taken up again by Lord Rayleigh in 1899 (Phil. Mag. XVIVII. 369) with apparatus designed on the lines of that of Miss Pockels (but employing a different way of measuring the surface tenson) and he concluded that the first drop in tension corresponded to a complete layer one molecule thick and that the diameter of a molecule of oil is about >0XIVIS min.

Later investigations have been made by I. Langmuir (in America: J. Amer. Chem. Soc., 2015 to 1918) and N. K. Adam (in England) and their coworkers. By measuring the surface area

that can be completely covered by a weighed quantity of material Langmur determined both the cross-sectional area and the length of a molecule and proved that the length for organic molecules like those of palmitic, stearnc, cerotic acids, etc, was nearly five times the breadth, while in cetyl palmitate it is nearly ten times. Adam has developed the technique and has very much evended the theoretical interpretation (Rey Soc.

Proc. A. 1921 to present time). Both Langmur and he measured the amount of "oil" and measured directly the force required to compress the surface to any given area by means of a floating barrier. The actual force measured is the length of the barrier multiplied into the difference of the surface tension on the two sides of it. On the outside the surface is that of pure water—on the inside that of water on which a thin film has been formed. It is found that when the molecules in the film are so sparse as to be widely separated from one another the force due to the film is an expansive one.

This cannot be explained on Laplace's theory: it is necessary to modify it by allowing for the effects of thermal motion; the film in such a case is analogous to a two-dimensional gas. If the barrier is now moved so as gradually to compress the film various changes take place successively which are depicted in fig. 11 for the case of a film of myristic acid on weak HCI (N/100). The unit of area adopted is a square each side of which is an Angstrom unit (i.e, 10-10 metre), and the area specified is that occupied by one molecule of the acid. The ordinates of the curves are the difference of the tensions on the two sides of the barrier, The curves are isothermals extending from 2.5° to 34 4° C. They exhibit some of the characteristics of the p, v, curves for a condensible substance. At high temperatures the curves appear to be approximately rectangular hyperbolas. For small values of the area they approach the form for liquids. At intermediate stages, however, there is no constant pressure isothermal as in the analogous case of the vapour pressure of a liquid below the critical point (the form is more nearly that for the vapour pressure of a mixture of two liquids; this fact may indicate that the underlying water takes a part in the changes that occur).

It is not to be expected that there should be complete correspondence between the two classes of phenomena. There is, however, sufficient indication that the effects of thermal motions in the films cannot be neglected. The analogy with liquids and gases can be further illustrated by plotting  $\mathcal{F}A$  against  $\mathcal{F}_i$ , where  $\mathcal{F}$  is the force applied per unit length; the resemblance to an Amagat diagram for a find is very striking, (Schofield and Rideal, Roy. Soc. Proc. A. 10.9, p. 67; 110, p. 170). It is clear from the diagram that a film of myristic acid can be squeezed up until a molecule occupies less than <math>24  $A^2$  At the opposite and where the behaviour approaches that of a gas it is to be expected

that the equation would take the form RA=RT where the value of R (allowing for only two degrees of freedom) should be 1372 per molecule, at room temperature therefore FA should be about 400. This has been experimentally verified as a limiting value for very low surface pressures. With the long-chain fatty calde, seters and intriles it is approached within 2%, the pressure being below 0.1 dyne per centimetre. With the dibasic ester CAHOCO (CAH), COO CAH is the shee neverified within 10%

The unterpretation of the experimental results is still in a somewhat fluent state and it is clear that we must not press any simple gas analogy too far. A thin film upon a body of different material cannot be treated as in a similar state to the molecules in the body of a gas. Forces must exist between the film and the liquid beneath. This may account for the fact that at any rate some films do not spread indefinitely as a gas expands into a vacuum Further, the most compressed state can only give an upper limit to the lesst cross sectional area of the molecule. The molecules are resting on the rapidly moving molecules beneath them and must share to some extent in their agitation. Sail it must be mature of films and on the demensions of molecules. Where corroboration is possible, measurements made by means of X-rays are in good accord with hose obtained by this method.

SURFBIRD, a stoutly built, sandpiperlike bird (Aphriza wrgata), dark gray and white in colour and about ten inches long. Its relationships have been disputed but it seems to be a member of the snipe-sandpiper family (Scolopacidae), closest to the turnstones.

Its summer home is in the mountains of south central Alaska, where its nest, placed on rocky ground above timber line, was first discovered in 1926. In winter it lives along the Pacific coast of the Americas, from British Columbia to the Straits of Magellan. It feeds along the water line, preferring rocky or stormy shores where its favourite food, barnacles and mussels, is exposed at low tide. It is a rather quite, inactive species, found in small flocks in winter, and is one of the lesser-known shore birds.

SURGE, in general terms, is a sudden increase to an excessive or abnormal value and a fall from such a value subsequently. In meteorology, "surge" is the name applied to those long-period progressive changes of barometric pressure which occur simultaneously at many locations over a wide region and which are superimposed on short-period pressure fluctuations of a diurnal nature or variations caused by travelling atmospheric disturbances of a local character. A pressure rise or fall of two millibars in 24 hours that occurs simultaneously within an area of 3,000,000 sq mi. corresponds to the order of magnitude of the phenomenon. Such pressure surges are commonly noted in regions close to the large semipermanent pressure centres of the earth such as the highpressure area of the southern North Atlantic ocean. "Surge" is also a meteorological term often applied to a sudden increase in velocity of the large atmospheric wind streams, especially in the tropics. Such a wind surge occurs simultaneously over a large area and frequently spreads from place to place so that its progress can be followed on weather maps. In the trade-wind belts, meteorologists frequently refer to this event as the "surge of the trades" and, in the regions of the mousoon currents, as the "burst" or "surge of the monsoon" At a given location, an increase of wind speed from about 10 m p h to 35 m p h or more at all levels from the ground up to approximately 15,000 ft can be expected in connection with a well-marked surge of the trades. (D C McD)

SURGERY. Surgery is that division of medicine in which the knowledge and skill of the physician are predominantly associated with manual operations (In Great Britan, the term is also used for a physician's office or treatment room). This distinction has obtained in some degree from the earliest times, in part because of skill on the part of the surgeon in the treatment of fractures, dislocations and wounds, in the perfection and use of ointiments, purges and enems and in the befeetion and use of ointiments, purges and enems and in the befeetion and use the treatment of the property of the more sophisticated there developed in the middle ages the bather-aurgeon (France), the wound-surgeon (Germany) and the surgeon-apothecary (Great Britain).

By the 18th century, with increasing knowledge of anatomy, operative surgery such as amputations of the extremities, excision of tumours on the surface of the body and removal of stones from the urinary bladder led to increased respect for surgery. In the early 19th century surgeons were tentatively exploring the further possibilities based on increasing knowledge of anatomy and physiology. However, the pain of operative procedures limited expansion of the field until the introduction of anaesthesia in 1846. The number of operations thereafter increased markedly but only to accentuate the frequency and severity of 'surgical infections.' Concomitant with the development by Louis Pasteur of an understanding of the relationship of bacteria to infectious diseases, Joseph Lister Introduced in 1869 his antiseptic method for the modern surgery.

The control of pain and infection remained basic requirements for surgery, although great development was made, particularly after 1930. Anaesthesiology passed from the simple administration of ether or chloroform, or even a gas, to the choice from a dozen agents for general anaesthesia and as many more for local while several drugs came to be used as accessory agents. Use of these agents is closely associated with the immediate care of the patient in preparation for the operation, general supportive major access used using it, and recovery from the general effects of it. As a result of the knowledge and skills required, ansesthesology bear recognized as a specialty for which the physician undertakes medical trainine and receives specific recognition.

The prevention and control of infection is a primary responsibility of the surgeon in every operation as well as in those diseases which are caused or accompanied by infection. In the first instance the making of an operative wound necessarily breaches the barrier of the skin, which normally protects the person from bacteria. Some of these may be harmless; others are relatively so except where the tissues traversed are damaged sufficiently to encourage their growth; and still others once present in the wound have the ability to multiply in and about it or even spread away from it, thus causing a dangerous infection. Unfortunately, the last, while not so commonly present, may be so anywhere and at any time, and then give rise to serious and even fatal infection.

The "antisepsis" of Lister, which involved the use of chemical agents for the killing of bacteria, lowered very materially the incidence of infection, so much so that it became possible to perform operations in such regions of the body as the joints, bones, soft structures and the abdominal cavity with a high degree of safety. With the simpler methods of "asepsis"-that is to say, the use of heat for sterilization where possible and the prevention of contamination of the wound directly in the course of the operationthe serious infections became relatively rare. Latterly, a more rigorous routine in the operating room, combined with a realization that damage to the tissues of the wound by rough manipulation or introduction of gross amounts of nonviable material set up a situation favourable for infection, led to a further lowering of the incidence of serious infection to the order of 1% or less. An added factor of safety was gained by the introduction of the sulfonamides, drugs which interfere with the growth of bacteria although they do not directly kill flow, and of other substances derived from certain of the lower orders of fung, which are very effective in a similar fashion. These agents continuousle that treatment of infections and made operations represent the in the presence of infection or unavoidable contamination by bacteria. In many instances their use in established infection obviated the necessity of operative procedures. It became unusual for a patient to die from an infection unless the infection had got completely out of hand before consultation with a physician or

The control of infection is of particular importance as regards injuries incurred in war and scarcely less so in civilian life. In World War II and the Korean war, of those wounded in combat and surviving to come under surgical care promptly, relatively few died. This was a marked improvement over the experience of previous wars and was due in considerable degree to the control of infection.

"Shock."—In obtaining these results, a better understanding of what was formerly called "surprised abode" played a major role. "Shocke" is usually characterised by what has formerly called "surprised by major processing a rapid, thready pulse which can be easily our research as the same a rapid, thready pulse which can be easily our pressure. The condition is most striking when occurring suddenly or unexpectedly and is by no means confined to surprised patients. Where the heart is primarily not at fault, as is the case in most instances of "shock" resulting from injury, the failure is essentially that of an inadequate return of blood to the heart so that, no matter how vigorously it beats, its output is Insufficient to maintain circulation throughout the body. This perpiperal circulations is dependent not only upon the output of the heart but also upon the total capacity of the vessels and the volume of the blood within them.

In most instances of "shock" encountered by the surgeon the cause is a decrease of blood volume. The simplest cause and also the commonest in war is loss of whole blood from one or more vessels either in large amounts abruptly or in smaller amounts over a longer period This may be external and obvious or internal into tissues and cavities and therefore not easily ascertained. If the loss is severe and the state of "shock" profound or continued, the decreased interchange of the gases, salts and proteins carried by the blood causes profound change in the functions of the tissues and organs, and if the damage becomes severe and irreversible leads to death. It is obvious that the treatment is prompt control of the bleeding and an equally prompt restoration of the normal blood volume This can be done most effectively by the introduction of whole blood obtained from a blood bank. If blood cannot be obtained, plasma or artificial substitutes for it may serve temporarily. Or if none of these is available, a physiological salt solution can be administered by mouth and intravenously.

The same situation may obtain in the course of an operation. Previously and traditionally the surgeon operated with great speed in an effort to avoid "shock," on the supposition that it was caused by pain. Even after the introduction of annesthesia, it was still fell necessary to operate rapidly, by reason of the presumed toxic effects of the agents used. This was accompanded in most instances by the loss of large amounts of blood. Later it was recognized that annesthesia, given by a competent annesthesia, better of the control of the hypothetical effect of pain was set it is practically always due to the loss of blood externally or into the tissues which have been roughly handled. If it does occur, prompt restoration of the blood volume with whole blood outley tretives the situation.

There are, however, instances of "shock" in which, although there is no gross break in the vessels, the plasma leaks through their walls into the tissues or body cavities rangidy and in considerable volume, to a point where loss of blood volume leads to failure of the peripheral circulation. This type of "shock" may be caused by severe mechanical injury, chemical agents, infection

Prompt and skilful treatment will save a considerable percentage of patients suffering from severe burns! For the first few days the problem is 'predominantly that of treating "shock." It then becomes one of control of infection; the removal as soon as possible

of skin which has been damaged beyond repair, and the covering of the denuded areas with skin grafts at the earliest possible moment. If this is not accomplished, a prolonged illness ensures in which the nutrition is impaired, mostly because of a loss of protein throughout the body and in the blood itself, and a resulting relative diminution of the blood volume been poorly termed "chronic shock."

This condition has been poorly termed "chronic shock."

"Chronic shock" occurs also in many patients suffering from wating illnesses in which there is a protein deficiency, by reason of protein loss from the body or inadequate intake or both Resistance to infection and, more important to the surgeon, the ability to withstand an operation are lowered Treatment by blood transfusion, by increased intake of protein and vitamins and by other measures does much to lower the operative mortality. Particularly is this true in cancer, where the only hope of a cure or pullation often tests in radial operations

Postoperative Care.—Care of a patient following an operation involves the prevention or treatment of complications Formerly such complications were common, notably the so-called "jost-operative pneumonia" attributed incorrectly to the anaesthetic agent. With better administration of anaesthesia, particular attention to breathing, early mobilization of the patient and control of infection by the sulfonamides and antibutics, the inodence of complications decreased notably. The gwing of adequate fluids and the maintenance of nutrition also did much to avoid the postoperature discomfort and at times serious ulleas formerly occurring. There presided, however, a low but significant indeveloped to control it.

A better understanding of the process of healing led to earlier discharge of patients from the hospital, to avoid the enfeebling effect of long bed rest. This type of ambulatory rehabilitation involves both psychic and physical factors.

Specialization.—As a result of the development of new operations in fields prevously considered maccessible, and of better means of diagnosis and more highly specialized skills, surgery came to be categorically divided into certain areas for which special training is required and in which the competence of each surgeon is authenticated by the individual professional groups ophthalmology, otolarynagology, orthopaedics, urology, neurosurgery, thoracic surgery, plastic surgery, gynaecology, proctology, etc. While this partition of surgery led to greater knowledge and skill in restricted areas, it also resulted unfortunately in less knowledge and skill with respect to areas outside the specialty.

Prior to specialization, except in a few of the larger cities, there was not a large enough volume of practice in the entire field of surgery to occupy the full energies of a practitioner or to provide him with a reasonable momen. Most physicians did surgery deven those who were known to be particularly skilled in it continued general practice.

Wounds .- Surgery, while still requiring as its distinctive skill the operative procedures, does not differ fundamentally from other fields of medicine which in the same period of time underwent a similar development with an increasing knowledge of diagnosis and treatment of disease. There are many areas of common interest in which the physician and the surgeon combine their knowledge and skill. Specifically illustrative is the change that took place in the treatment of injuries. Laster's first contribution to the control of infection was in compound fractures, in which the skin had been damaged so seriously that there was direct exposure of the mjured bone and the surrounding soft tissues to the air, thus permitting contamination by bacteria. Immediate closure by a dressing with phenol (carbolic acid) which blocked off this communication mechanically and chemically enabled him to report a series of cases in which the mortality had been remarkably lowered. Previously, nearly all such injuries had become infected, and the majority of the patients died. It was considered good practice to amputate at once an extremity in which there was a severe compound fracture, in a desperate attempt to avoid this sequence of events. Unfortunately, amputation was also accompanied in the majority of instances by infection and death. Other surgeons adopted Lister's methods and modified them by applying dressings stentized by chemicals less caustic than phenol or by heat. Rigorous methods were developed to avoid direct contamination by other potential carriers of bacteria such as instruments in the hands of the operators. It was found that amputations required by irreparable injury or for other reasons could be carried out with relatively low mortality. Precautions were then adopted for all operative procedures involving incision of the skin

As bacteriology developed, it became apparent that certain organisms were responsible for the more serious infections, and that one variety was not infrequently present in the throats and noses of persons who were at the moment or had been infected by them Consequently masking of the operator and others in the operating room was introduced The rubber glove was used to prevent transfer of bacteria from the operator's hands to the wound The effectiveness of these precautions had been so satisfactory in civil life that it came as a great surprise at the onset of World War I in 1914 to find that wounds from projectiles, a large portion of which were high-explosive shells, became grossly and viciously infected. Tetanus, gas gangrene and virulent streptococcus infections were rampant Conditions in the hospitals resembled those of the American Civil War and the Crimean War, both of which antedated the contributions of Lister. Rigorous administration of tetanus antitoxin at the dressing stations, however, and improvement in the evacuation of wounded to hospitals where adequate surgical care could be given improved the situation somewhat. But the concept of the "mobile hospital" (the ambulance of Dominique Larrey, in the Napoleonic wars), in which the surgeon and operating facilities were brought close to the combat zone, although introduced was not uniformly accepted until World War II. It finally became recognized that if infection was to be controlled effective measures must be taken within six hours of the injury Foreign material such as gross dirt, patches of cloth and fragments of the projectile itself must be removed by careful block excision of the wound if possible, including all nonviable tissue. It was found possible to close a great majority of wounds at once by suture and obtain healing with little or no infection. An occasional patient, however, would develop an infection which, for lack of care, became serious. It was therefore the rule to leave these wounds open until they could be sutured a few days later at a hospital in the rear if not infected In wounds of the brain, thorax, abdomen and joints, however, it was essential that the closures be made at the time of the primary operation.

The fundamental lesson learned in World War I was that the presence of dead dissue and other foreign material is the most important factor in the incidence of infection of wounds. The lesson was confirmed and the underlying principles were followed more uniformly in World War II and the Korean war. It is probable that with the subsequent development of drugs for the world was the second of the probable of the world of the subsequent wounds can be closed at once after excision with still fewer cases of the subsequent of the duration and extent of disabilities.

It should not be assumed, however, that only in war are advances made in the knowledge of surgery and its application. The principles used in the care of wounds during war had been recognized and used by many surgeons in civilian life, and war meant only their application in mass.

Research and Education.—The surgeon is necessarily dependent upon his colleagues in other fields of medicine and in the sciences not immediately related to medicine. Pasteur, a chemist, established the science of bacteriology, while Lister applied it. W. K. Röntgen discovered X-rays, which found their use first in the diagnosis of fractures. Nuclear physicists have discovered invaluable substances for investigation, diagnosis and treatment in all fields of medicine, including surgery. Conversely, surgeons have contributed materially to the knowledge not only of disease but also of the structures and functions, normal and abnormal, of man, Major contributions resulting from clinical experiences have been reinforced by carrying problems into laboratories for research. Research in surgery, as in other sciences, represents in a large degree the area of most intensive growth. Parsicularly important in this connection is the training of surgeons. The surgeon who remains unaware of the advances in his pro-

fession, even though he does not take a productive part in them, will become increasingly ineffective as time goes by A concerted effort in the United States was directed at providing continuing opportunities of learning by those established in practice. This was one of the objectives of the American College of Surgeons, formed in 1913 and modelled upon the Royal Colleges of Surgery in Great Britain It was soon realized that more specific opportunities were necessary for the surgeon about to enter into practice, and for this several graduate schools were established which for the most part employed didactic methods of teaching Finally in 1937, following the examples of other divisions of medicine, the American Board of Surgery was established, under the auspices of the Council on Medical Education of the American Medical association, for the examination and certification of surgeons. Requirements for admission to examination, limited at the start but later more rigorous, involve a minimum of four years' training in accredited hospitals following graduation from a school of medicine, this in turn to be followed by one more year in certain institutions, or two years under suitable preceptorships. The immediate effect was to improve markedly the quality of those entering practice. As a result of these advances surgery is costly; but the financial benefits to society materially exceed the expenditures. The costs of hospitalization and the concomitant professional care are increasingly covered by various forms of insur-(See also Abdomen, Surgery of; Brain. Surgery of the Brasm; DENTISTRY; GYNAECOLOGY; HEART AND LUNG, SUR-GERY OF, ORTHOPAEDIC SURGERY; SPINAL COLUMN. SURGERY OF See also under specific diseases, eg., Bone, DISEASES AND IN-JURIES OF, CANCER; GOITRE; HAEMORRHOIDS, TUBERCULOSIS.)
Surgical Appliances.—The history of surgical instruments begins in the Neolithic or later Stone Age, when ground or polished stone weapons were used for opening the skull. In the early civilizations these were replaced by bronze and then by iron and steel.

Descriptions of surgical instruments by Greek and Roman medical writers were confirmed by the findings of modern atchaeologasts. Later pictorial representations in manuscript, the only written method of communication until the 15th century, were for the most part crude and diagrammatic. By the 16th century, for the purposes of the surgery of the time, the instrumentation was surprisingly good. As the field was subsequently broadened by advances in anatomy, physiology and pathology, new instruments were devised and the standard ones further refined.

The introduction of anaesthesia in the middle of the right century resulted in a remarkable broadening of the scope of surgery. This was followed shortly by an understanding of surgical infections and their prevention,

With the increase in the number and variety of surgical operations it was soon found that the customary instrument chest was inadequate and that the procedures for the prevention of infection in the home or in the open wards of a hospital were very difficult if not impossible. Therefore it became necessary to construct operating rooms in which the walls and floors could be maintained free from infectious agents For the same purpose the furniture within these rooms was made of metal, properly treated to prevent corrosion. Likewase, the surgical instruments were redesigned, eliminating wooden handles and crevices that made it difficult to keep them scrupulously clean.

At first chemical solutions were employed generally to avoid infection, but by 100 these had been abandoned for the most part For purposes of sterility the hands of the operator and his assistants, after thorough cleansing, were encased in rubber gloves. The area of exposure of the skin of the patient necessitated by the operation, after mechanical cleansing and treatment with an antiseptic, solution, was walled off with "drapes." These, as well as the gowns, dressings and instruments, were sterilized by subjection to high temperatures, either by boiling water or by baking in an oven. With the assistance of trained nurses and other personnel it then became possible to carry out operative procedures in all parts of the body with reasonable assurance that they would not be complicated by infection.

Consequently, in the subsequent half century the surgeon was able to keep pace with the advancing knowledge of the medical

sciences, adapting his tools and facilities to the opportunities as and copra they arose The enlargement of the field of surgery led to a high degree of specialization both in diagnosis and operative treatment, with each specialty having its own particular instruments and appliances The catalogue of a surgical supply house is a massive volume carrying many thousands of items The great majority of these are custom-made

Each operating room is in itself compact and not planned as a theatre for students or spectators Convenient dimensions comprise a floor space of 20 by 30 ft. with a ceiling of 10 ft and a capacity of 6,000 cu ft At least an equivalent cubage is required as accessory space for sterilizing equipment, dressing and wash rooms and bed accommodations for the immediate postoperative care of patients

The whole as a suite is air-conditioned at a temperature of 70° to 75° F with a relative humidity between 55 and 60 In order to avoid dust that may carry infection, the air is turned over once every 15 minutes and filtered through suitable screens About four-fifths of this should recirculate while one-fifth is introduced from without These conditions provide the optimum of comfort and safety for the patient

Static sparking of electricity which may be dangerous in the presence of anaesthetic agents is avoided by grounding apparatus and personnel Even the floor should be of a rubberoid material that is conductive of electricity and is likewise grounded. Electric outlets and switches must be gastight, and, together with other leads for air pressure and suction and similar facilities, installed in a wall panel about three feet above the floor.

There is no fixed furniture within the operating room, and apparatus that is necessary in any specific operation is moved in at the time, for the purpose of ease of handling this is mounted upon large swivel casters with ball bearings. Aside from the anaesthesia apparatus, these are for the most part instrument and operating tables The latter are usually designed for multiple nurposes. They may be raised and lowered as well as rotated and tipped as deemed desirable by the operator. Nevertheless, each of the various specialties may require a table that is adapted to its own procedures.

Covers, gowns and hoods as well as surgical gauze are sterilized after being bundled in large autoclaves (pressure cookers) adjacent to the general supply rooms of the hospital, while small sterilizers of this same type, for instruments and solutions to be used in the operating rooms, are installed close at hand. At the tute of the operation these are assembled in an orderly fashion upon ancillary tables convenient to the operation.

The surgical instruments proper are stored in cabinets, preferably in a common room which is under close supervision by the administrative staff. When needed the appropriate set is sterilized and placed on the instrument table in the operating room. The number of these varies with the operation; in a major procedure, such as a radical operation for tumour of the breast or of the brain, a considerable variety and a large number may be required, BIBLIOGRAPHY —E. R. Carling and J. P. Ross (eds.), British Surrical Practice (London, 1947); Allen O. Whipple (ed.), Nelson New Loose Leaf Surgery (1927), Frederick Christopher (ed.), A Textbook of Surgery, 4th ed. (1948).

SURICATE or MEERKAT (Suricata suricata), a small South African mammal of the Viverridae, ranging from Cape province to the Transvaal. The head and body are about 14 in, long and the tail half as much; the fur is long and soft, light grizzled gray in colour and banded with black on the lower part of the back. Meerkats are sociable animals, living in holes in the rocks on the mountains and burrowing in the sandy soil of the plains. They feed chiefly on succulent bulbs, which they scratch up with long curved, black claws on their forefeet. They are often domesticated as pets. (See CARNIVORA.)

SURIGAO, a municipality, capital and port of the province of Surigao, which is located in northeast Mindanao, and adjacent small islands, Philippines, 459 mi, from Manila. Pop. (1948) 46,109 (a gain of 29,877 since 1918). Timber is in the neighbouring forests, and there are gold and iron deposits in the region. The chief agricultural products are abacá (Manila hemp), maize (corn)

(C.S L; X) SURINAM: see GUIANA. Surinam or Dutch Guiana.

SURINAM TOAD (Pipa pipa), an aglossal (tongueless), tailless Amphibian (qv). It inhabits South America east of the Andes and north of the Amazon and 1s thoroughly aquatic. It has an extremely flattened head, the snout and the angles of the jaws bear several lappets, the fingers terminate in a star-shaped appendage and the eyes are minute and without lids

The eggs are carried on the back by the mother, and the skin thickens and grows round the eggs until each is enclosed in a dermal cell, which is finally covered by a horny lid The eggs may number about 100 and measure 5-7 mm in diameter They develop entirely within these pouches, and the young hop out in perfect condition. Pairing takes place in the water, the male clasping the female round the waist During oviposition the cloaca projects from the vent as a bladderlike pouch, which is inverted forward, between the back of the female and the breast of the male, and by this means the eggs are evenly distributed over the hack

See Gadow, Amphibia and Reptiles (1901)

SURMA or BARAK, a river of Assam, India, and East Bengal, Pak It rises in the Barail range to the north of Manipur, its sources being among the southern spurs of Japvo Thence its course is south with a slight westerly bearing, through the Manipur hills. The name "Barak" is given to the upper part of the river, in Manipur and Cachar. A short distance below Badarpur in Cachar it divides into two branches. The northern, which passes Sylhet, is called the Surma. The southern, which is called the Kustara, subdivides into two branches, one called Bibiana or Kalnı, and the other the Barak, both of which rejoin the Surma. At Bhairab Bazar in Mymensingh the Surma unites with the old channel of the Brahmaputra and becomes known as the Meghna until it joins the Ganges between Narayangan; and Chandpur

The river is navigable by steamers as far as Silchar in the rains.

The total length is about 560 mi. SURPLICE (Lat. super, over, and pellicia, furs), a liturgical vestment of the Christian church. It is a tunic of white linen or cotton material, with wide or moderately wide sleeves, reaching, according to the Roman use, barely to the hips, and elsewhere in the churches of the Roman communion to the knee It is usually decorated with lace. The surplice originally reached to the feet, but as early as the 13th century it began to be shortened. In the 15th century it still fell to the middle of the shin, and it was not till the 17th and 18th centuries that it was considerably shortened. It underwent other, more drastic modifications in various places in the course of time, and subsidiary forms were developed alongside the original type. Such were the sleeveless surplice, which was provided at the sides with holes to put the arms through the surplice with slit-up arms or lappels (so-called "wings") instead of sleeves; the surplice of which not only the sleeves but the hody of the garment itself were slit up the sides; and a sort of surplice in the form of a bell-shaped mantle, with a hole for the head, which necessitated the arms being stuck out under the hem. The first two of these forms were developed early, and in spite of their prohibition by a number of synods (eg., that of Liège in 1287) they survived in various places to modern times. The latter two only appeared after the close of the middle ages, the first in south Germany, the second more especially in Venetia, where its use is attested by numerous pactorial records. As a rule, however, these subsidiary forms of surplice were worn mostly by the lower clergy. They were the result partly of the influence of secular fashions but more particularly of considerations of convénience.

The surplice belongs to the vestes sacrae though it requires no benediction. It is proper to all clerics, even to those who have only received the tonsure, the bishop himself vesting with it those who have been newly tonsured by him. Its use in divine service is varied. It is worn in choir at the solemn offices; it is the official sacral dress of the lower clergy in their liturgical functions, it is worn by the priest when administering the sacraments, undertaking benedictions and the like.

The older history of the surplice is obscure. Its name is derived

from the fact that it was formedly put on over the fur garments which used to be worn in chuich as a protection against the cold In all probability the surplice is no more than an expansion of the ordinary liturgical sib, as a result of the necessity for wearing it over thick furs. It is first mentioned in the 17th century, in a canon of the symod of Coyaca in Spain (1050) and in an ordinance of King Edward the Confessor. In Haly it was known at least as early as the 12th century. It probably originated outside Rome and was imported thence into the Roman use.

Originally only a choir vestment and peculiar to lower clergy, it gradually (certainly no later than the 13th century) replaced the alb as the vestment proper to the administering of the sac-

raments and other sacerdotal functions

In the oriental rites there is no surplice nor any analogous vestment. Of the non-Roman Catholic churches in the west the surplice was continued in regular use only in the Lutheran churches of Denmark, Norway and Sweden and in the Church of England

Church of England.-The surplice was prescribed by the second prayer book of Edward VI as, with the tippet or the academical hood, the sole vestment of the ministers of the church academical nood, the sole vestment of the ministers of the church at "all times of their ministration," the rochet being practically regarded as the episcopal surplice. Its use was furnously assailed by the more extreme reformers but, in spite of their efforts, was retained by Elizabeth's Act of Uniformity and enforced by the advertisements and injunctions assued under her authority. which ordered the "massing vestments" (chasubles, albs, stoles and the like) to be destroyed (see VESTMENTS). Its use has never been confined to clerks in holy orders, and it has been worn since the Reformation by all the "ministers" (including vicars-choral and choristers) of cathedral and collegiate churches, as well as by the fellows and scholars of colleges in chapel. The distinctive mark of the clergy has usually been the tippet or scarf, a broad band of black silk worn stolewise but having no liturgical significance The surplice was formerly worn by the clergy only when conducting the service, being exchanged during the sermon for the "black gown," but this custom became almost completely obsolete. The traditional form of the surplice in the Church of England is that which survived from pre-Reformation times; viz., a wide-sleeved, very full, plain, white linen tunic, pleated from the yoke and reaching almost, or quite, to the feet. Toward the end of the 17th century, when large wigs came into fashion, it began for convenience to be constructed gownwise, open down the front and buttoned at the neck, a fashion which partially survives, notably at the universities.

SURPLUS PROPERTY DISPOSAL (U.S.). Surplus properly disposal was first recognized as a special function in 333 when the procurement division of the U.S. treasury department was assigned responsibility for disposing of the surplus property of World War I and even some property dating from previous wars.

World War II increased the importance and, in an enormous degree, the magnitude of the task. At a breath-taking pince war production rushed to meet the demands of modern war. A virtually endless assortment of property of almost very description began to accumulate as surplus as the war developed and war requirements changed. Implements became outmoded almost before they had left the production line; for example, 800 modifications were made in the original specifications of the B-17 bomber each involving thousands of "change orders" and throwing into the surplus hap millions of parts.

At the request of Pres. Franklin D. Roosevelt, Bernard Baruch and John Hancock made a report which, among other things, recommended a central authority. The Surplus War Property administration (S.W.P.A.) was created under an executive order of Feb. 79, 7944, and charged by the president with general supervision and directions of the surplus disposal unorgam.

On Oct, 3, 1044; the Surplus Property act was approved. Its major sins, while conflicting in some respects, were to make maximum uses of surplus property, establish a system of priorities for the disposal todgetuplus and to use existing facilities for additional confliction of the disposal. The act created a three-member hoard to carry out its proxisions;

On Sept 18, 1945, congress amended the act to replace the board by a Surplus Property administration headed by a single surplus property administrator. The centralization of authority in one individual was the only effect of the amendments, the SPA carried on the same functions as the predecessor board The two final redistributions of the functions originally assigned to the Surplus Property board were brought about by an executive order effective Feb 1, 1946. By that time the SPA had largely completed an initial task of policy formation. World War II was over, and surplus was accumulating at an increasing pace. The time for more active disposal had arrived. The executive order accordingly provided for the abolition of S.P.A. and for the transfer of its function to the War Assets corporation. Excluded from the transfer was authority over surplus property abroad, which became the responsibility of the state department. As a result of the same order, the War Assets administration came into being on March 25, 1946, taking over the functions of the W A C.

Previously the various disposal agencies had operated under and as subsidiaries of other and more permanent agencies using the facilities of such agencies for actual disposal operations. The WAA, however, was created as a separate unity. It co-operated with other agencies but functioned primarily on its own, handling the entire disposal program for more than own, of all summits.

Of the \$27,100,000,000 worth of war surplus property declared to the War Assets administration, \$25,500,000,000 had been disposed of by Oct. 1, 1949. In that year the W.A.A. was abolished and its functions were transferred to the General Services administration for the express purpose of lequidation. (H. E. Br.; X)

SURRENDER, m law, a mode of alienation of real estate its defined by Lord Coke to be "the yielding up of an estate for life or years to him that hath an immediate estate in reversion or remander" (Coke upon Littleton, 327 b). It is the conveyance by the reversioner or remainer man to the tenant of the particular estate. A surrender was then usual means of effecting the alienation of copyholds (q.v.). A surrender was required, after the Real Property act, 1845, to be by deed, except in the case of copyholds and of surrender by operation of law. (See REMANDER, REVERSION)

In Scots law surrender of a lease is represented by renunciation. The nearest approach to surrender of a copyhold is resignation in remanentiam (to the overlord) or resignation in fourorm (to a purchaser). These modes of conveyance were practically

superseded by the Conveyancing act, 1874.

In the U.S. surrender divides itself unto express surrender and surrender by operation of law. The former is the surrender known to the early common law; the latter takes place when the tenant and the reversioner have performed acts inconsistent with the continued existence of the two former distinct estates, from which acts the law implies that a surrender has been made. Thus where there is an acceptance by the tenant of a new lease to begin at any time during the ensience of the previous lease, or the relinquishment of possession by the tenant and the resumption of possession by the landlord, a surrender by operation of law is deemed to have taken place.

SURRENTUM: see SORRENTO.

SURREY, EARLDOM OF. This carldom is of uncertain but unquestionably early origin. A Norman count, William de Warenne (c. 1030-88), is generally regarded as its first holder and is thought to have been made an early by William II about 1088. William and his successors were styled earls of Surrey or Earls Warenne indifferently, and the family became extreme the william, the grd earl, filed in 1148. The second family to hold the earldom of Surrey was descended from Isabel de Warenne (d. 1799), daughter and heiress of Earl William, and her second husband, Hannelm Plantagenet (d. 1202), an illegitimate half-brother, of King Henry II. Their descendants held the earldom until Earl John died without legitimate issue in 1347.

The earldom and estates of the Warennes now passed to John's nephew, Richard Fitzalan, earl of Arundel (c. 1307-76), being forfeited when Richard's son, Richard, was beheaded for treason in 1337. Then for about two years there was a duke of Surrey, the title beans borne by Thomas Holand, earl of Kent (1374-

SURREY 607

1400), from 1397 until his degradation in 1309. In 1400 Ruchard fritalan's son, Sr. Thomas Fitzalan' (3361-1425), was rectoached in his father's honours and became earl of Arundel and earl of Surrey, but the latter earlboarn reverted to the Crown when he died. In 1451 John Mowbray (1444-1476), afterwards duke of Norfolk, was created earl of Surrey but the title died with, him.

Norfolk, was created earl of Surrey, but the tule died with him.

The long connection of the Howards with the earldom of Surrey began in 1483 when Thomas Howard, afterwards duke of Norfolk, was created earl of Surrey Since then, with brief exceptions, the title has been borne by the duke of Norfolk.

See the articles NORFOLK, EARLS AND DUKES OF, and ARUNDEL, EARLS OF, also G E. C. (ockayne), Complete Perage, vol vii (1806).

SURREY, HENRY HOWARD, EARL OF (15187-1547), English poet, son of Lord Thomas Howard, afterwards 3rd duke of Norfolk, and his wife Elizabeth Stafford, daughter of the duke of Buckingham, was born probably in 1518 He succeeded to the courtesy title of earl of Surrey in 1524, when his father became duke of Norfolk His early years were spent in the various houses of the Howards, chiefly at Kenninghall, Norfolk; he used also to stay at Windsor with young Henry Fitzroy, duke of Richmond, of whom his father was guardian. Anne Boleyn tried to arrange a marriage between the princess Mary and her kinsman, Surrey The Spanish ambassador, in the hope of detaching the duke of Norfolk's interest from Anne Boleyn in favour of Catherine of Aragon, seems to have been inclined to favour the project, but Anne changed her mind, and as early as October 1530 arranged a marriage for Surrey with Lady Frances de Vere, daughter of the 15th earl of Oxford This was concluded at the earliest possible date, in February 1532, but in consequence of the extreme youth of the contracting parties, Frances did not join her husband until 1535. In October Surrey accompanied Henry VIII to Boulogne to meet Francis I., and, rejoining the duke of Richmond at Calais, he proceeded with him to the French court, where the two Englishmen were lodged with the French royal princes Surrey created for himself a reputation for wisdom, soberness and good learning Meanwhile in spite of his marriage with Frances de Vere, the project of a contract between him and the princess Mary was revived in a correspondence between the pope and the emperor, but rejected by the latter Surrey returned to England in the autumn of 1533, when the duke of Richmond was recalled to marry his friend's sister. Mary Howard Surrey made his home at his father's house of Kenninghall, and took his father's side in a dispute which led to a separation between the duke and duchess.

In May 1536 he filled his father's functions of earl marshal at the trial of his cousins Anne Boleyn and Lord Rochford'. In the autumn of that year he look part with his father in the bloodless campaign against the rebels in Vorshave and Linconshire, in the "Pilgrimage of Grace" Hasty in temper, and by no means friendly to the Seymour faction at court, Surrey struck a man who insanuated that he had secretly favoured the insurgents. For breaking the peace in the king's domain he was arrested (1757), but thanks to Cromwell, he was merely sent to reside for a time at Windsor. During this retirement he had lesure to devote himself to poetry In 1539 he was again received into favour In May 1540 he was one of the champions in the iosust celebrated at court.

The fall of Thomas Cronwell a month later increased the power of the Howards, and in August Henry VIII. married Sur-rey's cousin, Catherine Howard. Surrey was knighted early in 344, and soon after he received the Gaster and was made chancellor of the duchy of Lancaster. In 1542 he was imprisoned again for quarrelling, but was soon liberated. Shortly after his re-lease he joined his father on the Scottish expedition They laid waste the country, but retreated before the earl of Huntly, taking no part in the victorious operations that led up to Solway Moss.

Surrey's ties with Wyst, who was fifteen years his closer and of opposite politics, seem to have been rather literary than personal. He appears to have entered into closer relations with the younger Wyst, with whom he got into trouble for breaking the windows of the citizens of London on Feb. 2, 7543. In prison for this offence he probably wrote the satire on the city of London, in which he explains his escapade by a desire to rouse Londoners to a sense of their wickcheness. In October he joined the English army

co-operating with the imperial forces in Flanders, and in the campaign of the next year he served as field marshal under his father, and took part in the unsuccessful siege of Montreuil. In August 1565 he was again serving in France

Surrey had always been an enemy to the Seymours, whom he regarded as upstarts, and he thwarted the proposed marriage of his sister, the duchess of Richmond, with Sir Thomas Seymour, He thus increased the enmity of the Seymours and added his sister to the already long list of the enemies which he had made by his haughty manner and brutal frankness. He was now accused of quartering with his own the arms of Edward the Confessor The charge was a pretext covering graver suspicions Surrey had declared that his father, the duke of Norfolk, as the premier duke in England, had the obvious right of acting as regent to Prince Edward He also boasted of what he would do when his father had attained that position. This boast was magnified into a plot on the part of his father and himself to murder the king and the prince. The duke of Norfolk and his son were sent to the Tower on Dec. 12, 1546 The duchess of Richmond was one of the witnesses (see her depositions in Herbert of Cherbury, Life and Reign of Henry VIII., 1640) against her brother, but her statements added nothing to the formal indictment. On Jan. 13. 1547 Surrey defended himself at the Guildhall on the charge of high treason for having illegally made use of the arms of Edward the Confessor, before hostile judges. He was condemned by a jury, packed for the occasion, to be hanged, drawn and quartered at Tyburn This sentence was commuted to beheading Surrey was executed on Tower Hill on the 10th of the month

Surrey's name has been long connected with the "Fair Geraldine," to whom his love poems were supposed to be addressed. The story is founded on the romantic fiction of Thomas Nashe. The Unfortunate Traveller, or Life of Jack Wilton (1594), according to which Surrey saw in a magic glass in the Netherlands the face of Geraldine, and then travelled throughout Europe challenging all comers to deny in full field the charms of the lady At Florence he held a tournament in her honour, and was to do the same in other Italian cities when he was recalled by order of Henry VIII. The legend, deprived of its more glaring discrepancies with Surrey's life, was revived in Michael Drayton's England's Heroicall Epistles (1598) Geraldine was the daughter of the earl of Kildare. Lady Elizabeth Fitzgerald, who was brought up at the English court in company with the princess Elizabeth (See James Graves, a Brief Memoir of Lady Elizabeth Pitzgerald, 1874) She was ten years old when in 1537 Surrey addressed to her the sonnet "From Tuskane came my ladies worthy race," and nothing more than a passing admiration of the child and an imaginative anticipation of her beauty can be attributed to Surrey

His poems, which were the occupation of the leisure moments of his short and crowded life, were first printed in Songs and Sonsteins written by the rygit homomable Lorde Henry Howard late Earls of Surrey, and other (apud Richardum Tothet, 1557). A second edition followed in july 1557, and others in 1599, 1565, 1567, 1574, 1585 and 1587 Although Surrey's name, probably because of his rank, stands first on the title-page, Wyat wag the earlier in point of time of Henry's "courtly makers." Surrey, indeed, expressly acknowledges Wyat as his master in poetry. His sonnets, his elegy on Wyat and his lyrics served as models to renerations of court books.

As their poems appeared in one volume, long after the death of both, their names will always be closely associated. Surrey's contributions are distinguished by their impetuous cloquence and sweetness, and he introduced new smoothness and fluency into side the Miscellary His translation of the second and fourth books of the Aensel into blank verse—the first attempt at blank verse the English—was published separately by Tottel in the same year Certain Books of Virgiles Aensis turned into English meter.

See Professor. E. Arber's regions on write the surgain reservafine the professor of the seed of the seed of the seed of the depths, 1800); the Southernic Chin reprint of Certain Boke of Vinland of Survey (1815); and The Podical Works of Heavy Howard, Earl of Survey (Aldine edition, 1866). The best account of Survey's life is in Edmond Bayest Deux Genilhommer-point de la cour de Heavy 608 SURREY

VIII (1891), which rectifies Dr. Nott's memoir in many points. See also Brewer and Gairdner, Letters and State Papers of Henry VIII, Lord Herbert of Cherbury, Life and Raigne of Kinge Henry the Eighth (1649), J. A Froude, History of England (chs. xxi and xxll), W. J. Courthope, History of England (chs. xxi and xxll), where the extent and value of Surrey's mnovations in English poetry (are estimated; F. M. Paddiord, The M.S. Poems of Henry Howard, Earl of Surrey (1906), O Fest, "Ober Surreys Virgiludersectumg," in Paddiors, vol. xxiv (Berlin, 1930).

SURREY, a southeastern county of England, bounded north by the Thames, separating it from Buckinghamshire and Middlesex, east by Kent, south by Sussex, and west by Hampshire and Berkshire. The administrative county of London bounds that of Surrey (south of the Thames) on the northeast. The area is 721 6 sq.mi. The north of the county is low lying, the eastern part consisting of the London clay, the western of the Bagshot beds Near the western boundary the land rises into the low Chobham ridges. Across the middle of the county, from east to west, run the North downs, composed of chalk. In the east they form a wide band with an extreme height of 852 ft., but westward they narrow into the Hog's Back The line of the Downs is broken at two points; by the river Mole between Dorking and Leatherhead, and by the Wey near Guildford. These are the two chief rivers in the county, and they join the Thames at Molesey and Weybridge respectively. The northern slopes of the Downs are flanked by a narrow strip of Lower London Tertiary beds, the southern by narrow bands of Upper Greensand and Gault. These beds, like the chalk, have a wider extent in the east than in the west. To the south of the Gault is a wide band of Lower Greensand, which narrows eastward. On this greensand is found the highest land in the county, Leith Hill (965 ft.) near the centre, and Devil's Punch Bowl (895 ft ) in the west. The rest of the county, except for a small triangle of Hastings beds in the extreme southeast, is composed of Weald clay.

The chief evidence of the presence of Palaeolithic man in Surrey comes from various gravels near Limpsfield (in the east of the county), near Guildford and Godalming, and near Farnham. The Weald region in early times was very thickly forested, and traces of Neolithic man, indicated by finds of implements, are therefore most numerous on the chalk and greensand, especially in the west, but finds of this age are not rare on the lower lands in the northeast of the county. Bronze weapons have not been found in such great numbers as those of stone, but their distributions are, roughly, coincident except that the metal weapons have been found at several places along the Thames Near the chalk ridge of the North downs runs the ancient track of the Pilgrims' way A track here was used in very early times to connect the cultural centre of Kent with Hants and Wiltshire; in the middle ages the route regained importance as the path of pilgrims from the west to the shrine of St. Thomas at Canterbury. The Romans did not occupy Surrey very closely, but there are traces of their influences in the remains of one or two small settlements and a few villas.

The county was penetrated by the English invaders at a fairly early date, and its position between the Thames and the Weald decided its northern and southern borders. The Kentish boundary probably dates from the battle of Wibbandune, between Ethelbert of Kent and Ceawlin of Wessex, while the western limit in a wild, uncultivated district was not then strictly defined. In the 7th century Surrey was under the overlordship of Wulfarer, king of Mercia, who founded Chertsey abbey, but in \$32, when the Mercians were defeated by Eghert of Wessex, it was included in the kingdoin of Wessex, as the Audio-Saxon Chronicle relates.

Surrey was constantly overrun by Danish hordes in the oth century and until pose was established by the accession of Conute. In 857 a great pational victory over the Danes took place at Octley, near Leith. Hill. The Norman army traversed and ravaged the county, in their march on London. A large portion of the county having been in the hand; of Edward and Harold, fell to the share of William, threshif is the noist inportant tenants in chief being Odo of Bayoux. and Alichard. de Tonbridge, son of Count Gilbert, attenwades "de-Glare." The church also had large possessions in the county of the county

dreds was 14 as now, but the hundred of Farnham was not so called, the lands of the bishop of Winchester being placed in no hundred, but coinciding with the present hundred of that name. The western boundary of the county was probably definitely fixed about this time Until quite recently Surrey had never been in any diocese but Winchester, of which it was an archdeacoury in the 12th century. Croydon was a peculiar of Canterbury, in which diocese it was included in 1201. The shire court was almost certainly held at Guildford, the seat of the royal court at times during the reigns of John and Henry III. From 1290 to 1832 the share returned two knubits to parlament.

Architecture.-The only ecclesiastical ruins worthy of special mention are the walls of Newark priory, near Woking, founded for Augustinians in the time of Richard Coeur de Lion: and the Early English crypt and part of the refectory of Waverley abbey (1128), the earliest house of the Cistercians in England Among the more interesting churches are Albury (the old church), near Guildford (Saxon or very early Norman tower), Chaldon, remarkable for its 12th-century frescoes; Compton, worthy of notice for its two-storied chancel and its carved wooden balustrade surmounting the pointed transitional Norman arch separating the nave from the chancel; Leigh, Perpendicular, possessing some very fine 15th-century brasses; Lingfield, Perpendicular, containing some fine stalls (the church was formerly collegiate); Stoke d'Abernon, Early English, with the earliest extant English brass (1277). Of ancient domestic architecture, examples include Beddington Hall, retaining the Elizabethan hall, Crowhurst Place, built in the time of Henry VII, portions of Croydon palace, an ancient seat of the archbishops of Canterbury; Archbishop Abbot's hospital, Guildford, in the Tudor style; the Elizabethan house of Loseley, near Guildford; Sutton Place near Woking, dating from the time of Henry VIII, possessing curious mouldings and ornaments in terra cotta; and Ham House, of red brick, dating from 1610.

Industries.—Surrey was at first agricultural. The stone quarties of Limpsfeld and the chalk of the Downs were captured, the latter chiefly for Immemaking Fuller's carth is obtained from Reigate and Nutfled; and the facilities afforded by many small streams, and the excellent sheep pasture, made it of importance in the manufacture of cloth, of which Guilder's was a centre. Glass, at Chiddingfold as early as 1266, and iron were made in the Weald district, whose forests produced men because and the macessary charcoal for smelting. Chilworth was famous for its prower mills in the 46th century. The carliest Delft ware munifactory in England was at Lambeth, which remains a centre of eartherware manufacture.

The total acreage under crops and grass in 1939 was 171,652, of which 44,199 ac. were arable land. This represents 9,6% of the total area (excluding water) of the county. Wheat and oats were the chief grain crops, with 7,632 ac. and 6,910 ac respectively; mangolds and turnips and swedes occupied 3,373 ac., while the area under potatoes was 2,469 ac. Clover and rotation grasses for hay took up 5,728 ac. and orchards 1,410 ac Signif best made a start with 20 ac During the first two seasons Signif best made a start with 20 ac During the first two seasons with the control of the dairy type, the milk being sain to London, while sheep are reared on the chilk downs. A large area is occupied by market gardens on the alluvial soil along the banks of the Thames, The National Trust owned 4,873 ac in Surrey in 1942.

The county is chiefly residential, for those people who have business interests in London. Manufactures are chiefly confined to London and its immediate nelighbourhood, though gloves and hosiery are made at Godalming, and oil-paper, sunif and sheet ron, for which there are numerous mills, on the Mole and Wandle. There are also paper mills, and brush and broom making is a considerable business. Communications include the navigation of the Thames and Wey, and the Basingstoke canal, communicating with the Wey from Frindley and Woking The county is served by the Southern railway, whose lines intersect the county from north to south and from east to west. There were 685 mi of roads, in 1942. Near Croydon is the London terminal aero-drome.

istrative county is 701 8 sq mi., with population (1951) of 1,351,-963. Population movements as a result of World War II had caused no change in the Surrey population up to Feb 1941. It was the only English county unaffected The county contains 14 hundreds Croydon is a county borough, and the 13 municipal boroughs are Barnes, Beddington and Wallington, Epsom and Ewell, Godalming, Guildford, Kingston-upon-Thames, Malden and Coombe, Mitcham, Reigate, Richmond, Surbiton, Sutton and Cheam, and Wimbledon There are seven parliamentary divisions -Chertsey, Fainham, Mitcham, Epsom, Eastern, Reigate, Guildford-each returning one member. Croydon returns two members. and Richmond, Kingston and Wimbledon one member each The assizes and county quarter sessions are held at Kingston, where, also, the county council sits. Croydon and Guildford have separate courts of quarter sessions. There are 12 petty sessional divisions After 1876 Surrey, with the exception of 10 parishes, was not included in any circuit, though commissions are issued not less than twice a year for the discharge of civil and criminal business. The central criminal court has jurisdiction over the ten parishes, which are adjacent to London. All those civil parishes within the county of Surrey, of which any part is within 12 mi of, or of which no part is more than 15 mi. from, Charing Cross, are in the metropolitan police district. The county is mainly in the dioceses of Southwark (1905) and Guildford, the latter having been created in 1927 from Winchester. Of the two archdeaconries, Dorking was created in 1928 A small portion in Canterbury diocese includes the archdeaconry of Croydon.

SURROGATE, a deputy of a bishop or an ecclesiastical judge, acting in the absence of his principal and strictly bound by the authority of the latter (Lat. surrogare, to substitute for) Canon 128 of the canons of 1603 lays down the qualifications necessary for the office of surrogate, and canon 123 the regulations for the appointment to the office. The office is of some importance in the United States as denoting the judge to whom the jurisdiction of the probate of wills, the grant of administration and of guardianship is confided

SURTAX. A surtax is any levy designated as such by the taxing authority, usually imposed as a supplement to a normal tax, standard rate or other existing tax. In America and the British Commonwealth, surtax is commonly associated with progressive income taxation. One of the most famous is Britain's surtax on personal income over £5,000, dating back to its 1909 super-tax; 1954 surtax rates, for example, ranged from 5% to 50% (atop the 45% standard rate). Except for a vestigual 3% normal tax, the entire U S. personal income tax was labelled "surtax" beginning in 1944 Canada's income tax includes a low-rate surtax on investment income. (See Income Tax: in Practice.) (W. W. Hr.)

SURTEES, ROBERT SMITH (1803-1864), English novel-ist and sporting writer, was the second son of Anthony Surtees of Hamsterley Hall, Durham. Educated to be a solicitor, Surtees soon began to contribute to the Sporting Magazine, and in 1831 he published a treatise on the law relating to horses and particularly the law of warranty, entitled The Horseman's Manual In the following year he helped to found the New Sporting Magazine, of which he was the editor for the next five years. To this periodical he contributed between 1832 and 1834 the papers which were afterwards collected and published in 1838 as Jorrocks's Jaunts and Jollities. This humorous narrative of the sporting experiences of a cockney grocer, which suggested the more famous Pickwick Papers of Charles Dickens, is the work by which Surtees is chiefly remembered, though his novel Handley Cross, published in 1843, in which the character of "Jorrocks" is reintroduced as a master of fox-hounds, also enjoyed a wide popularity.

Population and Administration .- The area of the admin- The former of these two books was illustrated by "Phiz" (H. K. Browne), and the latter, as well as most of Surtees's subsequent novels, by John Leech, whose pictures of "Jorrocks" are everywhere familiar and were the chief means of ensuring the lasting popularity of that humorous creation. Surfees wrote other novels, the last of which, Mr Facey Romford's Hounds (1865), appeared after the author's death (March 16, 1864).

Lang, Dictionary of Anonymous and Pseudonymous Literature of Great Brain (4 vols, Edmburgh, 1852–1864).

SURVEYING, the technical term for the art of determining the position of objects on the surface of the ground, for the purpose of making therefrom a graphic representation of the area surveyed. The general principles on which surveys are conducted and maps constructed from such data are in all instances the same, certain measures are made on the ground, and corresponding measures are protracted on paper on whatever scale may be a convenient fraction of the natural scale. The method of surveying varies with the magnitude of the survey, which may embrace an empire or represent a small plot of land All surveys rest primarily on linear measurements for the direct determination of distances; but linear measurement is often supplemented by angular measurement which enables distances to be determined by principles of geometry over areas which cannot be conveniently measured directly.

History.-It is very probable that surveying had its origin in ancient Egypt. But long before the dynastic period in Egypt, we may imagine that neolithic man was able, like the savages of to-day, to make a rough kind of map based on his journeys, or a primitive plan to show tribal or property boundaries. Apart from such speculations, however, we find, in a Theban tomb of the XVIII. dynasty, a plan of the villa of a great Egyptian noble: in the tomb of one Menna at Thebes, there is a representation on the walls of two chainmen surveying a field of corn: and in Ptolemaic and Roman papyri in the same country, measurements of plots of land are described. That the early Egyptians could carry out measurements with a considerable degree of accuracy,

is certain from a study of the dimensions of the Great Pyramid. In Roman times we meet with the groma, which consists of two pairs of plumb-lines suspended from the ends of two horizontal rods, at right angles to each other: the use of the instru-

THE U.S. BUREAU A PLAN MADE BY GEORGE WASH. their slow voyage from the Indus INGTON IN 1746, INSCRIBED IN HIS to the Persian gulf three cen-OWN HANDWRITING

ment being to lay out lines at right-angles. The metal parts of one of these gromas was found in 1912, in Pompeii. An early grorna of the same type, but rougher construction has been found in Egypt. The Romans also used to foot rods, and bronze terminal pieces of such rods have been found at Enns in Austria, the foot in this case being 13.2 inches. The Romans certainly made use of an instrument not unlike the plane-table for determining the alignment of their roads. The Greeks used a form of log line for recording the distances run from point to point along the coast whilst making

turies B.C. Still earlier (as early as 1600 B.C.) it is said that the Chinese knew the value of the loadstone and possessed some form of magnetic compass. The earliest maps of which we have any record were based on inaccurate astronomical determinations; not till mediaeval times, when the Arabs made use of the astrolabe (q.v), could nautical surveying really be said to begin. In 1450 the Arabs were acquainted with the use of the compass, and could make charts of the coast-line of those countries which they visited. In 1498 Vasco da Gama saw Guiarati. Plane-tables were in use in Europe in the 16th century and the principle of graphic triangulation and intersection was practised by surveyors in England and elsewhere. In 1615, Willebrord Snell, the Dutch mathematician, measured an arc of meridian, by instrumental triangulation.

The Different Kinds of Surveys .- Surveys may be classed in a variety of different ways. We may describe them by their scales, as large-scale or small-scale; the large-scale surveys would be those on a scale larger than, let us say, 1.25,000 On the other hand small-scale surveys would be those on scales of 1'25,000. and smaller. Or we may describe surveys by the technical method employed Thus we sometimes find the expressions, trigonometrical survey, compass survey, chain survey. Or surveys may be described by the purpose for which they are carned out. There are for instance, geodetic surveys, of which one of the chief objects will be the furtherance of the study of the figure of the earth and allied matters; cadastral surveys, whose purpose is to facilitate the collection of land revenue, hydrographic surveys, the purpose of which is the production of charts of the sea, for use in navigation, railway surveys, which are carried out to enable a line of railway to be economically located; and so on. Or we may describe a survey by the character of the resulting map. A topographical survey is intended to determine and depict the relative positions of the surface features of the earth, such features being either natural or artificial. A topographical map differs from a cadastral man in that the latter does not show any natural surface features which do not affect property boundaries.

Methods of Survey.-The simplest and most ancient method of making a plan or map is by means of direct measurement on the ground, with a rope, a chain, or a tape, of known length, suitably divided. As a simple illustration let us take the case of a level field of which a plan is wanted.

Suppose the field is as represented in fig. 1, the boundaries of Suppose the near is as represented in ig. 1, the boundaries on the field being the irregular lines ABCD. Then, to survey this field with a chain or tape, put pickets at the points ABCD, somewhere near the corners of the field, these four points being intervisible and the lines between them being free from obstruction. vising and the lines between them being free from bost duction. Then measure, with the chain or tape, the direct straight-line distances, AB, BC, CA, AD, DC, BD. This will provide the necessary frame-work. It will be seen that for the plotting of the frame-work, only one diagonal, that is, either AC, or BD, is required. The measurement of both gives a check on the work and shows the surveyor how much reliance he can place on his measurements: it also enables gross errors to be detected. This principle of providing checks, and of never depending upon one measurement, is of great importance. To survey the irregular boundaries, all that is necessary is to measure "offsets" from the main chain lines, at known distances along the lines, and to note these in the field book. The offsets are measured with an offset rod or a tape at right-angles to the chain line. With all this information in the field book there is no difficulty in plotting the

plan on paper to any scale that may be required. It is usual to lay down some limit for the offcate

An elaboration of this simple method is the scheme which was adopted by the Ordnance Survey of Great Britain and Ireland. when large-scale surveys were first commenced officially in 1825. The country was covered with a triangulation, of which the sides

FIG. 1

averaged, for the original six-inch map, some 5 miles. Each of the sides of these triangles was chained, and notes were made in the field book of points where the chain lines crossed detail, such as edges of roads, banks of streams, hedges, walls, and so on. The great triangles were broken up by other chain lines into smaller triangles, and lines tying on to these at their extremities were run along the detail to be surveyed, offsets being measured as usually.

Modern Methods.-We may now consider the system which

a chart of the coast-line of India, which was shown him by a would be adopted in a perfectly up-to-date, modern state. In such a case, there would be a geodetic survey covering the whole country with a system of triangulation of the first order; that is to say, the country would be reconnoitred beforehand, and mutually intervisible stations would be selected, some ten to thirty or forty miles apart, covering the country with a net-work, or series of chains, of triangles At the apices of these triangles horizontal and vertical angles would be observed with a theodolite, one of the triangles would be connected with a measured side, called the base or base-line From the known length of this side the lengths of all the other sides would be calculated. The latitude and longitude of one point in the triangulation would be determined by astronomical means, and also the true bearing of one line is obtained. it is then clearly possible to determine the latitude and longitude of every other point. The meaning of the term "first order." used above, is that the average triangular error of the net-work, or system of chains, of triangles, that is, the error of the sum of the 3 angles of a triangle, should not exceed one second

Now we have to hang all other surveys upon this frame-work A frame-work of the kind described has the fixed points too widely separated to be of much use for the detail survey, so the first thing to be done is to provide a closer frame-work; and this would usually be done by executing another triangulation, of less accuracy than the first, but depending upon it. There would be more points in this secondary triangulation, and the points would be distant from each other some 5 to ro miles. The triangular error would not exceed 5 seconds. If now it were required to make a map on a scale of, say, 1:100,000 the frame-work would be sufficiently close, and the detail could, in suitable country, be carried out by plane-tabling which would be based upon the points so provided

But, if it were required to construct a map on a large, cadastral scale, more fixed points still would be needed, and a tertiary tri-angulation would be carried out, depending upon the secondary work. This tertiary triangulation would have its points only a mile or two apart, and its triangular error would not exceed 15 seconds. It is now customary to classify a triangulation according to its accuracy, thus, a triangulation of the 1st order has a triangular error not exceeding a second; a triangulation of the 2nd order has a triangular error not exceeding 5 seconds; a triangulation of the third order has a triangular error not exceeding 15 seconds; and one of the 4th order has a triangular error greater than 15 seconds

But it will easily be imagined that certain areas do not readily lend themselves to triangulating, and in such areas, occasionally, traversing is resorted to for the frame-work. This will be described later. Also, in the rapid exploration of a new country it may be necessary that the frame-work be astronomical. But this is an inaccurate make-shift, and should always be avoided whenever possible.

It should be emphasized that whatever may be the extent of the area to be surveyed, whether it be a backyard or a continent, the area should be dealt with as a whole, and the frame-work should be designed to stiffen the whole area. Anyone who is charged with the execution of a survey should, therefore, carefully consider how he can best design the control or frame-work.

Bases.—The length of every side in a triangulation depends upon the length of the measured side, called the base, or base-line. Bases for geodetic work are measured with very great refinement, and the probable error of such a base would be of the order of one in one-million Such bases in times past have been measured with glass rods, wooden rods, steel bars, and compound bars of brass and steel. But now almost every accurate base, whether for geodetic purposes, or for secondary work, or for very good topographical work, would be measured with metallic (usually invar) wires or tapes supported in catenary, i.e., allowed to hang free in a natural curve, being slung over trestles. Invar is an alloy of steel and nickel, containing 36% of the latter, and this alloy is used because it has the smallest known expansion of any metal or alloy. Invar wires and tapes require, however, careful handling, and testing, and on this account are not freely used for rapid topographical bases. It is possible to get quite good along the surface of the ground.

Let us then, take the case of the measurement of a topographical base with steel tapes laid along the ground. The first thing to do is to select the site and the positions of the terminal points These must be so chosen that well-conditioned triangles can be built up on the base, connecting it with the main points of the triangulation. (See fig 2)

Then the site must be cleared of obstructions, and small undulations levelled Then the base terminals must be marked, and a

theodolite set up over one of them and directed to a pole put up over the other. Intermediate marks, in the form of pickets driven in flush with the ground, should be fixed The actual measurement is made with a steel tape, kept at a fixed tension with a spring balance, and marks are made on the tops of the pickets,

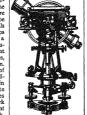

which are at tape-lengths from centre to centre; the tops of the pickets may be conveniently covered with strips of zinc, on these strips the positions of the ends of the tape are marked when measuring A convenient length of tape is 300 ft., with a width of \$ inch. A convenient tension is 20 pounds A base so measured requires corrections for standard, temperature, slope if any, and height above sea The chief difficulty in this sort of measurement

is to ascertain the temperature of the tape

A base of this kind might be some two or three miles long: but it should be remembered that it is more important to be able to extend the base by well-conditioned triangles than to measure a long base The base having been measured, it is now necessary to proceed with the execution of the triangulation Fig. 2 shows the base extension, and in the case shown, the longest side reached is more than 8 times the length of the base. so that if the base were 2 miles long, the side of the main triangulation would be more than 16 m. long

The process of triangulating consists of observing the angles at the apices of the triangles and at the two ends of the base The apices and the ends of the base must be marked The permanence of the marks will depend upon the character of the triangulation Thus, in first-order work, a mark-stone would be

buried deep in the soil, and isolated from the platform surrounding it. Vertically over the mark, when the observations were finished, a stone pıllar would be built In such work the signals would be luminous, either lamps or heliographs. But in work of a lower order the marks would usually be opaque; various different patterns have been used, poles, baskets, quadripods and so on In very rapid work the tops of spires, pagodas, temples, or solitary trees are observed too; in some cases it has been found to be useful to clear a hill of all trees but one. In very rough work sometimes the tops of prominent hills are used, without any mark

TY COURTER OF MEASUR, COOKE, TROUGHTON

The angles at these trigonometrical points of whatever order, Fig. 3 -- FIVE-INCH MICROMETER are invariably observed with a THEODOLIYE theodolite, and as this is without doubt the most important of all

surveying instruments, it is desirable to give a description of it. The Theodolite.-The theodolite is a surveying instrument consisting of two graduated circles placed at right angles to each other, for the measurement of horizontal and vertical angles. a

results from the use of ordinary steel (not invar) tapes laid or micrometer microscopes. The whole is supported by a pedestal resting on footscrews, which are also employed to level the instrument The size has varied from a minimum with circles 2 1 in in diameter to a maximum with a 36-in horizontal and an 18-in vertical circle, but these very large circles are now obsolete owing to improvements in dividing machines. The largest now in use is 12 m. in diameter.

As an example of a modern theodolite suitable for use in topographical or exploratory surveying, we may take a 5-inch transit theodolite, fitted with micrometer microscopes The accompanying fig. (3) shows such an instrument by Messrs Cooke, Troughton and Simms The instrument rests on a tripod stand, which is not shown in the figure. The levelling base has three screws. The horizontal and vertical reading circles are 5 in in diameter, and are each read, by two microscopes, by estimation to single seconds The telescope, which can be completely rotated in its horizontal bearings, has a magnification of 25 The instrument packs up in two boxes for transport. Excellent work has been done with such a theodolite all over the world. It does not appear desirable to give a more elaborate description, for the use of such an instrument can only be acquired by practice

Triangulation.-This may be carried out either in the form of cham or of a net-work (fig. 4). In a small country even the first-order triangulation might cover the land with a net-work, with sides about 30 miles long; and this was done in the case of the British Isles But in large countries such as India or the United States a very considerable saving of time and money is effected by running chains of triangles, generally north and south, or east and west Second order work may also be either in the form of chains or of a net-work; it would be dependent on the first order work, if that existed. Third order work, which is re-

quired by the detail surveyors, would usually cover the ground completely.

At each station of the triangulation the theodolite is centred over the station mark and one of the distant stations is taken as the Referring Object and the other stations are also observed in turn The first station should read about oo, the base plate being so set, and then the other stations would be observed in

order and the round of angles would close again on the first station If this round were taken with the telescope to the right, the next round would be taken with the telescope to the left. The number of rounds taken will depend on the order of the work, the zero being shifted at each round, or at each alternate round. For rapid work a good system would be First zero, o'o', telescope right; Second zero 225° 1' left Telescope right is sometimes called "Face Right," and telescope left, "Face Left."

The angles having been all booked, the means are taken, and if each angle of a triangle has been observed, it is clear that the sum of the three angles should add up to x80°, plus the spherical excess an excess which is due to the fact that the earth's surface is not plane, but is curved. Spherical excess varies directly as the area of the triangle, and may be taken to amount to 1-32 seconds for every hundred square miles, and other areas in proportion. It is generally neglected in rough work, and the excess or defect of the sum of the three angles of a triangle is, in such work, distributed equally amongst the three angles. Thus, if the sum of the three observed angles amounted to 180° 1′ 30″, each observed angle would be diminished by 30" for use in the computations.

Computations.-Over large areas, and m work which is likely to be extended to great distances, or in which, for some special reason, the geographical positions are required, it is necessary to calculate for each trigonometrical station its latitude and longitude, starting from some station for which these elements are known. But, in the case of small or isolated surveys, such elabo telescope, which turns on axes mounted centrically to the circles, ration is unnecessary, and we can proceed as follows:-Take any and an alidade for each circle, which carnes two or more verniers one station as the origin, and the meridian through that station bearing, at the origin, we shall know the azimuth of each line which radiates from the origin Then if I1 is the length of one of these lines, and if a is the angle which it makes with the initial meridian, then  $l_1 \cos \alpha$  is the north-south co-ordinate, and  $l_1 \sin \alpha$ is the east-west co-ordinate of the end of that line For lines radiating from the end of the line in question, if  $\beta$  be the angle that one of them makes with a line parallel to the initial meridian, then if le be the length of this second line, the co-ordinates of the end of it with reference to the beginning will be l2 cosβ and  $l_2 \sin \beta$ , so that the co-ordinates of any point in the triangulation, with reference to the origin, will be  $l_1 \cos \alpha + l_2 \cos \beta + l_3 \cos \gamma$ Each point in the  $+ \dots$ , and  $l_1 \sin \alpha + l_2 \sin \beta + l_3 \sin \gamma +$ triangulation can now be plotted with reference to the origin and the initial meridian, due regard being paid to the signs of the trigonometrical functions. With these co-ordinates available it is, of course, easy to compute the distance of any one point in the triangulation from any other point.

In using this sample method, we have assumed that the earth's surface is plane; actually it is a spheroidal surface. The errors involved are chiefly in a north-south direction. At sixty miles' distance from the origin the error amounts to  $\frac{1}{1000}$ , and the error increases as the square of the distance, so that at nor milles the error is  $\frac{1}{100}$ , and if we were content with this error as a maximum, we could survey a come less on this system.

Heights.-Points fixed as above described, and plotted on paper at intervals of, say, four or five inches, give a sufficient control for the horizontal work of the detail surveyor, but he will also require a frame-work of heights if he is to contour, or approximately contour, the terrain Heights may be determined in a variety of ways and with several degrees of accuracy, the most accurate method, and at the same time, the slowest and most expensive, is levelling, which will be dealt with later The next method in order of accuracy is trigonometrical determination by vertical angles, taken with a theodolite, and this will now be briefly described. On the same day that the horizontal angles are observed at a trigonometrical station, vertical angles are observed to all the distant marks, and are read on the vertical circle of the theodolite It has been found by experience that vertical refraction is least during the middle of the day, and vertical angles would, therefore, be taken between noon and three. It is best to eliminate refraction as far as possible by observing vertical angles at each of the two stations of which the difference of height is required Then it is easily shown that, if one angle is an elevation, E, and the angle at the other station is a depression, Db, then the dif-

ference of height is  $c\tan\frac{E_a+D_b}{2}$ ; or if both are depressions,—which may often happen with long rays,—the difference of height is  $c\tan\frac{D_b-D_a}{2}$  c being the distance between the two stations. If

only one angle has been observed, it will be necessary to correct this for refraction and curvature, the average amount of this correction may be taken as zoughly about 4½ seconds for every thousand feet of horizontal distance between the stations, and for other distances in proportion Barometers are best used for determining differences of height, and not absolute heights. All heights should, when possible, be based on some determination of mean sea-level, which is now the universally accepted datum.

Levelling—A "Level" is an optical surveying instrument, which, when in adjustment, has its fine of collimation horizontal; that is, the intersection of the cross-wires will cut an object, seen through the telescope, on the same horizontal plane as the optical axis. In using a level there is no need to consider the curvature of the earth, because the distances between the level and the forward and back level-staws are always kept short; in good work such a distance should not exceed go yards. If the distances in question are always kept approximately equal, any error due to faulty collimation will than to disappear. Excellent modern levels are now made which enable the observer to read the bubble without moving from the eye end of the telescope, and the instrument is finally levelled before the reading is taken. Readings at well.

as the initial meridian; then, having observed an azimuth, or true—taken on two staves, usually some ten feet long; each staff gradubearing, at the origin, we shall know the azimuth of each line which—ated in feet and tenths of feet, and hundredths may be estimated.

#### TOPOGRAPHICAL SURVEYS

The British empire affords examples of all possible methods of the survey for, and preparation of, topographical maps.

the survey for, and preparation of, topographical maps.
Great Britain itself is one of the few countries in which all
mapping is combined under one department and in which the
expense of duplicating surveys for different purposes is avoided
The six-nuch plans are used in the field for a special revision,
arranged to secure the correct information for small scale maps
The small scale maps are then drawn for reproduction by heliosincography, each scale serving as a basis for the next in order

Canada supplies excellent examples of topographical mapping and particularly so in photographic method. The one inch maps of areas in the Rocky mountains are made by ground photographic methods. A control of transgulated points is first established from the properties of the photographic party is equipped with theodolites and cameras which tupon the same stands. The cameras are so used that each portion of the ground to be mapped is photographed from two points of view on plates held in the vertical plane. The position of the camera is resected with the theodolite. The plotting is carried out during the winter recess, each photographic view being used as a record of angular measurement both horizontal and vertical. Positions are established by the intersections of rays

The survey of the Orange Free State in the Domnino of South Africa as an example of a plante table survey in country admirably suited to its use. The total area of over 50,000 square miles was mapped in 6 years by a Colonal Survey Section of 2 officers and 4 non-commissioned officers, R.E. There already existed, in parts of the area, chains of the Geodetic Survey of South Africa Based on this triangulation, the officers of the party extended a ruling trangulation of a secondary Internet (ment raingular error of less than 3 seconds). The sides of this triangulation varied from 10 of intersection and interpolation, resulted in a fixed position and height every 4 or 5 miles. Plante tabling was carried out at the scale of intersection and interpolation, resulted in a fixed position and height every 4 or 5 miles. Plante tabling was carried out at the scale of intersection and interpolation from the first position and height every 4 or 5 miles. Plante tabling was carried out at the case of intersection and interpolation from the first position and height every 4 or 5 miles. Plante tabling was carried out at the many continuous conti

An example of a different class of survey in much more difficult country is to be found in the forest regions of the Gold Coast and Sierra Leone. There is little transgulation available, nor would it be possible without heavy expense. The control, mainly astronomical and widely spaced, is provided by a special party equipped with theodolite and wireless receiving set. The detail party traverses along cleared paths with chain and compass between control points. The triangles are then cut up by a number of rope and sound traverses. Along the main traverses lines of rough levelling are run, and aneroid barometers are carried on the minor traverses. Field work is at the two-inch scale and each traverse is adjusted and compiled on a final compilation

Plane Tabling—The plane table is merely a flat board which can be attached to a tripod The board varies in dimensions from 40 in to 18 in. a side, a convenient size being 24×18 inches. The board itself is generally made of wood, somethines fitted with aluminum corners and fittings. Underneath, the board is strapped with metal, and has in the centre a ring with arrangements for statchment to the tripod The tripod, of three girder pattern legs of light wood, can be clamped to the board or left friction tight to allow of rotation. Plane tables designed for large scale surveying often include a ball and socket joint for levelling, and an instrumental slow motion in azimuth. For topographical survey the board and legs are left as simple and light as possible. On the table is mounted drawing paper or some form of celluloid.

The principal accessory to the plane table is the sight vane or alidade, which is merely a ruler with sighting vanes which can be raised or lowered at will. For engineering surveys at a largish scale a telescope with stadia hairs and vertucal circle is added to the alidade. A box compass and some form of clinometer for measuring slopes or vertical angles complete the outfit.

The first step in the field is to set the board. To do so it is

on the ground The alidade is laid on the line a b. and-standing at A .- the planetabler revolves his board until he sees B. through the sight vanes Lines can then be drawn from a towards any other points on the landscape Similar lines from b intersecting those from a. will then fix the positions This intersection is an important factor in plane tabling Even though the topographer may be given many control points fixed by the theodolite, he must amplify that control for the detail surveying he has to do. As a general rule then intersection is used today in providing the minor control for tomorrow The actual mapping is based mainly on the process known as interpolation, resection, or "making the point." This is simply to find, from the positions of three or more control points, the position at which the table is set up There are several methods of resection, the simplest of which will be described briefly.

The board is roughly set and rays are drawn backwards from three control points towards the observer; the alidade being aligned on each in turn, so that it touches its plotted position if the board has been truly set these rays will all pass through a point. If not, the true position of the observer will be nearest to the ray from the true position of the observer will be nearest to the ray from the nearest point, furthest from the ray from the most distant. Again if the three control points he round and outside the observer his position will be within the triangle of error. If the observer is outside his points his position is outside the triangle of error.

At each point so fixed the topographer sketches in the detail immediately around him, on directions drawn along the alidade, and at distances which are measured tachymetrically or by pacing or estimation. Heights are fixed by observing angles of elevation or depression and multiplying their tangents by the distances

In average country a topographer will survey a square mile or so per diem on the one inch scale, but his rate will depend greatly upon his transport Even at such scales as 3 inches to the mile, where the amount of detail to be shown demands intensive surveying rather than fast movement, a bicycle or some other transport is advisable

The scales suitable for plane tabling lie between a quarter inch and three inches to the mile. At larger scales the plane table may still be and often is used, but more as a record of instrumental measurement and less purely graphically.

Traversing.-A traverse consists of measured lengths connected by measured angles. A traverse may end upon itself forming a complete figure, in which case it is called a closed traverse More commonly it starts from one point of the triangulation and ends upon another. In cities, forests, or other areas of little visibility, the whole control may consist of a net-work of traverses.

The lengths or "legs" of the traverse may be measured in many ways. In control traversing invar or steel tapes are used in catenary (as in base measurement) or laid flat; in both cases under tension. For topographical surveying legs are measured with tapes or chains, ropes or rattans, by cyclometer or by pacing. They may also be measured optically with rangefinder, telemeter, subtense bar, or tachymeter. In geographical surveying, distances may be determined by observed differences of latitude on observed azimuths, or estimated from the time taken to travel over them on foot, horse, camel or motor car. Any class of precision may in

fact be obtained, varying in fractional error from 500,000 to 16.

The angles of a traverse may be measured with theodolite or compass, may be obtained graphically on the plane table, or estimated from the direction of a sound, generally in the form of a prearranged call or whistle from a forward observer.

In the topographical survey of a new country various classes of traversing may occur. In the Federated Malay States and in West African Colonies, precise traverses with a linear error of about 50,000 have been used as a framework or control. In the actual detail survey of forest regions minor traverses fill up the gaps between more precise and costly control traverses and afford opportunity of plotting detail. Examples of Topographical Traverses which will explain the procedure are given below.

In a recent three inch to one mile survey in Johore, the trigonometrical control consisted of a number of points assumed as errorless. Between them were run traverses with the compass and chain. The course of the traverse was cut as straight as possible.

only necessary to set a line a b on the board parallel to A B. The observer plotted his bearings and lengths on squared paper at 6 inches to the mile, including the mapping of detail and contours On reaching the closing point the traverse was adjusted graphically to its correct length, reduced to 3 inches to the mile and plotted on the plane table Errors were, in general, of the order of de The triangle of traverses was then cut up by minor traverses running straight and parallel at 200 feet intervals. These traverses were compass and "rattan" (a long creeper, marked to length, and compared each day with a standard chain). The detail and contours were mapped during the course of the traverse which was plotted direct on the plane table and seldom showed need of

As explained above traverses which are graphic in principle are adjusted graphically and proportionally In adjusting instrumental (or booked) traverses the normal rule is to adjust as follows .-

As the arithmetical sum of all x's (or y's) is to any one x (or y's) is the whole error in x's (or y's) to the correction to the corre

An adjustment on these lines gives equal weight to angular and linear measurement and admits the fact that there is, in general, no evidence on which to give preference among (i.e., to weight) the measurements

#### OPTICAL METHODS OF MEASURING DISTANCES

The ontical methods of distance measurement which are here dealt with are those which depend upon the measurement of a length from a small base at one end and the angle subtended by that base at the other. They include a number of alternatives For example the base may be fixed or variable, the subtended angle variable or fixed. The base may be at the observer's end or the far end, may be vertical or horizontal, whilst the angle may be measured by hairs or lines in the focal plane, by a micrometer scale in the focal plane, by repetition measurement on the horizontal arc, or by optical devices actually included in the base apparatus. The earliest form development took was in the use of fixed stadia hairs in the focal plane, reading, according to distance, a variable length on a vertical graduated staff. This method was later called tachymetry, or tacheometry (quick measurement) by the Italian Porro

Tacheometry or tachymetry was first outlined and applied by the English astronomer Gascoigne in 1630. Montanari, a Venetian doctor, constructed and used an instrument of similar principle in 1674. James Watt used it for surveying in the West of Scotland from 1771 onwards, and William Green, a London optician, did much to develop the method by the publication of a description in 1778. (Description and use of an improved Reflecting and Refracting Telescope and Scales for Surveying.) The unequal effect of refraction on the top and bottom lines of sight was understood by Green who called attention to the advantage of a horizontal, as opposed to a vertical, angular measurement. Nevertheless the practical convenience of the vertical staff has made it the most popular. Methods in which the base is variable but horizontal, that is a horizontal tachymetry, are sometimes known by the term telemetry. Methods in which the base is fixed (and generally horizontal) and angles read on the theodolite arcs are known as subtense, whilst the fixed base which includes its own system of angular measurement is commonly called rangefinding. The use of the various terms is, however, and must be, elastic.

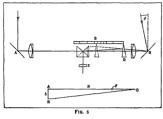

Tachymetry.-- A tachymeter (or tacheometer), in its simplest form, is only a theodolite, or telescopic alidade, provided with two horizontal wires fixed in the diaphragm at equal distances from the axis. These wires, read against a vertical graduated staff at the distant point, measure an intercept "a." The distance between the wires is so arranged that the required length "s" is some fixed multiple "k" of "a" (k usually = 100) although certain corrections may have to be applied.

The theodolite still most commonly used has a biconvex object glass and an eyepiece, and it can be shown that the point at which the subtended angle is constant lies not on the vertical axis but at a distance in front equal to f+c, where f is the focal object glass to the diaphragm.

then s=k, a+(f+c).

(k if not known must be determined by experiment ) Used in this general form for many years, the inconvenience of

the constant computation of (f+c) has led to the use of an "anallatic," or converging, lens between the object glass and the

diaphragm. Due to the Italian Porro the introduction of this lens makes it possible to measure lengths directly from the station as defined by the vertical axis of the instrument. To an increasing extent the internal focussing telescope, translating for focussing, is now replacing the older style, and in it the point of measurement is so close to the vertical axis as to result in consequent errors of an order inferior to many others which are unavoidable. (See bibliography-Henrici.)

The general equation thus becomes s=k a.

The length "s" is however the actual distance between instrument and staff, whereas surveying demands the horizontal and vertical components, and the computation of these will depend on the way in which the staff is held. Normally the staff is held vertical Let  $\theta$  be the angle of elevation, or depression, to the centre of the intercept a. Let d be the horizontal component and h the vertical component. Now the image of a will be reduced, obviously, to equal  $a\cos\theta$ , and

s=kacos0but  $d = s\cos\theta$ . Therefore d=kacos20

and h= ±dtane, or 1 kasin 20.

The rod may however be held perpendicular to the optical axis Where this is intended the staff is equipped with a device which allows the rodman to sight on the instrument. In this case if I be the length from the foot of the stave to its intersection with the produced optical axis-(the sighting point)

> then  $s = kacos\theta \pm sin\theta$ and  $d = \pm Rasin\theta \pm lcos\theta$ .

In the course of a normal tachymetric survey a very large number of points are generally fixed and the trigonometrical computation becomes irksome. There are numerous tables designed to facilitate this computation, and there are also special instrumental fittings for the same purpose. Some continental forms of tachymeter solve the triangle by scaled bars which actually form the triangle whose sides are s, d and h. The Beaman arc is a fitting used often in America. This arc is fitted against the vertical arc of the tachymeter but is independent of it and can be set to any zero. It has two scales which help in the solution of  $\cos\theta$  and of  $\frac{1}{2}\sin 2\theta$ . Some recent models give a direct reading of the horizontal and vertical components. It may be said, generally, that the tachymeter should not be used for distances of over 600 feet, that errors increase proportionally

length at stellar focus and c is the distance of the centre of the the square of the distance) and that they may be expected to reach at least one part in four hundred

Tachymetry is a medium scale method and is particularly suitable to engineering surveys, above or below ground. It is used perhaps more than any other for continental tonographical surveys at scales of 25,000 or 15,000 but is unsuitable alike for the 25 inch mapping of the United Kingdom or the small scale mapping of the Empire overseas. Used on the plane table the tachymeter is useful for traversing in difficult enclosed country or, where the control points can be seen, for measuring distances and heights to points that are immediately round the point of

Telemetry.-The very marked effect of refraction upon the precision of tachymetry has led to the use of staves in the horizontal position. The need for greater precision seems to have been felt particularly desirable for the distance between the cameras used in ground photo surveying

Subtense methods are much used in topographical and military surveys In such cases a theodolite is usually available and a subtense bar or base can be rapidly improvised. The bar or base is arranged horizontal so that the line between stations is perpendicular to it either at its centre point or at one end. The angle is measured by "repetition" on the slow motion screws of upper and lower plates. Thus, sighting on the left hand mark. the telescope is revolved with the top plate slow motion screw to point at the right hand mark. The bottom plate screw is then used to repoint on the left hand mark and the process continued until some 10 to 20 readings have been made. The whole angle is then read and divided by the number of times the measurement has been made. The general equation is

 $d = \frac{b}{-\cot^a}$  if the perpendicular is to centre point

d=b cota if the perpendicular is to end point.

Where d is the horizontal distance, b is the length of bar or base, and a the subtended angle.

The subtense base may be of any convenient size. Sometimes signals have been erected as ends of a subtense base of as much as a quarter of a mile in length the distance between being taped But subtense bars of special design, 10-20 ft, long, are the commonest form of base The end marks are often discs with black lines on a white ground For distances up to 500 yards using a rofoot subtense bar, with disc terminals, errors of the order of may be expected, but with proper precaution, good end marks, and sufficient repetition, a much higher order of precision may be obtained. The advantages of these subtense methods over tachymetry he in their greater range and precision, in the ease with which the base can be improvised, in the freedom from either a special instrument or a special staff of rodmen, and in the direct measurement of the horizontal distance,

Rangefinders.—Some rangefinders are stereoscopic in principle and resemble, in that respect, the stereoscopic plotting machines with their "floating mark" Coincidence methods have the great advantage over stereoscopic that almost everyone can use them. Moreover for this particular purpose a general plastic image is not required Errors involved in the use of the rangefinder, for any given base and magnification, are proportional to the square of the distance and an error of 18 may be taken as normal at a range of 250 yards with a 31 5 inch (8 cm.) magnification 8 model. Models reach 100 feet in base length and 28 in magnification With a 1 metre base and magnification 20 the fractional error is less than at 500 yards. An increasing survey use is being made of this rangefinder. In Canada, Egypt and elsewhere surveyors are finding its advantage over the tachymeter in the independence of rodmen and the increased speed In Canada it has been, and is, used in the control of river and lake traverses on which the surveys, nowadays mainly air photo-surveys, of the northern territories are based. Obviously the rangefinder would prove useful in medium scale plane tabling for the measurement round each resected

Contouring.-The first step in contouring is to measure or to the distance (except in the case of refraction which acts as choose the datum to which the height of all points shall be reand meaned over a long period of time at same tide gauge. With reference to this datum a control of heights is distributed over the country by spirit levelling or by vertical angles measured with the theodolite.

Geodetic levelling would not be available, normally, as a backbone or control for a topographical survey. For this latter purpose secondary levelling with errors not exceeding about 0-03 foot per mile would suffice. These secondary chains, spaced fifty to a hundred miles apart in a grid or net, are generally confined to railways or roads. The intervals would then be filled up with subsidiary orders of levels reaching eventually such errors as o I foot per mile over short lengths Levels of a topographical class are often run with the tachymeter in conjunction with plane

In topographical surveys of new countries it is usual to base contouring on a control of heights determined trigonometrically (by vertical angles with a theodolite). The operations of triangulation and determination of heights are thus combined. Truly simultaneous observation between two points will tend to eliminate refraction In all other cases there is bound to be uncertainty. Observation of vertical angles should be confined to the times of minimum refraction (early in the afternoon), and heights should be carried forward through the shortest sides-since the correction for refraction varies as the square of the distance. Trigonometrical heights show errors of the order of two or three feet in roo miles

In plane-table surveys minor heights are obtained with the Indian pattern clinometer, a small instrument which reads slopes. vertical angles, and natural tangents of the vertical angles. The chnometer (nine inches long) has two vanes. In the rear vane is a sight hole which can be levelled in relation to the zero point of the front vane. If confined to a radius of two miles this clinometer gives excellent results, but at longer ranges errors rapidly increase

The increasing use of the aneroid barometer is due to the convenience of measuring height directly instead of deducing it from distance and slope. A barometer measures the pressure of the air however and before it can be used to measure either absolute or relative heights corrections must be applied to eliminate the effect of (a) Weather, durnal, and area variations, (b) Temperature, (c) Index or other instrumental errors

The first correction is usually applied by comparing the record of a barometer retained in camp with that of the field instrument. The second can be applied directly if the shade temperature is measured at the time of each reading, but thermometer readings must also be taken for the stationary or camp instrument. Under particularly stable conditions it is possible to record the movement due to average diurnal variations and to dispense with the camp instrument, the recording of which is often difficult to arrange In these cases the record graphs should be either corrected for variation in temperature or amplified by a statement of the mean temperature at definite time intervals. There is much to be done still in designing survey barometers with an eye to reducing instrumental errors such as lag, friction of pivots, etc.

The hypsometer (or boiling point apparatus) is of more value to the explorer than the surveyor.

In topographical surveying contours are not generally followed out in detail, but are sketched in upon the control. Strict accuracy in contouring is not perhaps a very important feature of a topo-graphical map. Topographical scales will not show, in any case, enough information for engineering enterprise, whereas a relatively good and reliable picture of the accidents of the ground is of the first order of importance in the development of a new country. The sketching in of the contours is helped by measuring gradients, by noting all points in the observer's level and by spacing contours properly on rivers and streams. There is little difficulty in attaining sensible accuracy in the position of contours in hilly country, but errors of four or five feet in altitude are normal and may be appreciable in flat country.

The vertical interval between contours depends principally upon

the scale of the map although it is also conditioned by the type

ferred It is now common to accept mean sea-level, as measured of country. Thus the same vertical interval could hardly be applied to Switzerland and to Flanders. A good idea as to the proper interval in feet for average country will be obtained by dividing 50 by the scale in inches to the mile. Thus a man on the scale of 1 inch to one mile would have contours at 100 feet intervals

Field Sheets .-- As explained in the article on plane tabling the board is covered with paper, canvas backed, or mounted previously on a thin sheet of aluminum. Some form of celluloid is also used on occasion. This covering is called the Field Sheet On it are plotted the control and the boundary lines of the individual task, and on it the plane tabler subsequently maps. A plane tabler should be "within his points." The area of his work should then be substantially less than that of the board itself in order to allow of plotting control points in the margins, which are also wanted for notes and lists of names On the other hand, a plane tabler starts a new field sheet slowly and gathers pace as he gets to know his control and his country. A good mean figure for the area of work on a board of 18×24 in. is from 60 to 80 sq. inches.

The plane tabler's area should be bounded by definite, ruledin lines It sometimes happens that a river or other topographical obstacle makes it imperative for neighbouring topographers on either side to work to this natural and therefore megular line, but the accuracy of subsequent adjustment suffers. The dividing line should be one across which roads, rivers and other details pass naturally. An overlap between well trained plane tablers is neither necessary nor advisable, nor is it, necessary for them to meet at any stage of their work. The correct conventional signs and colours will have been laid down in advance and each plane tabler will ink in his work as and when he considers it final No colour which is not photographically opaque should be used. It is not generally advisable to map at scales larger than the final map The plane tabler judges more accurately the amount of generalisation necessary if his field sheet is plotted at the map scale and as names are generally written in the margin, there is ample space available in which to show all the required detail.

On conclusion of the survey, the field sheet will be available for checking. Every party should have some proportion of its strength earmarked for revision. After, or during, revision the edges common to the finished field sheets should be compared. Differences on the edges should be small, but occasional errors in orientation ("swing") may arise if there has been difficulty in seeing the control points. Differences should be traced backwards to the nearest resections and for this reason resected points and their heights should be left in pencil on the field sheet until comparisons are finished.

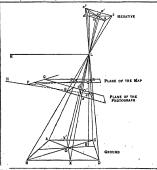

#### SURVEYING FROM AIR PHOTOGRAPHS

A photograph is a perspective view of the ground it represents. In certain cases, though rarely, the ground surface is truly parallel to the plane of the photographic plate. In this case the photograph is a correct plan. Any other relationship of ground (or map) and photographic plane results in a true perspective plan so long as the surface to be mapped is flat, the angle between the two planes being known as the tilt. In this case the map can be wholly reconstructed on perspective lines,

The general case differs from either of the above in that the surface to be mapped is rarely flat, presenting the three ordinary dimensions of nature, whilst, as in the second case, the photographic plane is inclined or tilted to the map plane. There are then two difficulties to surmount, the perspective effect and that of difference of altitude. These two effects act from different points on the plane of the photograph. It is one of the hardest problems of surveying from air photographs to disentangle these two effects and to correct them in the proper way. The photograph is a central perspective of the ground mapped, which is true in so far as lens, shutter, photographic material, temperature changes and rigidity of the camera allow. The perspective centre is the point on, or with reference to, the plate from which directions to points on the ground correspond to those from the camera. Height, however, introduces in the perspective view distortions which radiate from a point in the plane of the photograph vertically below the front notal point of the lens. This pount is commonly known as the Photo Plumb Point. The perspective centre and photo plumb point councide with each other, and with the optical centre, when the two planes (ground and photo) are parallel. In all other cases these three points are distinct from each other and lie on a line perpendicular to the axis of tilt at distances which are functions of the tilt.

As nearly all photographic surveying demands a knowledge of the position of these points the first step is so to calibrate and to adjust the camera that the optical centre corresponds to the promotap lapint (the point at which a perpendicular from the front nodel point meets the plane of the photo). Fiducial marks photographed to the four edges of the plate can then be joined up to give the correct position. It is with reference to this position that the perspective centre and photop lumb point can be jound. The principal distance (between the lens and the principal point) must also be measured. In the remainder of this article it will be assumed that the camera has been properly calibrated and adjusted

calcutated and adjusted. The Single Photograph in Perspective. (a) When the Grand is Flat—II is the representative fraction of the scale, L be a distance on the ground, and I the corresponding distance on the photograph, then for any given small area  $S = \frac{1}{L}$ . But I is conditioned by the tilt and the scale varies accordingly. Where photographs are taken as nearly as possible with a vertical axis then  $S = \frac{1}{L}$  where l is the principal distance (not quite the same thing as the focal length), and H is the height of light. Whether or not photographs are nearly vertical the problems is the same because it has not been found possible hitherto to maintain the axis truly vertical, to record such deviations from the vertical as may occur, or to keep a constant height. In

by country of col. M. M. Macleon, from trads. Oft. Socy., by perhipsion of sect. Fig.  $\phi$ 

every case then the photograph is a perspective view at an unknown till and from an unknown height. The effect of tilt can be eliminated by perspective treatment founded on the coresponding positions (on ground and photograph) of four points. Such treatment may be either graphic or photographic and is generally called rectification.

Graphic methods are seldom applied to the whole photograph. In practice it is easy to find straight lines through points clear on the photograph, and already mapped, which will intersect on, or sufficiently close to, the new point which is to be added.

Perspective figures may also be used If the lines or subdivisions of the perspective figures are sufficiently close, detail may be copied by eye, correcting both for tilt and for scale in the process

Photographic rectification is more suitable for larger aleas if these are really flat I must be remembered however that a sharp image is essential to good plotting and that the ordinary projecting lantern, though it offers freedom of movement for the screen, does not do so for the photograph. This latter movement is, however, necessary to secure a sharp image Space forbids a further analysis of the perspective and optical principles involved (See bibliography). For small scale or exploratory mapping it may be convenient to assume that photography has postic pictures made up of "vertical" photography as postic pictures made up of "vertical" photography as made up of "vertical" photography as made up of "vertical" photography are made on this assumption, although where good maps already exist, mosaics are usually buttu our postions taken from them

Examples of Surveys on the Above Lines: 1 The Topographical Survey of Canada has made excellent quarter inch maps of the lake and river areas of the Laurentian Plateau from highly tilted oblique photographs in which the horizon appears, and serves the purpose of two of the four necessary control points

ii The swamps and forests of the Irrawaddy Delta were mapped by the Survey of India from "verticals" controlled by trangulation and traverse Individual photographs were not rectified but strips of photographs were prepared and rephotographed to the correct scale as given by the control

ni. The Air Survey of Flanders and Picardy in 1916-17 was based on a fresh triangulation, on which an old but farily reliable cadastral survey was assembled. Fresh detail, inclusive of ternches and other military works, was added from vertucal air photographs, each of which was treated as a perspective view within the narrow limits of the cadastral control.

(b) In Ordinary Country and for Contoured Maps — In the bundle of rays which converge to the camera that from the top of a high chimney or hill (unless it be vertically under the camera) will make a larger angle with the vertical than will the ray from the point directly under that chimney or hill top Heights are thus displaced outwards from the plumb point, depressions inwards The only perspective effect which holds good is that of direction from the perspective centre.

In ground photo topography the position, height and tilt of the camera are known. In air photo topography none of these are known, but they can be found from the corresponding positions on ground and photograph of four points properly surveyed in plan and in height.

The reconstruction may be graphical, mathematical or mechanical. Graphical methods are not sufficiently precise, whilst a mathematical solution, possible in several ways, is excessivel lengthy. The mechanical solution is that adopted in the machines for stereoscopic measurement which will be mentioned later. All three suffer from the difficulty of securing sustable well defined and sharp images on the plate Precision of measurement on the plate is therefore difficult to attain whilst the comparatively small area of the base (the area included by the four control points), and the comparatively sharp angles at the apex, are difficulties.

Pairs of Photographs.—A pair exposed from different air stations and covering a common portion of ground gives two directions to each point in the area common to the two photographs. The positions and heights of the points can therefore be completely determined so long as the constants of exposure are known.

The stereoscopic machines for surveying from ground statons act on this general principle but the problem they solve is comparatively easy because the positions of the ground stations can be surveyed directly and the photographs can be taken at measured angles of tilt and in a definite angular relationship to each other. Air stations cannot be surveyed directly Reference must be made from the images on the plates to the points of a ground control, which those images portray, before the stereoscopic image can be plotted on the plane of the map (e.g., mean sealevel), properly oriented, and reduced or enlarged to the appropriate scale. This reference to ground control can be carried out in two ways. Firstly, as in those stereoscopic machines which

follow the general lines of their predecessors designed for ground stereo plotting, each photograph is set, singly, upon a control of four points surveyed on the ground, thus reconstructing the position and tilt of the plate in space When both plates of the pair have been thus placed a final joint setting ensures proper correspondence. The process of setting may take several hours There is however another way which is to set the pair in correspondence, in space, before referring to the ground control The pair is said

to be in correspondence when corresponding directions in space intersect, each pair of points being in correspondence when the rays to them intersect. A perfeci. correspondence between plates is secured when five points are in correspondence and the plates are then set in their correct relative positions to each other and to the base line between the two air stations This is the principal of the Fourcade stereogoniometer. The strip so set or plotted is, however, not on the required plane nor is it necessarily correct in scale and orientation. To secure correct plan the whole must be referred to a ground control which, however, may be comparatively open. We must know-

BY COURT

position of the horizontal which can afterwards be corrected. The data so obtained set the machine for

- (a) The length of the air base
- (b) The angle through which both photographs must be rotated about the air base, in order to re-establish the vertical plane containing the air base.
  - (c) The inclination of the air base to the horizontal.

However the plates of a pair have been set, detail on the relief or stereoscopic image from a pair of set photographs is plotted by the superimposition of the image formed by a pair of artificial "floating marks" which combine stereoscopically to produce that image at a known position in space. The movement of the image relative to the landscape enables the latter to be measured and surveyed in detail. For convenience however in mechanical and optical construction it is usual for the "floating mark" to be fixed and the stereoscopic image of the landscape to be moved. Maps so produced have been mainly cadastral and engineering plans at a large scale. Meanwhile for topographical work at smaller scales methods have been evolved which depend upon the elimination, by good and consistent flying, of any excessive tilt. For all classes of air survey it is most important that navigation in the aeroplane should aim at maintaining an undeviating course both as to direction and height,

Methods for securing straight flight and constant height have not yet been standardized. As a rule each pilot has evolved his own methods for himself, Great skill is often displayed but variations of wind may well cause displacements of track of half a mile in a ten-mile strip. Deviations of 80 to 100 ft. in height are common. This problem, which can only be solved by a judicious mixture of instrumental control and training, remains one of the most important to surmount. If the tilt is small the perspective centre and the photo plumb point approach each other and the principal point. It is possible then to assume that directions from the principal point may hold good both as regards tilt distortion

and height distortion Methods based on this assumption are known as radial methods. The first assumption made is that the air base of any pair is defined in direction by the line joining the photographic images of the two principal points. It would not be possible however to accept as relatively correct on the ground the successive distances measured on the photographs between principal points. It is usual in these methods to allow for an overlap large enough to include the two air bases (forwards and backwards) from the centre of each individual photograph The positions of the fore and back stations can thus be found by a comparison of detail, but such tilt and height distortion as may occur on the lines between them are sufficient to introduce serious errors of length

The scale of the plot is, therefore, obtained by accepting an arbitrary length on the first photograph and by continually fixing points in the overlaps and refixing the principal points from them thus -The base 1-2 on the first photograph is set along any line which will be convenient for subsequent plotting. A line 12 is now drawn to a (on the photograph, image of A on ground) and is accepted as an arbitrary length on the "plot" The second photograph is now set on line 2-1 and moved along

it till the direction from 2 to A cuts the position a on photograph 1. Thus the distance 1a is made the base for all subsequent work From 1 and 2 directions are drawn to b and c (1mages of B and C) which appear on both photographs. As these also appear on the third photograph which is set on the direction 2-3 (between principal points 2 and 3) the position of 3 (principal point of the 3rd photograph) can be resected.

Naturally the construction lines must be drawn on tracing paper, linen or celluloid (the latter is most convenient), the photographs being placed separately and successively under it. Once the positions of the principal points have been plotted all other points of detail may be fixed by the intersection of the photographic directions. A particular development of the radial method, commonly known as the Arundel method, employs a small "topographical" stereoscope in these first stages of plotting The particular feature is the addition over each photograph of glass plates on which are etched diamond shaped grids These grids fuze stereoscopically into a plane which may be moved vertically in relation to the landscape, for contouring, and which are also used to show when the pair is properly in correspondence By this method the orientation of the air base can be established and marked on each photograph. Contouring in the Arundel method is carried out on alternate photographs Each pair is set and examined in the topographical stereoscope on the assumption that they are untilted and exposed from the same altitude. The result-

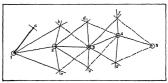

Fig 8

ing stereoscopic image is naturally subject to errors in apparent slopes, the effect of which must be held in check by a fairly close height control. The plane formed by the diamond grids may be made to touch the ground at any place, the extent of movement being recorded on scales. Other heights may then be interpolated and when a sufficient control has been secured contours can be drawn in by eye on the actual photograph. They are subsequently traced in correct position on the celluloid plot.

### MAP REPRODUCTION

The general heading of reproduction covers the various processes of drawing, photography and printing, which come between the survey on the ground and the completed map There is a stage generally carried out by draughtsmen called compilation, which, however, antedates fair drawing and is equivalent to survey. Small scale maps of the less well known parts of the world are made up from material of various sorts and generally of

The next stage is fair drawing. The draughtsman's first task is to plot the graticule and margin of his sheet on the chosen projection. He then plots the control points in proper position and begins to incorporate his material. Whether the latter is compilation, or field sheet, it is probable that the photographer will be called upon to provide bromides at the required scale The next point to decide is the number of colours to employ. If the whole map is drawn on one sheet of paper the photographer will have to divide colour from colour during his preparation of the zinc plates. If each colour is drawn separately then subsequent photography and zincography is made easier, but the fit of one colour upon another, commonly known as the register, will suffer; for, once embarked upon, the various different drawings may expand or contract unequally. The procedure chosen is often a mixture of these two principles.

Sometimes the field sheets are assembled and photographed to be printed in blue and to act as a direct key to the drawing of various colours. Blue is chosen because, in the subsequent photography of the completely drawn colour sheet or plate, blue will not appear on the negative, which will record nothing which has not been inked in. This system is handy, and guards against bad register The use of a complete key of this sort implies that the whole of the material can be collected and photographed into position at one and the same time. In other cases each main colour is drawn on its own tracing paper, the various plates being compared and examined, over each other, at frequent intervals, to prevent the clash or overprinting of the different colours In all such drawing the colours used must be photographically opaque Where main colours are treated separately each is drawn in black. Where all the colours are drawn together a difference must be made as a guide to subsequent separation but the colours employed need not be those of the final map

The main photographic process of preparing the printed record from the finished drawing is heliozincography. In this process the original drawing is photographed, and the glass negative is then laid over a sensitized zinc plate. The negative and zinc are held in close contact in a frame from which the air can be pumped. Light penetrates the lines and names left clear on the negative and hardens the surface below. The remainder of the sensitized surface, protected by the negative, remains soft and can be washed away.

In the heliozincographic process each plate is photographed to the proper dimensions. The great advantage of heliozincography lies, however, in the possibilities of touching up or adding fresh detail actually on the negative. A special staff is employed in large map establishments for this purpose. If all the colours of the final map have been drawn together it is at this stage that separation occurs. As many negatives are made as there are to be main colours. On each negative everything irrelevant to the particular colour in view is duffed out. The glass negatives then become the final records, from which any number of printing plates may be made,

The zinc plates are now given over to the printers. (See Lithog-

"SURVILLE, CLOTILDE DE," the supposed author of the Poésses de Clotslde. The generally accepted legend gave the following account of her. Marguerite Éléonore Clotilde de Vallon Challis, dame de Surville, was born in the early years of the 15th century at Vallon In 1421 she married Bérenger de Surville, who was killed at the siege of Orleans in 1428 Her husband's absence at the war inspired her heroic verses and his death her elegiac poems The last of her poems is a chant royal addressed to Charles VIII. In 1803 Charles Vanderbourg published as the Poésies de Clotilde some forty poems dealing with love and war Research showed that the documents, communicated by the marquis de Surville to Vanderbourg were not genuine, and the account of Clotilde herself was proved to be inaccurate.

## SURVIVAL: SEE PSYCHICAL RESEARCH

SUS, a province of southern Morocco. It is an east-to-west valley, 125 mi, long, bounded by the Atlantic ocean, High Atlas, Siroua and Anti-Atlas The area is about 12,620 sq.mi. Sus has a Saharan climate slightly mitigated by its nearness to the Atlantic The argana (Argana sideroxylon) is the characteristic tree, it has the appearance of a spiny olive, and forms sparse forest-steppes The waters of the Wad Sus and its affluents allow of some cultivation, helped by irrigation, but one must not exaggerate the agricultural wealth of the region; it is reputed to be rich in mines, especially of copper. The population is about 400,000, grouped at the foot of the mountains and along the Wad; it is Berber in race and speech, and belongs to the Chleuh group The Susis emigrate willingly and are excellent workmen. The port of Sus is Agadir, the Santa-Cruz of Cape Aguer of the Portuguese; situated on the Atlantic to the north of the mouth of the Wad Sus, it includes a citadel and a fishing village. Tarudant, capital of Sus, is a native town of 6,000 inhabitants, of whom 1,000 are Jews.

SUSA (Shúshan, Sús), capital of Susiana (Elam) and chief residence of Darius I and his successors. It lay under the Zagros range at about lat 32°, near the bank of the Karkha (Choaspes) river and close to the Kárún.

(For early history see ELAM)

The site, identified (1850) by W. K. Loftus, has on it four mounds One, rising about 38 metres, holds the citadel. A second to the east represents the palace of Darius I and was excavated by M. Dieulafoy. The enamelled bricks taken from its walls are in the Louvre. A third mound to the south contains the royal Elamite city, while the fourth mound consists of the poorer houses. Excavation of the citadel was begun by I. de Morgan in 1897. It yielded the obelisk of Manistusu, the stele of Naram-Sin, and the Code of Hammurabi (the latter in the winter of 1901-02). (See Babylonia and Assyria.)

The finest pottery came in the lowest strata, 25 metres below the surface, and belongs to two different civilizations both in the Neolithic period. The earlier is characterized by vases of fine red clay, wheel-made, in a few well-defined shapes, but all with very thin, polished sides. The decorations applied in black paint or redbrown ferruginous earth consist of bold geometrical patterns, often combined with spirited studies from nature. The pottery of the second period shows a retrogression, being coarser and porous

Above the early strata come remains of Elamite and early Babylonian civilization, inscribed objects from the latter bearing pictorial characters from which the cuneiform was evolved. The upper portions of the mounds disclosed inscribed Achaemenian monuments, Greek pottery and inscriptions of the 4th century B.C., coins of the kings of Elymais, and Parthian and Sassanian relics. Moslem tradition says that the tomb of the prophet Daniel

bank opposite the supposed spot. Until after the 14th century mountains and traverses the Gettysburg battlefield. the city was a flourishing centre of a district famous for silk, sugar cane and oranges. It is now deserted.

SUSARION, Greek comic poet, a native of Tripodiscus in Megaris. About 580 B.C. he transplanted the Megarian comedy into the Attıc deme of Icana, the cradle also of Greek tragedy and the oldest seat of the worship of Dionysus. According to the Parian Chronicle, there appears to have been a competition on this occasion, in which the prize was a basket of figs and an

amphora of wine.

Susarion's improvements in his native farces did not include a separate actor or a regular plot, but probably consisted in substituting metrical compositions for the old extempore effusions of the chorus. These were intended for recitation, and not committed to writing. Such performances, however, did not suit the taste of the Athenians, and nothing more was heard of them until 80 years after the time of Susarion.

U. von Wilamowitz-Mollendorff (in Hermes, ix) considers the so-called Megarian comedy to have been an invention of the Athenians themselves, intended as a satire on Megarian coarseness and vulgarity. The lines attributed to Susarion (in Meineke, Poetarum comicorum grascorum fragmenta) probably are not

SUSO [Seuse], HEINRICH (c. 1300-1366), German mystic, was born at Überlingen on Lake Constance; he assumed the name of his mother, his father being a Herr von Berg. He was educated for the Church, first at Constance, then at Cologne, where he came under the influence of the greatest of the German mystics. Meister Eckart. He subsequently entered a monastery in Constance, where he subjected himself to the severest ordeals of asceticism. In 1335 he wandered through Swabia as a preacher. and won all hearts by his gentle, persuasive eloquence; the effusive lyricism of his language made him an especial favourite among the nuns. About 1348 he seems to have settled in Ulm, where he died on Jan. 25, 1366.

Suso's first work, Das Büchlein der Wahrheit, was written in Cologne about 1329. Setting out from Eckart's doctrines, he presents the mystic faith from its speculative or theoretical side, whereas in Das Büchlein der ewigen Weisheit, written some vears later in Constance, he discusses the practical aspects of mysticism.

The latter work, which Suso also translated into Latin under the title of Horologium sapientiae, has been called the finest fruit of German mysticism.

of German mysicism.

SUSSEX, EARLS OF. The early history of the earldom of Sussex, an English title, is involved in some obscurity. owing to the fact that under the Norman kings titles of earls were often indifferently derived from a county, from its chief town or from the earl's principal residence, although the distinctive mark of an earl was deemed to be his right to "the third penny" of the pleas of a county (see EARL). Thus in the 12th century the same person is sometimes found described as earl of Sussex, sometimes as earl of Chichester and sometimes as earl of Arundel, while the inclusion of the counties of Sussex and Surrey under the jurisdiction of a single sheriff led at one time to further confusion. The difficulty was increased by the crown's admission in 1433 that the possession of the castle of Arundel carried with it the right to the title of earl of Arundel, though a later investigation proved the invalidity of the claim. G. E. Cokayne (Complete Peerage, i, 138, 139) holds that Roger de Montgomery, who received grants from William the Conqueror of a large part of the county of Sussex, including the city of Chichester and the castle and honour of Arundel, besides lands in Shropshire with the castles of Shrewsbury and Montgomery, was the first earl of Sussex. Whatever his titles were, they were forfeited to the crown when his son Robert was attainted in 1102, and the forfeited estates were conferred by Henry I on his second wife Adelicia, who after Henry's death married William de Albini, or d'Aubigny. The latter was created earl of Sussex by King Stephen, and "the third penny" of that county was confirmed to him by an instrument of the reign of Henry II, in which, however, 620 SUSSEX

he is styled earl of Arundel, a designation by which he was more generally known. His grandson William, 3rd earl of Sussex, was one of King John's sureties for the observance of Magna Carta, and in 1243, the earldom reverted to the Crown on the death of Husch de Albim, 5th earl of the line (See Arundel, Earls or)

Ratelyffe Earls.—For nearly two hundred years, from 1347 to 1330, the title of earl of Sussex did not exist in the English peerage In 1329, however, it was conferred on Robert Radchife, Radchyfie or Ratchyfie (c 1438-1542), who had been made Viscount Fitzwalter in 1325 in 1340 Ratchyffe was appointed great chamberlain of England With Edward, the 6th earl (c. 1535-1641), but tile became extinct

Savile Earls—In 1644 Thomas Savile (c 1590-c 1659), son of join Savile, its Baron Savile of Pontefract (1560-1659), was created earl of Sussex Savile opposed Wentworth, afterwards earl of Strafford, the rivalty between the Saviles and the Wentworths being of long standing in the history of Yorkshire. During the Great Rebellon he played a double game, and was imprisoned at different times by both parties His later years were spent in extrement at Howley Hall, where he died about 1650. He was succeeded in the earldom of Sussex by his son James, on whose death without issue in 1671 the title became extinct

It was revived in 1645 in favour of Thomas Lennard, 15th Baron Dacre, whose wife Am (d 1722) was a daughter of the famous duchess of Cleveland by King Charles II, and again became extinct at this nobleman's death in 1715. The title was next conferred in 1770 on Tablos Velvetron, and Viscount de Longueville and 16th Baron Grey de Ruthyn (c. 1692—1731), from whom it descended to his two sons successively, becoming one more extinct on the death of the younger of these, Henry, 3rd earl of Sussex of this creation, in 1790.

Royal Karls.—In 1807 Pfinc Augustus Frederick (1773—1843), the sust has ond George III, was created duke of Sussex. Spending his early years abroad, the prince was married in Rome in 1793 to Ludy Augusta (d. 1850) daughter of John Murray, 4th earl of Dumone. The ceremony was repeated in London and two children were born, but under the Royal Marriage Act of 1773 the Court of Arches declared the union illegal The children took the name of Grate Sussex was a man of themal ideas; he knowwed the abolition of the slave trade, the repeal of the corn laws and the removal time of the slave trade, the repeal of the corn laws and the removal the size of the corn and the size of the

SUSEX, THOMAS RADCLYFFE [or RATCLYFFS], 320 EARM of (c \$155-458), lorid-lettenant of Ireland, eldest son of Henry, and earl of Sussex (see Sussex, Earss or), by his first wife, Elizabeth, daughter of Thomas Howard, and duke of Nor-folk, was born about \$153, and after his rither's succession to the eardon in \$154 was styled Viscount Fitzwalter. After serving in the army abroad, he was employed in \$153 in negotiating a marriage between Edward VI. and a daughter of Henry II., king of France His prominence in the kingtom was shown by his unclusion among the signatories to the letters patent of June 76, \$153 on among the signatories to the Cityly Line in the prevention of the company of the c

of Edward VI to promote Protestantism in Ireland, and the "plantation" by English settlers of that part of the country then known as Offaly and Leix But Fitzwalter first of all found it necessary to make an expedition into Ulster Having defeated O'Neill and his allies the MacDonnells, the lord deputy, who by the death of his father in February 1557 became earl of Sussex, returned to Dublin, where he summoned a parliament in June of that year Sussex then took the field against Donough O'Conor, whom he failed to capture, and afterwards against Shane O'Neill, whose lands in Tyrone he ravaged, restoring to their nominal rights the earl of Tyrone and his reputed son Matthew O'Neill, baron of Dungannon (See O'NEILL) In June of the following year Sussex turned his attention to the west, where the head of the O'Biiens had ousted his nephew Conor O'Brien, earl of Thomond, from his possessions, and refused to pay allegiance to the Crown; he forced Limerick to open its gates to him, restored Thomand, and proclaimed The O'Brien a traitor. He took part in the ceremonial of Oueen Elizabeth's coronation in January 1559, and in the following July he returned to Ireland with a fresh commission, now as lord lieutenant, from the new queen, whose policy required him to come to terms if possible with the troublesome leaders of the O'Neills and the MacDonnells Sussex was recalled, at his own request, in 1564 His government of Ircland had not, however, been without fruit Sussex was the first representative of the English Crown who enforced authority to any considerable extent beyond the limits of the Pale

On his return to England, Sussex immediately threw himself into opposition to the earl of Lexester. In 1566 and the following year Elizabeth employed him in negotiations for a marriage with the archduke Charles When this project fell to the ground Sussex returned from Vienna to London in March 1568, and in July he was appointed lord president of the north, in which office he had to deal with the rebellion of the earls of Northumberland and Westmorland in 1569. In 1370 he laid waste the border, maded Scotland, and raided the country round Dumfries, reducing the rebel leaders to complete submission In July 1572 Sussex became lord chamberlain, and he was henceforth in frequent attendance on Queen Elizabeth, both in her progresses through the country and at court, until his death on June 9, 1583.

The earl of Sussex was a patron of literature and of the drama. He was twice marned, first to Elizabeth, daughter of Thomas Wrothesley, earl of Southampton; and secondly to Frances, daughter of Sir William Sidney. His second wife was the foundress of Sidney Sussex College at Cambridge, which she endowed by her will The earl left no children, and at his death his titles passed to his brother Henry

to his brother Henry

SUSSEX, a southern county of England, bounded north by Surrey, north-east by Kent, south by the English Channel, and west by Hampshire. The area is 1,457 sq miles. The county consists of the central and southern portion of the broad east to west dome of the Wealden anticline, and is very long (78 m) in proportion to its breadth (48 m. at broadest). The dominant feature is the chalk of the South Downs (average height 500 ft, Ditchling Beacon 800 ft.) which cross the county in a westnorth-west to east-south-east direction, ending in bold cliffs at Beachy Head. Westward from this point the chalk forms the south coast, except that at Seaford there are outliers of Read-ing beds and from South Lancing onwards the same beds extend as a thin belt into Hampshire, there to form the Hampshire basin. This belt lies a few miles from the coast, except south of Chichester, where it broadens out and forms the low flat headland of Selsey Bill. East from Beachy Head, Wealden clay and Hastings beds form the coast, but recent deposits round Winchelsea and Rye (members of the Cinque Ports and prominent in

62 I SUSSEX

the sea The South Downs dip gently southward, but form a steep escarpment to the north, where the upper formations of the anticline have been denuded, exposing in succession from south to north, gault and upper greensand, lower greensand, Wealden clay and Hastings beds, with small patches of Purbeck shale, and limestone with beds of gypsum lying west of Battle. The gault and upper greensand form a plam at the foot of the escarpment, bounded north by the elevated ridge of the lower greensand, beyond which the Wealden clay and Hastings beds give rise to hill country known as the Forest Ridges (800 ft near Crowborough), where rise many Sussex rivers Of these, the Rother forms part of the Kent boundary and enters the sea below Rye: the Cuckmere rises near Heathfield (where also natural gas is tound in the Lower, Wealden and Purbeck beds); the Ouse, the Adur and the Arun rise in the district of St. Leonard's forest, flow south and breach the chalk, having respectively as gap towns, Lewes, Steyning and Arundel, and as ports, Newhaven, Shoreham and Littlehampton

The country north of the Downs was formerly covered with forest, but much wood was cut for export to the Low Countries as early as the 14th century, and for the Wealden iron industry. especially in the 17th and 18th centuries. The coast line of Sussex is long and exceedingly varied, and encroachment and erosion have taken place as well as accumulation. Old Winchelsea was submerged in the 13th century, the site of the ancient cathedral of Selsey is a mile out at sea; 5,500 ac, were submerged between 1292 and 1340; early in the 14th century, Pagham harbour was formed by the sudden flooding of 2,700 ac, since reclaimed. The latest movement of the coast is probably one of slight elevation The following changes have taken place at river mouths .- Prior to a great storm on Oct. 12, 1250, the Rother entered the sea 12 m. to the east; until 1570, the outlet of the Ouse was at Seaford, the Adur has frequently shifted its mouth Submerged forests occur offshore. The sheltered coast has given rise to many watering-places --- Brighton, Hastings, Eastbourne, Bexhill, Seaford, Shoreham, Worthing, Littlehampton, Bognor.

History .- Sussex, with its long southern shore, supplying fish

Charlet 1

and salt, and dissected by mouths of clear rivers, with gravellined valleys leading to sunny chalk slopes, was admirably suited to the needs of primitive man, and we have definite traces of him in Palaeolithic times, on the coast, e.g., near Worthing, Eastbourne, Brighton and Chichester, and in the valleys, especially of the Arun and western Rother. In Neolithic times these and similar sites were very important, as kitchen middens, tools, bones of animals, etc., abundantly prove. The Downs were also used. The flint mines of Cissbury are now generally ascribed to a late Neolithic date, though some students have dated them back to earlier times The Bronze age finds (pottery, celts, etc.) show that the coastal regions (Worthing, Wilmington, Eastbourne, where gold bracelets, bronze swords, copper, etc., were found) were again used The importance of Sussex continued, and the Iron age finds, though less numerous, show a high degree of culture, the gold ornaments from Mountfield being especially important Objects of Sussex iron (hammer, plough-share, billhook, etc.) found at Mount Caburn, point to an iron industry in pre-Roman times. The Long Man of Wilmington cut in the chalk is probably also of this period That agriculture was practised by prehistoric man is also proved by the presence of numerous lynchets and rectangular fields still traceable on the chalk slopes Mr. Toms, of Brighton, has gathered evidence to show that the great earthwork at Cissbury is probably of British workmanship in the Roman period, and there are numerous other earthworks in Sussex of early Iron age or Romano-British date. Cissbury and Chanctonbury are in a "Worthing" group, while the Devil's Dyke and many others are in a Brighton group. Mount Caburn and several others are also well known.

In 447 the Saxons, under Ella and his three sons, built up the kingdom of the South Saxons. (See Sussex, Kingdom of.) They took the Roman city of Regnum (Chichester) and drove the British westward, into the forest of Andred. The Roman fortress

mediaeval tiade) and Pevensey have cut these towns off from of Anderida (Pevensey), also fell to the Saxons. According to Bede, Ella was the first Bretwalda After his time the kingdom of Sussex gradually declined and fell under the dominion of Wessex in 823 Saxon remains are found in numerous cemeteries, and scattered burial places along the south slopes of the Downs The cemetery on High Down hill, where weapons, ornaments and vessels of various kinds were found, and the Chanctonbury hoard of coins, are noteworthy A coin of Offa of Mercia, found at Beddingham, recalls the charter of Archbishop Wilfred in 825, in which Offa's connection with the monastery in that place is recorded From 895 Sussex suffered from constant raids by the Danes, till the accession of Canute, after which arose the two great forces of the house of Godwine and of the Normans Godwine was probably a native of Sussex, and by the end of the Confessor's reign a third part of the county was in the hands of his family Norman influence was strong in Sussex before the Conquest, the harbours of Hastings, Rye, Winchelsea and Steyning being in the power of the Norman abbey of Fécamp

Hastings and Pevensey were important under the Normans, being on the most direct route for Normandy William secured communication with London by placing the lands in the hands of such men as his half-brother, the count of Mortain, who held Pevensey, and his son-in-law, William de Warenne, who held Lewes With the exception of lands held by the Church and the Crown, the five rapes of Sussex were held by these and three other Norman tenants-in-chief. William de Braose, the count of Eu, and Roger, earl of Montgomery, who held respectively Bramber, Hastings and Arundel The honour of Battle was afterwards made into a rape by the Conqueror, and provides one of the arguments in favour of the theory of the Norman origin of these unique divisions of the county. The county was divided into five (afterwards six) strips, running north and south, and having each a town of military, commercial and maritime importance.

These were the rapes, and each had its sheriff, in addition to the sheriff of the whole county. Whether the origin of the rapes, as districts, is to be found in the Icelandic territorial division hreppr (rejected in the New English Dictionary), or in the Saxon rap, a rope, or is of Norman origin, as lordships they owed their existence to the Normans. The holdings—which had been scattered under the Saxons, so that one man's holding might be in more than one rape—were now determined, not by the manors in which they lay, but by the borders of the rape Another peculiarity of the division of land in Sussex is that, apparently, each hide of land had eight instead of the usual four virgates

The county boundary was long and somewhat indeterminate on the north, owing to the dense forest of Andredsweald, which was uninhabited till the 11th century Evidence of this is seen in Domesday Book by the survey of Worth and Lodsworth under Surrey, and also by the fact that as late as 1834 the present parishes of North and South Amersham in Sussex were part of Hampshire. At the time of Domesday Sussex contained 60 hundreds, since become 66. These courts were in the hands, either of the Church, or of great lords. The county court was held at Lewes and Shoreham until the Great Inquest, when it was moved to Chichester. After several changes the act of 1504 arranged for it to be held alternately at Lewes and Chichester.

The chief ecclesiastical franchises were those of the archbishoo of Canterbury, of the bishop of Chichester, of the Saxon foundathe of Bosham, and of the votive abbey of Battle, founded by the Conqueror. This abbey possessed, besides land in many other counties, the "Lowy of Battle," a district extending for 3 m, round The see of Chichester was co-extensive with the the abbey. county, and has altered little. It is one of the oldest bishoprics. having been founded by Wilfred at Selsey; the seat was removed to Chichester by William I.

Sussex was constantly the scene of invasions and rebellions, Pevensey and Arundel playing a great part in the latter under the early Norman kings In the barons' wars the county was a centre for the king's forces, Lewes being in the hands of the king's brother-in-law, John de Warenne, earl of Surrey, Pevensey and Hastings in those of his uncle, Peter of Savoy. The forces of the king and of De Montfort met at Lewes, where the famous 622 SUSSEX

battle and "Mise of Lewes" took place. Corrupt administration during the 13th and 14th centuries, constant passage of troops for the French wars and the devastating plagues of the 14th century, were the causes of such rebellions as the Peasants' Rising (1381) and Jack Cade's Rebellion (1450). During Elizabeth's reign there was constant levying of troops for Flanders and the Low Countries, and preparations for defense against Spain. The sympathies of the county were divided during the Civil War, Arundel and Chichester being held for the king, Lewes and the Cinque Ports for the parliament Chichester and Arundel were besieged by Waller, and the Roundheads gained a strong hold on the county, in spite of the loyalty of Sir Edward Ford, sheriff of Sussex A Royalist gathering in the west of the county in 1645 caused preparations for resistance at Chichester. In the same year the "Clubmen" rose and tried to force terms. During the French Revolution, Sussex produced many volunteers. At the outbreak of war with France (1793) a camp was formed at Brighton and at Eastbourne (1803) when the famous Martello towers were erected

In 1200 we have the first extant return of knights of the shire. Drastic reformation was effected by the Redistribution act of 1832, when Bramber, East Grinstead, Seaford, Steyning and Winchelsea were disfranchised after returning two members each, the first being classed among the worst of the "rotten" boroughs. Before 1832 two members each had been returned also by Arundel, Chichester, Hastings, Horsham, Lewes, Midhurst, New Shoreham (with the rape of Bramber) and Rye Arundel, Horsham, Midhurst and Rye were each deprived of a member in 1832. Chichester and Lewes in 1867, and Hastings in 1885. Arundel was disfranchised in 1868, and Chichester, Horsham, Midhurst, New Shoreham and Rye in 1885. In the 18th century the duke of Newcastle was all-powerful in the county, where the Pelham family had been settled from the time of Edward I, the earl of Chichester being the present representative of the family.

Architecture.-Sussex is rich in ancient castles. Lewes and Bramber are in ruins, but Arundel is still the seat of the dukes of Norfolk More famous than these are the massive remains (part Norman, mainly 13th century), of Pevensey, within the walls of Roman Anderida. Other ruins are those of the finely situated Hastings castle; the Norman remains at Knepp near West Grinstead; the remarkably perfect moated fortress of Bodiam (14th century); and Hurstmonceaux Castle (15th-century brick)

Monastic remains are few. The ruins of Bayham abbey near Tunbridge Wells, and of Battle abbey, may be noticed There are numerous churches of great interest and beauty, Of these may be mentioned the cathedral of Chichester, the churches of Shoreham and Rye, and the mother church of Worthing at Broadwater. Construction of pre-Norman date is seen in the churches of Bosham, Sompting and, most notably, Worth. There is very rich Norman work of various dates in the church of St. Nicholas Steyning Several perfect specimens of small Early English churches are found, as at West Tarring, and at Climping, near Littlehampton. Perhaps the most interesting church in the county is the magnificent Decorated fragment at Winchelsea; another noteworthy church of this period is at Etchingham, near the eastern border. The church of St. Denis, Midhurst, is mainly Perpendicular; the large church at Fletching contains the tomb of Gibbon the historian. At Cowfold, southeast of Horsham, is a great Carthusian monastery, founded in 1877.

Dialect.-A large number of Saxon words are retained and pronounced in the old style; thus gate becomes ge-at. The letter a is very broad in all words, as if followed by u, and in fact converts words of one syllable into words of two, as faus (face), tasist (taste), etc. Again, a before double d becomes ar, as arder and larder for adder and ladder; of is like a long i, as spile (spoil), intment (ointment); an e is substituted for a in such words as rag, flag, etc. The French refugees in the 16th and 17th centuries in-

troduced many words which are still in use

Agriculture.- The soil is fertile and 57.2% was under cultivation in 1939. Of this, however, only 134,723 ac, or 25,4%, was arable land. Sussex is still one of the best-wooded counties in

England, oaks are typical of the Weald and the beech of the lighter chalk lands. The Weald, the Downs and the salt marshes provide different types of pasture Weald farms often possess marsh pastures, and transhumance takes place between the two Many cattle are raised (153,483 in 1939), especially in East Sussex, and are sent from the Weald to fatten on the marshes in April and May. Sheep (Southdown and Kent) are important (228,329 in 1939), and lambs raised on the eastern marshes are often sent to the Weald to winter The south slopes of the Downs and the coastal plain at their feet, west of Shoreham, form an early region for lambs, with good arable on which both sheep and lambs can be fattened, the latter for early markets. Sheep-rearing has given rise to several fairs .- Findon (July 12 and Sept. 14); Battle (Sept. 6); Mayfield (May 30 and Nov 13); and Lewes, the most important fair of the year (Sept 25), Large sales are also held, notably at Chichester, in August Dairving is important Shorthorns and Jerseys (for butter) are the chief breeds Fruit and hops are important crops on the heavy lands of East Sussex, root-crops (including sugar beet, the output of which had inreased to 2,775 ac in 1939) and grain (wheat and oats) are grown in both, but especially in West Sussex Milk, poultry, early fruit and flowers are increasingly supplied to London and other markets. The National Trust owned 2,963 ac in Sussex in 1942.

Industries.—The industries are mostly limited to minor ones connected with agriculture (brewing, tanning, etc.), though cement is made to some extent. They were formerly very varied. The furnaces for the Wealden iron industry, which dates back probably to pre-Roman times, were chiefly in Sussex. Clay gave rise to pottery and brick-making Glass-making (with fine Hastings sand) flourished at Chiddingfold (Surrey), and at Westborough Green, Loxwood and Petworth in Sussex, Weaving and fulling were also carried on, Chichester being noted for its cloth The shores abound in shellfish, and both fresh-water and sea fishing are very important; the herring-fisheries and the salt-pans on the

coast are noted in Domesday,

Communications.-The Southern railway runs from London to Hastings, St. Leonards, Bexhill, Eastbourne, to Lewes and Newhaven, to Brighton, to Shoreham, and to Arundel, Chichester and Selsey, with numerous branches and a line along the coast. There are no good harbours, and none of the ports is of first importance, From Newhaven, however, a large trade is ordinarily carried on with France, and daily passenger steamers ply to Dieppe.

Population and Administration.—The earliest statement

as to the population is made by Bede, who describes the county as containing in the year 681 land of 7,000 families; allowing ten to a family (not an unreasonable estimate at that date), the total population would be 70,000. In 1693 the county is stated to have contained 21,537 houses. If seven were allowed to a house at that date, the total population would be 150,759. It is curious, therefore, to observe that in 1801 the population was only 150. 311. The decline of the Sussex iron works probably accounts for the small increase of population during several centuries, although after the massacre of St. Bartholomew upwards of 1,500 Huguenots landed at Rye, and in 1685, after the revocation of the Edict of Nantes, other refugees arrived.

An act of Henry VII (1504) directed that for convenience the county court should be held at Lewes as well as at Chichester, and this apparently gave rise to the division of Sussex into east and west parts, each of which is an administrative county East Sussex has an area of 780.7 sq.mi, and West Sussex 628 sq.mi, with populations estimated in 1938 at 566,680 and 264,900 respectively. Between Sept. 1939 and Feb. 1941 wartime population movements caused a decrease in the population of East Sussex of 12%, this area being close to the path of invading aircraft, but that of West Sussex increased by 5%. East Sussex includes the county boroughs of Brighton, Hastings and Eastbourne, the first two being also parliamentary boroughs, and the municipal boroughs of Bexhill, Hove, Lewes and Rye. In West Sussex the municipal boroughs are Arundel, Chichester (a city), and Worthing The geographical county is almost entirely in the diocese of Chichester. The total number of civil parishes is 271. Sussex is

divided into the following parliamentary divisions. Eastbourne, East Grinstead, Lewes, Rye, Chichester, and Horsham and Worthing, each returning one member. Brighton returns two members, and Hastings, one member.

and Hastungs, one member.

SUSSEX, KINGDOM OF (Sid Seare, ie, the South Saxons), one of the kingdoms of Anglo-Saxon Britan, the boundaries of which choincide in general with those of the modern county of Sussex. According to the tradition given in the Anglo-Saxon Chronicle, it was in 47 that a certain Ella (Aelle) eld the invaders ashore at a place called Cymenes ora and defeated the inhabitants. A further battle at a place called Mearcredesburne is recorded for 485, and in the annal for 49 twee read that Ella and Class has son sacked Anderda (Pevensey) and slew the inhabitants Ella is the first king of the invading race whom Bede describes as exercising supremacy over the southern English

The history of Sussex now becomes a blank until 607 when Ceolwulf of Wessex is found fighting against the South Saxons In 681 Wilfrid of York, on his expulsion from Northumbria by Eggfrith, retired into Sussex, where he remained until 686 converting its pagan inhabitants. According to Bede, Aethelwald, king of Sussex, had been previously baptized in Mercia at the suggestion of Wulfhere, who presented him with the Isle of Wight and the district about the river Meon in Hampshire After Wilfrid's exertions in relieving a famine which occurred in Sussex the king granted to him eighty-seven hides in and near the peninsula of Selsey which, with a lapse until 709 after Wilfrid's retirement, remained the seat of the South Saxon bishopric until the Norman Conquest. Shortly afterwards, however, Aethelwald was slain and his kingdom ravaged by the exiled West Saxon prince Ceadwalla. The latter was eventually expelled by two princes Berhthun and Andhun, who assumed the government of the kingdom. In 686 the South Saxons attacked Hlothhere, king of Kent, in support of his nephew Eadric, but soon afterwards Berhthun was killed and the kingdom subjugated for a time by Ceadwalla, who had now become king of Wessex.

Of the later South Saxon kings we have little knowledge. In 602 a grant is made by a king called Nothelm to his sister, which is witnessed by two other kings called Nunna and "Uuattus" Nunna is probably to be identified with Nun, described in the Chronicle as the kinsman of Ine of Wessex who fought with him against Gerent, king of the West Welsh, in 710. According to Bede, Sussex was subject to Ine for many years. A grant, dated by Birch about 725, is made by Nunna to Eadberht, bishop of Selsey, and to this too "Uuattus" appears as a witness In 722 we find Ine of Wessex at war with the South Saxons, apparently because they were supporting a certain Aldbryht, probably an exile from Wessex. An undated grant is made by Nunna about this time, which is witnessed by a King Aethelberht. After this we hear nothing more until shortly before 765, when a grant of land is made by a king named Aldwulf with two other kings, Aelfwald and Oslac, as witnesses. In 765 and 770 grants are made by a King Osmund, the latter of which is witnessed by Offa of Mercia. Offa also appears as witness to two charters of an Aethelberht, king of the South Saxons, and in 772 he grants land himself in Sussex, with Oswald, dux of the South Saxons, as a witness. It is probable that about this time Offa definitely annexed the kingdom of Sussex, as several persons, Osmund, Aelfwald and Oslac, who had previously used the royal title, now sign with that of dux. In 825 the South Saxons submitted to Ecgberht, and from this time they remained subject to the West Saxon dynasty.

AUTHORITIES.—Anglo-Sazon Chronicle, pp. 449, 477, 485, 491, 607, 722, 725, 823, 827 (ed. Earle and Plummer, Oxford, 1899); Bede, Historia Ecclesiastica, i. r., ii. s. iv. 13, 15, 16, 26, v. 18, 10, 32, 6d. C. Plummer, Oxford, 1896); W. de G. Birch, Cartularium

Saxonicum, Nos 78, 144, 145, 197, 198, 206, 208, 211, 212, 1334 (1885-93). (F. G. M. B)

SUSU, a tall people of French Guinea and Sierra Leone, with pleasant countenances, oval in shape, who tattoo three lines on the breast and beneath the eye. They live in confederate villages under a paramount chief, the houses of one family grouped together. Their material culture is fairly advanced. Marriage is usual between cross counts and between the husband's brother and widow Polysamy, with headship of the first wife, is common. Inheritance is patrinined. The Susu have politicor-elapious confraternities, known as Simo, including as a rule three degrees for men. Their religion is animate but influenced by Islam Susu is also the name of the fresh-water dolphin of the Ganges; it is blind, fish-eating and pale in colour (Gee CEALCA).

See Arcin, La Guinée Française (1907); N. W. Thomas, Report on the Timne-speaking Peoples (1016).

SUTHERLAND, EARLS AND DUKES OF. The first card of Sutherland was a certain William (d. 1742), whose father, Hugh Freskin (d 1204), acquired the district of Sutherland about 1179. Probably about 1230 William was created earl of Sutherland. His descendant William, the 4th earl (d 1370), was a person of some importance in the history of Sootland; he married Margaret (d. 1378), daughter of King Robert Bruce. His descendant John, the 9th earl, died unmarried in 1514.

John's sister Elizabeth (d. 1535) married Adam Gordon (d. 1537), a younger son of George Gordon, and earl of Huntly, and a grandson of King James I, and before 1516 Gordon became earl of Sutherland by right of his wife. He was succeeded by his grandson John (c, 1526-1567), the 2nd earl of his line, who was poisoned at the instigation of George Sinclair, 4th earl of Carthness. His great-grandson John, the 5th earl (1609-1663), was a strong Covenanter, being called by his associates "the good Earl John"; he fought against Montrose at Auldearn, but afterwards he rendered good service to Charles II. John Gordon (c 1660-1733), who became the seventh earl in 1703, supported the revolution of 1688 and was a commissioner for the union of England and Scotland. He was a Scottish representative peer in four parliaments, president of the board of trade and manufactures. and lord-lieutenant of the eight northern counties of Scotland. He was active in putting down the rising of 1715 This earl, who took the name of Sutherland instead of that of Gordon, was succeeded by his grandson William (c. 1708-1750), a representative peer, who helped to suppress the rebellion of 1745 William, the next earl, died without male issue in 1766, his daughter Elizabeth (1765-1839) claiming the peerage. Her title thereto was confirmed by the House of Lords in 1771.

Established in the possession of the title and estates of the earldom, the countess of Sutherland was married in 1785 to George Granville Leveson-Gower (1758-1833), who succeeded his father as 2nd marquess of Stafford in 1803. In addition to the estates of the marquessate of Stafford, Leveson-Gower inherited the Bridgewater Canal and estates from his maternal uncle. Francis Egerton, 2nd duke of Bridgewater, and these properties, together with his wife's estates, which included almost the whole of the county of Sutherland, made him a "leviathan of wealth," as he is called by Charles Greville. In 1833 he was created duke of Sutherland. Leveson-Gower was a member of parliament from 1778 to 1784, and again from 1787 to 1798 and was British ambassador in Paris from 1790 to 1792. From 1799 to 1810 he was joint postmaster-general. He was a collector of paintings, and purchased Stafford House, London He was responsible for the construction of about 450 m. of road and of many bridges, but his policy of removing a large number of his tenants from the interior to the coast aroused bitterness and criticism. However, he reduced rents and brought thousands of acres into cultivation. He died at Dunrobin Castle on July 5, 1813

See Sir Robert Gordon and George Gordon, Genealogical History of the Earldom of Sutherland (Edinburgh, 1813); and also the articles Staffore; and Buckmunham, Earls, Marquessess and Dukes or.

SUTHERLANDSHIRE, county, northern Scotland, bounded north and west by the Atlantic, east by Cathness, southeast by the North Sea and south by the shire of Ross and Cro-

marty Land area, 1,297,914 ac or 2,028 sqmi The western and bridges Attempts were made to repeople some of the glens and northern shores are indented with beautiful bays and sealochs, and terminate at many points in precipices and rugged headlands Almost the whole county is mountainous, the summits are often of finer outline than those of the Grampian heights to the south, and the surface generally consists of wild desolate moorland The highest point is Ben More in Assynt (3,273 ft )

An irregular line from Loch Eriboll on the north coast to the neighbourhood of Cromalt near the southern boundary separates the two rock groups that form the foundation of the major portion of the county. On the western side of this line are ancient gneisses and schists (the Lewisian gneiss), these are penetrated by innumerable basic and acid dikes which generally have a northwest to southeast trend. On the eastern side of the line, occupying the whole of the remaining area except the eastern fringe of the county, is a younger series of metamorphic rocks, the Moine schists. In the northwest Torridonian breccias and sandstones rest unconformably on this gness, and Cambrian rocks upon the Torridonian, the white Cambrian quartzite capping the dark Torridonian rocks on some of the hills forms a striking scenic feature. Granite masses appear in the eastern schists, and patches of Old Red Sandstone form high land near the southeast coast. Evidence of glacial action is widespread

The chief river is the Oykell, which, rising in Coniveall (3,234), a peak of Ben More, flows south and then southeast for 33 mi, to Dornoch firth. Other rivers flowing to Dornoch firth are the Helmsdale (22 mi.), the Brora (28 mi.), preserving in its name (bridge river) the fact that its bridge was once the only important one in the county; and the Fleet (17 mi), the estuary of which was embanked for 1,000 yd. in 1813 by Thomas Telford, whereby rich alluvial land was reclaimed. The Halladale (22 mi), rising in Knockfin on the borders of Caithness enters the sea to the east of Portskerry The district of Assynt is honeycombed with lakes and tarns, but the only large lake is Loch Assynt, 63 mi long, 215 ft, above the sea. The ratio of the area of islands to the total area of the lake is greater than in any other British lake. There are many waterfalls, those of Escuallin, near the head of Glencoul.

are among the finest in Great Britain.

History and Antiquities .- Of the prehistoric inhabitants, there are considerable remains in the form of many brocks (or round towers), Picts' houses, tumuli, carms and hut circles. Dun Dornadilla, in the parish of Durness, 4 mi. south of Loch Hope, is a tower, 150 ft. in circumference, still in good preservation The Noise jarl Thorfinn overran the country in 1034 and the Scandinavian colonists called it, in relation to their settlements in the Orkneys and Shetlands, Sudrland, the "southern land," or Sutherland. After the conquest of the district by the Scottish kings, Sutherland was conferred on Hugh Freskin (a descendant of Freskin of Moravia or Moray), whose son William was created earl of Sutherland in 1228 by Alexander II. On the south shore of Helmsdale creek stand the ruins of the castle in which the 11th earl of Sutherland and his wife were poisoned by his uncle's widow in 1567, with a view to securing the title for her only child, who was next of kin to the earl and his son, Ardvreck castle, now in ruins, at the east end of Loch Assynt, was the prison of the marquis of Montrose after his defeat at Invercarron (1650), whence he was delivered up by Neil Macleod of Assynt for execution at Edinburgh. In the graveyard of the old church of Durness is a monument to Robert Mackay, called Rob Donn (the brown), the Gaelic poet (1714-1778).

Agriculture and Industry.-Only about 12% of the total area was arable land in 1938, the shire ranking lowest in Scotland in this respect. The great mass of the surface is grazing ground and deer forest. The best land adjoins Dornoch firth, where farming is in an advanced condition, but there are fertile patches along the river valleys. At the beginning of the 10th century the first duke of Sutherland (then marquess of Stafford) adopted a policy of wholesale clearance of the crowded crofters of the interior to the coast. The duke incurred great obloquy, but persisted in his policy, which included reduction of rent, reclamation of land, and abolition of the tacksman or middleman He also did much to open up the shire generally by the construction of roads

(Strathnaver, for example) depopulated by the clearances. Crofters still largely predominate, over half the 2,339 holdings in 1938 being 5 ac. or under The average size, 13 ac, is the smallest in Scotland, excepting the Shetland Islands Oats, turnips and swedes, and potatoes are grown The raising of sheep (218,454 in 1938), mostly Cheviot, is the staple business of the county, and cattle are also kept Horses-principally ponies, though Clydes-dales are used on the bigger farms-are kept almost wholly for agricultural purposes. Deer forests belonging to the duke of Sutherland cover a large area

Next to agriculture, the deep-sea fisheries and the salmon fisheries in the rivers are the most important interest. Helmsdale and Golspie are fishing villages. Herrings are the principal catch, but cod, ling and other fishes are also taken. Whisky is distilled at Brora; some woollens are manufactured at Brora and Rogart; coal is mined at Brora, and limestone and sandstone quarried The exceptional facilities offered by the deer forests, moors and the many lochs and rivers attract large numbers of sportsmen, and Dornoch and Lochinver are in repute as holiday resorts The L,MS, railway enters the county at Invershin, goes northward to Lairg, then east to Brora and northeast to Helmsdale, whence it runs northwest to Kildonan, and north to Forsmard, where it shortly afterwards leaves the shire The Glasgow steamers call at Lochinver about every ten days.

Population and Administration.—The population was estimated in 1938 at 15,293 In 1931 Gaelic and English were spoken by 6,770 persons, of whom 24 spoke Gaelic only. The county is the least densely populated in Scotland Several islands lie off the west and north coast, but only Roan (61) and Chorrie (1) are inhabited Dornoch (est. 1938 pop, 676) is the only royal burgh and small burgh. There are six county districts. The shire returns one member to parliament with Caithness, and forms a joint sheriffdom with Ross and Cromarty, with a sheriff-substitute resident at Dornoch The county is under school-board jurisdiction

SUTLEJ, river, India, one of the "Five Rivers" of the Punjab It rises E.S.E. of the Manasarowar lakes in Tibet, at an elevation of about 15,200 ft., threads its way through the gorges of the Himalayas with heights of 20,000 ft. on either side, crosses Bashahr and the Sımla hill states, and enters the British district of Hoshiarpur, Thence it flows through the plains of the Punjab, receives the Beas in Kapurthala state, and joins the Chenab near Madwala From that point the whole river bears the name of Panjnad ("five rivers") until it falls into the Indus near Mithankot after a course of 900 mi.

The Sutlei supplies the Sirhind canal, which draws off its waters at Rupar, 100 mi. above the junction with the Beas; and the Upper and Lower Sutlej systems, which come below the junction. These irrigate altogether some 1,600,000 ac. Extensions include 3 new weirs on the Sutlej and 1 on the Chenab, irrigating over 5,000,000 ac.

SUTRI (anc. Sutrium), an episcopal town of Italy, 4 mi. from the railway station of Capranica, which is 36 mi. from Rome, 955 ft. above sea level Pop. (1936), 2,556 (town), 2,918 (commune). The town is on a hill surrounded by ravines, a narrow neck connecting it with the surrounding country. There are some remains of ancient city walls. The crypt of the cathedral, with twenty columns, is Romanesque, and the campanile dates from 1207. In the cliffs to the south is the rock-cut church of the Madonna del Parto. formerly a Mithraeum; and close by is a rock-hewn amphitheatre, with axes of 55 and 44 yd., now most picturesque Sutri, commanding the Via Cassia, is spoken of by Livy as one of the keys of Etruria, Nepet being the other. It came into the hands of Rome after the fall of Veii. Its importance explains, according to Festus, the proverb Sutrium ire, of one who goes on important business, as it occurs in Plautus.

SUTTEE, the Indian practice of concremation of a widow on the pyre of her deceased husband (Sanskr. sati, "true" wife). Whether the usage existed in Vedic India has been hotly debated World-wide primitive usage compelled a widow to be the wife of her husband's brother or near kinsman or, if he had been of princely standing, to be immolated with his concubines, slaves steeds, stc., at his tomb, to maintain his dignity in the next world. This usage eventually found priestly support in the Handu conception of materimony as a bond eternally renewed when the married pair were reborn in succeeding irves—a concept, hard to reconcile with polygony. In late Hindu myth Sati was Sava's, spouse who, resenting a slight but upon her lord by her father, destroyed herself but was reincarnated as Una, the beautious wife of Swa Here Sati's act is promptled by a very different mortuse, and the tale supports the view that the text of the Rig-Veda was tampered with, to support the Brahmancal light.

According to Diodorus Siculus, Strabo and St. Jerome, Suttee existed in the 4th century so In mediaeval India the practice flourished among the Rapuls—and where Briahman influences were strong. The Sait too began to be worshiped as a Maha Sait or "great and true" wife, commentated by a stone. Yet reformers denounced the usage, as in Malabar. Even the Brahmani-all jurist sometimes deprecated soft, allowing the widow the option of living an ascetic life, with rights of inheritance. The Jans do not practice saif Buddhism probably discouraged it Sichism expressly forbade it, yet on Ranjit Singh's death in 1839, several of his widows were burnt. Outside British juristiction, saif continued in families of high rank until late in the 19th century. In British territory, it was not till 1820 that Lord Wilham Bentinck, with some support from Indian opinion (see Baarma Sanda) was able, despite strong protests, to make it a statutory offence

BIBLIOGRAPHY.—H. Yule and A C Burnell, Hobson-Jobson (ed W. Crooke, 1903) gives full extracts from ancient and modern writers on the practice; J Jolly, Recht und Sitte (Strassburg, 1917)

SUTTER. JOHN AUGUSTUS (1803-1880), American pioneer, was born of Swiss parents at Kandern in the Grand Duchy of Baden on Feb 15, 1803. He came to America in 1834 and purchased land in Missours, but in 1838 went overland to California by way of the Oregon trail Here he was given a grant of 49,000 ac of land on the Sacramento river by the Mexican governor on condition that he would fortify and develop it into a strong Mexican outpost. Sutter became a citizen of Mexico and was appointed "Commissioner of Justice and Representative of the Government on the Frontier of the Rio del Sacramento" He built not only a strong fort and other buildings but a mill. tannery, distillery, blanket factory, blacksmith and other shops, for which he hired skilled workers. He imported Hawaiians and hired Indians to cultivate the land. He traded with the Indians for furs and purchased a schooner and other boats which plied on the Sacramento More land was acquired and he rapidly became wealthy. His settlement, "New Helvetia," became a rendezvous for adventurers, sailors, trappers and hunters and for an increasing number of Americans. His growing strength and independence and, above all, his hospitality to the Americans, made him the object of increasing hostility on the part of the Mexican authorities. In 1846 when the Bear Flag revolt took place and Frémont (q.v.) arrived with American troops, Sutter at first maintained an appearance of fidelity to the Mexican Government However, he made but little objection when Frémont took control of his fort and made use of his property. After California was acquired by the United States and settlement became more rapid Sutter felt the need of a new mill. It was while digging the mill race that the famous discovery of gold in California (1848) was made. Sutter tried to keep the strike a secret, but in vain, and his property was soon overrun by gold seekers from whom he could not protect himself What was worse, the U.S. Supreme Court found the title to 98,000 ac of his land invalid. Much of what was left him was used to reimburse those to whom he had granted subtitles which he was forced to make good. Soon he was bankrupt. From 1871 to the year of his death he petitioned Congress annually for some reimbursement for his services. He died at Washington, D.C., on June 18, 1880, the evening after Congress

had again adjourned without recognition of his claims

SUTTNER, BERTHA, BARONESS von (1843-1914), Austrian writer, was born at Prague on July 9, 1843, the daughter of and wool hosiery.

Count Franz Kınsky, Austrian field marshal. Through her mother she was related to the German poet, Theodor Korner She gunte intended in the German poet, Theodor Korner She gunte in the Francis in the State of the Caucaus After 1845 (360–1902), and for marshall the marshall the Caucaus After 1845 she readed Schloss Harman and in Lower Austria. A fertile write, her most famous tales and tracts denounce war, for instance, Due Weglen mider (1889), Krieg und Frieden (1866), Das Maximten Zestater, Zukuntis-Vorleuungen über unsere Zest (1899) and Der Hanger Friedenkonferens (1900) She founded the Austrian Society of Peace-lowers in 1891, and edited the monthly organ of the peace-movement, Die Weglen Neder, established in Dreseden in 1892 In 1905 she was awarded a Nobel prize of £5,000 for her peace prospanda. She died at Vienan of June 21, 1914.

Her Memoiren were published at Stuttgart in 1908. See also H. v. der Mandere, Bertha Suttner (1909)

SUTTON, SIR RICHARD (d. c. 1524), the founder, with William Smyth, bashop of Lincoln, of Braseness college, Oxford, and the first lay founder of any college, was a barrister by profession, and in 1497 became a member of the privy council In 1513 he became a testend of the monastery of Sion, a house of Brigittine nuns at Isleworth. In 1508 Sutton obtained a 92 year lease of Brasenose Hall and Little University Hall for 15 per annum, and from that time until the end of his life was occupied in purchasing estates with which he might endow the new college.

in putchasing estates with which he might endow the new Contege SUTTON, THOMAS (c. 1532—1611), founder of Charterhouse school and hospital, obtained great wealth by the ownership of coal mines in Durham and also by his marriage in 1587 with Elizabeth and the coal of the

SUTTON AND CHEAM, a municipal borough in the Epsom parliamentary division of Surrey, England, 1r mi. S. of London by the Southern railway Pop. (est. 1938) 75,586 Area, 6.8 sq mi. It adjoins the Banstead downs. The manor of Sutton, according to Domesday, belonged to the abboy of Chertsey and continued so until the dissolution of the monasteries by Henry VIII The antition iestablishment of the London county council is there. The town owes its growth to its suitability as a residential area for workers in London, It was morporated in 1931.

SUTTON-IN-ASHFIELD, market town and urban district in Nothinghamshire, England, on the border of Sherwood Forest, on the L.M.S.R. and L.M.E.R., 13 mi. N. of Nothingham. Pop. (est. 1938) 38,510. Area, 16.4 sq.mi. The 13th-century church of St. Mary Magdalene was restored in 1868. There are several colleires in the district and manufactures of cotton, thread, silk and wool hosiery.

SUYÓROV, ALEXANDER VASILIEVICH, COUNT SUVÓROV into the forests. Its trade includes timber and grain. Suwalki RIMNIKSEY, PRINCE ITALYSKY (1729-1800), Russian field mar- was taken by the U.S.S.R. in 1939 and by Germany in 1941. shal, was born at Moscow on Nov. 24, 1729, the descendant of a Swede named Suvor who emigrated to Russia in 1622. He entered the army as a boy, served against the Swedes in Finland and against the Prussians during the Seven Years' War. After repeatedly distinguishing himself in battle he was made a colonel in 1762. He next served in Poland, dispersed the Polish forces under Pulawski, stormed Cracow (1768) and was made a majorgeneral

In his first campaigns against the Turks in 1773-74, and particularly in the battle of Kosludscki in the latter year, he laid

the foundations of his reputation.

From 1787 to 1791 he was again fighting the Turks and won many victories; he was wounded at Kinburn (1787), took part in the siege of Ochakov, and in 1788 won two great victories at Focsani and on the Rimnik. For the latter victory, in which an Austrian corps under Prince Josias of Saxe-Coburg participated, Catherine II made him a count with the name Rimniksky in addition to his own name, and the emperor Joseph II created him a count of the Holy Roman Empire.

On Dec. 22, 1790, Suvórov stormed Ismail in Bessarabia, and the sack and the massacre that followed the capture equals in horror such events as the "Spanish Fury" and the fall of Magde-burg. He was next placed at the head of the army which subdued the Poles, and repeated the triumph, and some of the cruelties, of Ismail at Warsaw. He was now made a field marshal, and was retained in Poland till 1795, when he returned to St. Petersburg. His sovereign and friend Catherine II died in 1706, and her

successor Paul dismissed the veteran in disgrace. But in February 1700 he was summoned by the tsar to take the field again, this

time against the French Revolutionary armies in Italy.

The campaign (see French Revolutionary Wars) opened with a series of victories (Cassano, Trebbia, Novi) which reduced the French government to desperate straits and drove every French soldier from Italy, save for the handful under Moreau, which maintained a foothold in the Maritime Alps and around Genoa, Suvórov himself was made a prince. But the later events of the eventful year went uniformly against the allies. Suvórov's lieutenant Korsákov was defeated by Masséna at Zúrich, and the old field marshal, seeking to make his way over the Swiss passes to the Upper Rhine, had to retreat to the Vorarlberg, where the army, much shattered and almost destitute of horses and artillery, went into winter quarters.

Early in 1800 Suvorov returned to St. Petersburg in disgrace. Paul refused to give him an audience, and, worn out and ill, he died a few days afterwards, on May 18, 1800. But within a year of his death the tsar Alexander I erected a statue to his memory

in the Field of Mars, St. Petersburg,

Suvórov spared his own soldiers as little as he showed mercy to the population of a fallen city. He was a man of great simplicity of manners, and while on a campaign lived as a private soldier. But he had himself passed through all the gradations of military service. His gibes procured him many enemies. He had all the contempt of a man of ability and action for ignorant favourites and ornamental carpet-knights. Dragomirov (q,v.) avowed that his teaching was based on Suvórov's practice. Byron has given Suvórov a place in English literature in certain cantos of Don Juan.

SUWARRO or SAGUARO (Cereus giganteus or Carnegiea gigantea), a remarkable tree cactus, 15 to 70 ft. high, called also giant cactus and monument cactus, native to arid districts in southern Arizona, southeastern California and Sonora, Mexico It has a stout, woody, vertically ribbed stem, I to 2 ft. in diameter, sometimes rising unbranched, like a green, fluted column, whence the name monument cactus; more frequently it bears a few large, stout, widely diverging candelabra-like branches, but occasionally it bears numerous branches which rise vertically from near the base like a group of organ pipes. Close to the top of the stem or branches it bears white flowers which are followed by crimson edible fruits. In Arizona, of which it is the floral emblem or state flower, a desert tract containing numerous fine living specimens of the tree was set apart and is now known as Saguaro National Monument. (See Cacrus)

SUYÜTİ [Abū-1 Fadhl'Abd ur-Rahmān ibn Abī Bakr Jalāl ud-Dīn us-Suyūtī] (1445-1505), Arabian encyclopaedic writer, was the son of a Turkish slave woman. His father had been cadi in Suyūt (Upper Egypt) and professor in Cairo The boy's training was taken in hand by a Sufi friend of the father He was precocious, and in 1462 was already a teacher; in 1464 he made the pilgrimage to Mecca, and in 1486 was promoted to a chair in the mosque of Bibars. From 1501 he worked in seclusion at Rauda, an island of the Nile, and there died in 1505. He was one of the

most prolific writers of the East,

A list of his works is given in C. Brockelmann's Gesch. der Arab-ischen Luteratur, in. 144-158 (Berlin, 1902). They deal with almost every branch of Moslem science and literature. Among the best known every branch of Moslem scenec and literature. Among the best known are the High fr Vilins ut-Qurini (on the excepte scenecs of the Koran), published with an analysis by A Sprenger (Calcutta, 1852–1862), published that the Politis ut-Islandia, begun by Jalili ut-Iii ut-Mahalili (1858–1864), and finshed by Suyūti, published offen in the East; and the history of the onliphs, published at Calcutta (1858) and desewhere.

SUZERAINTY. "Suzerain," a term of feudal law, is now used to describe persons or States in positions of superiority to others. Suzerain has been defined as "Qui possède un fief dont d'autres fiefs relèvent" (Littré and Dictionnaire de l'académie française). The term was rare in feudal times in England. But it was used in France to describe a feudal lord, the supreme suzerain being the king.

In modern times the term has come to be used as descriptive of relations, ill-defined and vague, which exist between powerful and dependent States; its very indefiniteness being its recommendation. According to feudal law the vassal owed certain duties to the lord; he promised fidelity and service; and the lord was bound to perform reciprocal duties, not very clearly defined, to the vassal Dominus vassallo conjux et amicus dicitur. The relation between a lord and his vassals, implied in the oath of fealty, has been extended to States of unequal power; it has been found convenient to designate certain States as vassal States, and their superiors as suzerains. Originally and properly applicable to a status recognized by feudalism, the term vassal State has been used to describe the subordinate position of certain States once parts of the Ottoman empire. Such were Egypt and Bulgaria.

M. Gairal (Le Protectorat international) distinguishes suzerainty from protectorate in these respects: (a) suzerainty proceeds from a concession on the part of the suzerain (p 112); (b) the vassal State is bound to perform specific services; and (c) the vassal State has larger powers of action than those belonging to a protected State: (d) there is reciprocity of obligation. According to M. F. Despagnet the term suzerain is applicable to a case in which a State concedes a fief, in virtue of its sovereignty (Essas sur le protectorat international, p. 46), reserving to itself certain

rights as the author of this concession.

W. E. Hall thus defines vassal States: "States under the suzerainty of others are portions of the latter which during a process of gradual disruption or by the grace of the sovereign have acquired certain of the powers of an independent community, such as that of making commercial conventions, or of conferwars between the two. Polish colonists from Masovia penetrated ring their exequatur on foreign consuls. Their position differs from that of the foregoing varieties of States (protectorates, etc.), in that a presumption exists against the possession by them of any given international capacity" (International Law, 4th ed., p. 31).

On the whole, usage seems to favour this distinction: while a protectorate flows from, or is a reduction of, the sovereignty of the protected State, suzeramty is conceived as derived from, and a reduction of, the sovereignty of the dominant State.

As to the power of making treaties, a vassal State cannot, as a rule, conclude them; such power does not exist unless it is specially given. On the other hand, a protected State, unless the contrary is stipulated, retains the power of concluding treaties.

Definitions of suzerainty are of little use. Each instrument in which the word is used must be studied in order to ascertain its significance. Even in feudal times suzerainty might be merely nominal, an instance in point being the suzerainty or over-lordship of the papacy over Naples In some cases it may be said that suzerainty brings no practical advantages and implies no serious obligations. Among the instances in which the term is actually used in treaties are these, the General Treaty, Peace of Paris, 1856 (arts. 21 and 22), recognized the suzerainty of Turkey over the Danubian principalities Moldavia and Wallachia, modifying the "sovereignty" of Turkey recognized by the Treaty of Adrianople The convention of Aug 19, 1858 (Hertslet x 1052) or-ganized the then principalities "under the suzerainty of the sultan" The internal government was to be exercised by a hospodar, who received his investiture from the sultan, the sign of vassalship The autonomy of these vassal States was fully recognized by the Treaty of Berlin of 1878. In the Interpretation Act 1889, s. 18 (5), "suzerainty" is used to describe the authority of the sovereign over native princes.

The word suzerain is used in the Pretoria convention of 1881 between the British Government and the late South African republic. The convention (by its preamble) granted to the inhabitants complete self-government, "subject to the suzeramty of her Majesty," and this suzerainty was reaffirmed in the articles. Even when the convention was being negotiated doubts arose as to its meaning, and legal authorities were divided as to its effect. It was doubtful whether territory could be ceded by the Crown of its own authority; and if the power existed the cession could, it was said, be made only by virtue of clear words. From the articles substituted in the London convention of 1884 for those of 1881, the word "suzerainty" was omitted. Fresh doubts arose as to the effect of this omission; before the outbreak of hostilities in South Africa, the British Government maintained that the preamble of 1881, by which alone any self-government was granted, was still in force, and therefore that the suzerainty-whatever it involved-remained, the Transvaal Government, on the other hand, contended that the suzeramty had been abolished by the substitution of the 1884 convention for that of 1881. SVANE [or Sountino], HANS (1606-1668), Danish statesman and theologan was born on March 47, 1606, at Horses, where his father, Hans Riber, was burgomaster. His mother Anne was a darwher of the historian Hans Svaning, whose name, subsequently disced to Svane, he adopted. After seen years' residence ah: 4 Svane became professor of oriental languages at the min style of Copenhagen. In 1646 he turned to theology. He bec: bislop of Sjaelland in 1655. As a theologian he belonged to the severely orthook Lutheran school.

At the reside of 1660 he played an important political role. It was c, Svane's motan (Ort. 8) that the commons agreed to offer 'alcrick III the crown as a hereditary crown. Svane quashed the tunid attempt of the more bleral minded of the deputies to obtain from the king some sort of a constitution. He proposed the erection of a constitution. He proposed the erection of a constitution and poor rollef, anticipating to some extent the modern ministries of education and public worship, which unfortunately was not adopted The privileges which he obtained for the clergy increased the independence of the Danish Church in difficult times. Svane died on July 26, 1640.

SYEDBERG, "THEODOR (THE) (1884) Swedsh, chemist, invented the ultracentritings, a dovice, facilitating the study of colloids and high-molecular substances. Born at Cavleborg county, Swed, on Aug 30, 1884, Swedberg was educated at the University of Uppsala, where he was a professor of physical chemistry, 1972-51. He devoted himself to research in the field of colloidal chemistry, and in 7956 he was awarded the Nobel prize in chemistry "for his work (in colloids) on disperse systems."

SVEHLA, ANTONIN (1873-1032). Czech statesman, was born at Hostuvar, near Prague. He was a founder and (1900) chairman of the Caech Agrarian party. Contact with Thomas Masryk enabled him to complete the preparations for the final coup against Austra on Oct. 28, 1918, when in his capacity as were president of the Prague national committee, together with Soukup and J. Stribirny, he took over the government of the Czechosłowsk state on behalf of the Czechosłowsk state on behalf of the Czechosłowsk antional council, which in the summer of 1918 had been recognized as the Czechosłowsk state on behalf of the Czechosłowsk was the control of the Czechosłowsk was well with the summer of 1918 had been recognized as the Czechosłowsk when he formed a new coalition, reconstituted after the Oct 1925 elections, so as to include the "Big Business party." But on Marth 16, 1965, Swebla resigned. He formed his third administration on Oct. 28, 1926, two German Bohemians being included in his cabinet.

The German bourgeois group in the chamber supported him in a reversion to the four main provinces into which Czechoslovakia was divided before 1920, in preference to the county system then established.

Svehla's health failed in the autumn of 1927, and in Jan. 1929 he resigned.

(See also Czechoslovakia: History.)

SVENDBORG, a seaport of Demmatic, capital of the amticountry of its name, on the island of Fyn. Pop. (1950) 32,569. The narrow Svendborg Sund separates Fyn from the lesser islands of Taasinge (245 ft.) and Turps. Inland there is also elevated ground, the Ovinchysi. The harbour is accessible to vessels drawing 20 ft. Near the town are the ruined castle of grizold, the watering-place Christiansminde, and the orchards of Gammel Hestehave, where wine is produced.

SVENDSEN, JOHANN SEVERIN (1840-1911), Nor-

SVENDSEN, JOHANN SEVERIN (1840-1911) Norwegian composer, was born in Christiania on Sept. 30, 1840. He learned the violin from his father and, after serving in the army and touring with an orchestra, he entered the conservatorium at Lepizg through the aid of the king of Sweden. In 1883 Svendsen was at one time intimate with Wagner, his own music was not influenced by him. His works include two symphonies, a violin concerto, a romance for violin and orchestra, and Norwegian rhapsodies for the orchestra He died in Copenhagen on June 14, 1911

SVERDLOVSK (formerly Ekatermburg), chief town of the Sverdlovsk region of the Russian S F.S R. on the east foothills of the Ural mountains. It is the centre of a gold, platinum, copper and coal-mining district; its population rose from 55,488 in 1897 to 425,544 in 1939 There are copper mines and electric power plants which supply the numerous industrial undertakings, including iron, copper smelting, platinum refining, the manufacture of machinery and linen goods. There is also a jewel cutting and polishing industry, Sverdlovsk emeralds being spe-cially famous. Mining was developed there by Peter the Great in 1721 and the town was named Ekaterinburg in honour of his wife Catherine I. In 1735 a government mint for copper comage was established and later a government engineering works, and an imperial factory for the cutting and polishing of ornamental stones. In 1763 the Siberian highway was diverted to the town from Verkhoturve. This helped the two annual trading fairs, dealing mainly in cattle, cereals, iron, woollen and silk goods, and products from Siberia and central Asia. Later the town became a railway centre and developed rapidly; it is well built, with wide streets. The Cathedral of St Catherine's was completed in 1758. and that of the Epiphany in 1774 Sverdlovsk was a storm centre during the civil wars following the 1917 revolution, and it was captured by the Czech army under Gajda Later the world received news that in July 1918 the Tsar Nicholas II and his family had been executed in a house formerly belonging to a merchant named Ipatiev (ten years later Mrs Anna Tschaikovsky entered a claim that she was the Grand Duchess Anastasia, Nicholas' youngest daughter, who had been spared the fate of her family by two soldiers, one of whom she was obliged to marry; in 1939 she began suit in Berlin to recover money deposited by Nicholas in a German bank, but the case was suspended until after the war).

SVERDRUP, JOHAN (1816–1892), Norwegian statesman, was born at Jarlsberg on July 30, 1816 His father, Jakob Sverdrup, was a land steward, and the founder of the first school of agriculture in Norway. Johan entered the Storthing in 1850. He built up a strong political party, supported by the peasantry, and in 1872, secured a bill for the admission of ministers to the Storthing, which was a step to parliamentary control. King Charles XV. refused his sanction to this bill, and on its third passing in 1880 Oscar II opposed his absolute veto. Sverdrup then proposed the proclamation of the law in defiance of the king's action. The retirement of Frederik Stang removed Sverdrup's chief political opponent from the field. He was aided in his campaign by Björnstjerne Bjornson, and after a series of political crises he became prime minister in June 1884. He soon found himself at issue with Björnson on church matters, although during his term of office no fewer than eighty-nine measures, many of them involving useful reforms, became law, he failed to satisfy the extremists and was driven to rely on the moderate Liberals. He was compelled to retire in 1889, and died on Feb 17, 1892, at Christiania

SWABIA, SUABIA or SUEVIA (Ger. Schwaben), one of the stem-duchies of mediaeval Germany, taking its name from the Suevi, a tribe who inhabited the district in the first century of the Christian era. They were joined by other tribes, and the district was called Alamannia, until about the 11th century, when the form Swabia began to prevail. In 496 the Alamannı were defeated by Clovis and governed by dukes dependent on the Frankish kings. In the 7th century the people were converted to Christianity, bishoprics were founded at Augsburg and Constance, and in the 8th century abbeys at Reichenau and St. Gall. The Alamanni had gradually thrown off the Frankish yoke, but in 730 Charles Martel again reduced them to dependence.

The duchy, bounded by the Rhine, the lake of Constance, the Lech and Franconia, was ruled by the counts of Raetia, one of whom, Burkhard, took the title of duke in 917 and was

became court kapeilmeister at Copenhagen Though Svendsen his death in 926 he was succeeded by Hermann, a Franconian noble, who married his widow. When Hermann died in 948 Otto the Great gave the duchy to his own son Ludolf, who had married Hermann's daughter Ida; but he reduced the ducal privileges and appointed counts palatine to watch the royal interests Ludolf revolted and was deposed, and other dukes followed in quick succession. During these years the Swabians were loyal to the kings of the Saxon house. In 1077, Rudolph, count of Rheinfelden, as duke, was chosen German king in opposition to the emperor Henry IV, but found little support in Swabia, which was given by Henry to his faithful adherent, Frederick I, count of Hohenstaufen Frederick II succeeded his father in 1105, and was followed by Frederick III, afterwards the emperor Frederick I. The earlier Hohenstaufen increased the imperial domain in Swabia, where they received steady support, although ecclesiastical influences were very strong After numerous changes, the chief authority in Swabia in 1268 fell to the counts of Wurttemberg, the margraves of Baden, the counts palatine of Tubingen and the counts of Hohenzollern

SWABIAN LEAGUE, an association of German cities, principally in the old duchy of Swabia. The cities had attained prosperity under the Hohenstaufen emperors, but on the extinction of that house in 1268, they were ill-defended against aggression by succeeding dynasties

In 1331, 22 Swabian cities, including Ulm, Augsburg, Reutlingen and Heilbronn, formed a league at the instance of the emperor Louis the Bavarian, who in return for their support promised not to mortgage any of them to a vassal. The count of Wurttemberg was induced to join in 1340. Under Charles IV the lesser Swabian nobles began to combine against the cities, and formed the Schlegelerbund (from Schlegel, a maul). Civil war ensuing in 1367, the emperor, jealous of the growing power of the cities, endeavoured to set up a league under his own control, for the maintenance of public peace. The defeat of the city league by Eberhard II. of Württemberg in 1372, the murder of the captain of the league, and the breach of his obligations by Charles IV., led to the formation of a new league of 14 Swabian cities led by Ulm in 1376 This league triumphed over the count of Wurttemberg at Reutlingen in 1377, and the emperor having removed his ban, it assumed a permanent character, set up an arbitration court, and was rapidly extended over the Rhineland, Bavaria and Franconia. Its professed aims were the maintenance of the imperial status of the constituent cities, the security against sale or mortgage and against excessive taxation, the protection of property, trade and traffic, and the power to suppress disturbances of the peace. There is no trace of co-operation with the Hanseatic towns

For nearly a century there was no great effort at federation among the Swabian cities, though there were partial and shortlived associations. The growing anarchy in Swabia, where the cities were violently agitated by the constant infringement of their liberties (e.g., the annexation of Regensburg by Bavaria in 1486), induced Frederick III, who required men and money for the Hungarian War, to conciliate the cities by propounding a scheme of pacification and reform. His commissioner, Count Hugo of Werdenberg, met the Swabian estates at Esslingen, and on Feb. 14, 1488, the Great Swabian League was constituted. There were four constituent parties, the archduke Sigismund of Austria, Count Eberhard V. of Wurttemberg, who became the first captain of the league, the knightly league of St. George, and lastly 22 Swabian imperial cities. The league received a formal constitution with a federal council consisting of three colleges of nine councillors each, a captain and a federal court with judicial and executive powers. The armed force which was to police Swabia consisted of 12,000 foot and 1,200 horse, each party contributing one-fourth. The league gained strength by the speedy accession of Augsburg and other Swabian cities, the margraves of Brandenburg-Ansbach, Bayreuth and Baden, the four Rhenish electors, etc., and in 1400 of Maximilian, king of the Romans. whom the league had helped to rescue from the hands of the Netherlanders in 1488. It did not render him the support he recognized as such by King Henry I., the Fowler, in 919. On expected in his foreign policy, but it performed its primary work

of restoring and maintaining order with energy and efficiency. In 1492 it compelled Duke Albert of Bavaria to renounce Regensburg; in 1519 it expelled the turbulent duke, Ulrich of Wurttemberg who had seized Reutlingen, and it sold his duchy to Charles V : and in 1523 it defeated the Franconian knights who had taken up arms with Franz von Sickingen In 1525 Truchsess, the league captain, aided by the forces of Trier and the palatinate, overthrew the rebel peasants of Konigshofen on the Tauber and at Ingolstadt. The league, after several renewals, expired on Feb 2, 1534, its dissolution being due to the Reformation. Futile attempts were made to renew it, in 1535 by the Bavarian chancellor, Eck, and in 1547 by Charles V.

See E Osann, Zur Geschichte des schwäbischen Bundes (Glessen, 1361), K. Klüpfel, Urkunden zur Geschichte des schwabischen Bundes (Stuttgart, 1846-53), "Der schwabische Bund," Hist. Taschenbuch (1883-84).

SWAFFHAM, an urban district in Norfolk, England, 28 mi. W of Norwich by road, in the Southwest Norfolk parliamentary division Pop (1951) 2,863. Area 11.9 sq.mi. It is a market town and agricultural centre with a fruit-canning industry. To the south are vast plantations of the Forestry commission. The cruciform church of St. Peter and St Paul is Perpendicular, with a fine double hammerbeam roof. In the church library is the Black Book of Swaffham, one of the earliest existing church terriers. At Castle Acre, 4 mi N., are the ruins of a Cluniac priory founded shortly after the Conquest by William de Warenne

SWAHILI, Wa-Swahils from Arabic sahil, ruast, a term applied to the inhabitants of the East African coast from Mogadishu to Kılwa and of the islands of Zanzibar, Pemba and Comoro They are a mixture of African and Arab, the African element being based on a local Bantu people with a large admixture of slaves from all over East and Central Africa. Their language, Ki-Swahili, has a purely Bantu grammar and a large Arabic vocabulary.

The Swahili are not a tribe, but a people united by a common language and religion (Islam). Though their culture is largely Islamic, there remain many traces of their African origin and some Indonesian and other non-African elements. The chief Swahili dialects are Ki-Unguja of Zanzibar (now the standard form); Ki-Mvita of Mombasa; and Ki-Amu of Lamu Older forms are Ki-Ngozi and Ki-Kae. There is a large body of Swahili poetry and prose, written in Arabic, comprising secular and religious works.

(G. W. B. H) SWAHILI LANGUAGE. Swahili belongs to the Bantu family of languages (q.v.) and is spoken on the eastern coast of Africa, ranging approximately from Warsheikh, on the Somali coast, to the mouth of the Ruvuma (10° 30' S). It has also obtained wide currency as a trade language, having been carried by Arab caravans to the region of the Great Lakes before the middle of the 19th century and, since then, through European influence, into the Congo basm; and, in a very debased form, it is the vernacular of some Pygmy tribes on the Ituri.

Origin and History of the Language.-Swahili is not the language of any particular tribe; it grew up among the descendants of the Arab settlers on the coast, who intermarried with native women-usually Bantu. The name is derived from the

Arabic Sahil ( الحامل), which means "the coast," the Arab colonists and their descendants being known simply as "the Coast-

Pokomo, the speech of a very interesting Bantu tribe inhabiting the Tana valley, may have formed the groundwork of Swahili. The Pokomo would probably be the first Bantu tribe to meet the Arab colonists. Intercourse between Arabia and the east coast of Africa is as early as the 1st century A.D., when, as we learn from the Periplus of the Erythraean Sea, the people of Muza (in Southern Arabia) "sent thither many large ships, using Arab captains and agents, who are familiar with the natives and intermarry with them

But the earliest known settlement, that is Pate, is said to have been founded A.D. 689.

The Swahili language was first made known to Europeans by Henry Salt, whose Travels (he visited Abyssinia in 1809, by way of the Cape of Good Hope) was published in 1814. He calls it

"Sowauli" and gives a short and very imperfect vocabulary. The first real study of the language was made by Johann Ludwig Krapf, 1810-82, a German who went to East Africa in the service of the Church Missionary Society, reaching Mombasa in 1844-His dictionary, recently revised and supplemented by Archdeacon Binns, is still a standard work; the principal English contributors to the subject are Edward Steere (Bishop of Zanzibar from 1874 to 1882), Arthur C Madan (d. 1920) and the late William Ernest Taylor, for many years a missionary in Kenya Colony

Character of the Language.—Swahili is a Bantu language. Its grammatical structure has been little affected by Arabic influence It includes Arabic words. Contact with outside influences has tended to efface some characteristic Bantu peculiarities and brought about an extensive use of borrowed prepositions and adverbs, which gives it greater elasticity and increases its pos-

sibilities as a literary language.

Swahili has no grammatical gender, but a division of nouns into classes, each with its characteristic pronoun; it inflects nouns by means of prefixes, makes the possessive agree with the thing possessed ("the house of the man" not "the man's house"), and places the object-pronoun between the subject-pronoun and the verb, as if one should say "I him saw," in one word. Though these classes and their concords look formidable, the language is by no means difficult to learn and is quite easy to pronounce.

As the official language of Kenya Colony and Tanganyika Territory, it is indispensable to all civil servants, to settlers, missionaries and business men. It is spoken and understood by many

natives, even where it is not the local vernacular.

Dialects and Literature.—The principal dialects are those of Lamu (northern), Mombasa (central) and Zanzıbar (southern); the last-named being the standard for official use. That of Lamu has preserved many archaisms and comes nearest to that known as "Kingozi," in which the ancient poems, and those more recently imitated from them, are composed. A large body of poetry exists in manuscript, some few specimens having been published in Europe. The metres used are adapted from the Arabic, as closely as the differing rhythm of the two languages permits. Those traditionally attributed to Liongo Fumo may, if authentic, go back to the 12th or 13th century, and their language is certainly very archaic. In prose, almost the only texts available till recently, have been taken down by Europeans from native recitation, but of late years (not to mention translations made by Europeans) native writers have begun to appear, and the Swahili magazine, Mambo Leo published at Dar-es-Salaam, under European editorship, attracts an increasing number of native contributors. There is an immense amount of traditional matter in circulation: folk-tales, some indigenous to the soil, others of Indian, Persian or Arab origin, which, filtered through generations of oral transmission, have acquired a distinctly African colouring. The people, both men and women, have the same facility of improvisation as the Italian peasants. Some songs have a rhythm (probably chanted to the drum) but no metre. Others have both metre and rhyme, often of a very pleasing character. Songs and proverbs -frequently very pithy-have been collected.

"Bibliochapter, "Steer, A Haddook of the Swahill Language as spoken at Zennabar (1871, trequently reprinted); Knapf, A Dickionary of the Swahill Language (1883; revised and augmented edition 1925); A. Wernet, The Bonks Languages (1891, bull); A. and M. Werner, The World Book (1971).

SWALLOW. The name for birds of the passerine family Hirundinidae. With graceful flight, and much twisting and turning. the swallows seek their insect food in the air, and the features that characterize the family are adaptations for this: the long pointed wings, the small feet, the short, broad bill and the wide gape, About 74 species of small to medium-sized birds comprise the family. Their colours are not gaudy, but many species have rufous or glistening white and iridescent deep blue or green in the plumage. The range of the family is almost world-wide. The species breeding far north and south are strongly migratory, and some make long journeys across the equator to reach their winter quarters.

Swallows like company; they gather to feed in favourite spots; great numbers may assemble in the late afternoon to roost together

during the night, and many species nest in colonies Certain species come commonly about human habitations and nest on buildings or in nest boxes prepared for them. Though hardly songsters, their twitterings and chirping notes are pleasant, and this plus their familiar habits and their returning to temperate climates with the spring has given them a friendly place in people's minds and in literature

Their nesting is various: in a hole in a tree or bank, in a burrow dug by themselves in an earthen bank, a saucer-shaped structure on a ledge of rock or a building, or a retort-shaped structure of mud pellets stuck to the side of a cliff or a building. There may be up

to six eggs, pure w 'ite or spotted.

In a restricted sense "the swallow" is used for a familiar species, Hirundo rustica, in England. The name martin (q v ) is used for (A L, Rp) some swallows.

SWALLOW-HOLE, a cavity, forming the entrance to a subterranean stream channel, produced by the solvent action of naturally acidulated water. Such holes are most commonly found in limestone and chalk districts (See CAVE.)

SWAMMERDAM, JAN (1637-80), Dutch naturalist, was born on Feb. 12, 1637, at Amsterdam, the son of an apothecary and naturalist. After a visit to Paris, he took his degree in medicine

at Leyden in 1667.

Neglecting his practice, he became a pioneer of microscopy. He made a comparative study of insect life histories, which he classified according to the type of metamorphosis. He held that his observations supported the preformation theory of embryology. He went into minute details of the internal anatomy of the mayfly and the bee. He observed the cleavage of the frog's egg and the subsequent segmentation and studied the anatomy of tadpole and adult. He described the ovarian follicles of mammals in the same year as Régnier de Graaf (1672). An improved technique of injection aided his study of human anatomy.

Swammerdam discovered the valves of the lymphatics and was the first to describe the red blood corpuscles (1658). By a welldevised experiment he showed that the muscles alter in shape but not in size during contraction; this contradicted the current theory that a material fluid passed down the nerves to cause movement.

He was the first to draw the sporangia of the fern. Deeply religious and somewhat unstable, after a quarrel with his father, he became for a time a disciple of Antoinette Bourignon. He died in Amsterdam on Feb. 15, 1680, after a period of deep spiritual and bodily misery.

spintotal and todary ansesty.

His books, some of them magnificently illustrated, were: Tractatus physico-anatomico-medicus de respiratione usuque pulmonum (Leyden, 1050); Alfquenese verlandatus, you bloeddoose disteption (Uterdit); (1506); Alfracodium naturae seu uteri mulitoris lobrica (Leyden, 1072); in and Sphemerae vou (Amserdam, 1073). H. Boerhaave published a collection of his manuscripts, Biblia naisurae (Leyden, 1737–186). (A. C. C. S.)

SWAMP, a tract of wet, spongy, low-lying land, usually over-grown with vegetation, but too highly saturated with water to be fit for agricultural or pastoral purposes. The term swamp, however, is often indiscriminately applied to various wet, watery or miry places, as a marsh or a bog or, as in Australia, a shallow pond or lake. But as more commonly understood, especially in the United States where the word first came into recorded use (early in colonial days), a swamp is an area of very moist or wet ground, with luxuriant vegetation, and largely free from standing water. It thus differs from a marsh, which is covered for the most part with a thin sheet of water. A swamp differs in a corresponding degree from a bog, which is a very wet, water-logged area. practically without drainage, in which extensive decomposition of vegetable matter is taking place, forming in northern latitudes deposits of peat (q.v.). A marsh or a bog may occur within or may border upon a swamp, with various intermediate stages in each case; hence the frequent interchange in meaning between these terms in popular usage.

The character of the vegetation in swamps varies with the nature of the soil and the extent of drainage. Usually swamps are filled with a dense growth of coarse grasses, trees and shrubs. Swamps are found on the shoreward side of tidal marshes along seacoasts and near inland lakes and ponds with low shores; swamps are common also in the alluvial valleys of rivers and smaller streams

Among swamps possessing marked historical as well as scientific interest are those in the Campagna near Rome, and those found in the Pripet marsh region in western Russia Noteworthy swamp areas in the United States are the Great Dismal swamp in southeastern Virginia, the cypress and the mangrove swamps of the southern states, and the "tule" swamps of the San Joaquin valley in California Vast swampy and boggy areas in northern Canada are known by the Indian name muskeg.

SWAMPSCOTT, a beautiful residential town and summer resort of Essex county, Massachusetts, U.S.; on Massachusetts bay, 13 mi NE of Boston, adjoining Lynn It is served by the

Boston and Maine railroad Pop. (1950), 11,580.

SWAN, SIR JOSEPH WILSON (1828-1914), English physicist and electrician, was born at Sunderland on Oct 31, 1828 After serving his apprenticeship with a druggist in his native town, he became first assistant and later partner in a firm of manufacturing chemists in Newcastle,

Among its operations this firm included the manufacture of photographic plates, and thus Swan was led to one of the advances in photography with which his name is associated—the production of dry plates, which were the outcome of an original observation made by him on the effect of heat in increasing the sensitiveness of a gelatine bromide of silver emulsion In 1862 he patented the first commercially practicable process for carbon printing in photography (See Photography.) In 1879 Swan patented bromide paper.

In 1860, he produced an electric lamp with a carbon filament which was formed by packing pieces of paper or card with charcoal powder in a crucible and subjecting the whole to a high temperature. The carbonized paper thus obtained he mounted in the form of a fine strip in an evacuated glass vessel and connected it with a battery of Grove's cells, which though not strong enough to raise it to complete incandescence, were sufficient to make it red-hot. This was substantially the method adopted by Edison nearly twenty years later.

Subsequently Swan devised a cotton thread "parchmentized" by the action of sulphuric acid, and on Oct 20, 1880, he gave at Newcastle the first public exhibition on a large scale of electric lighting by means of glow lamps. In another method devised by him, collodion was squirted into a coagulating solution and the tough threads thus obtained carbonized by heat. He also devoted attention to apparatus for measuring electric currents, to the improvement of accumulators and to the conditions governing the electrodisposition of metals.

Swan was knighted in 1904. Holding many honours, he died at Warlingham on May 27, 1914.

SWAN, the name for birds of a group that contains the largest waterfowl (family Anatidae). With long necks and short legs, they are most at home on the water, where they feed on aquatic plants. They also eat some grass and grain, though they walk somewhat awkwardly on the land.

There are seven kinds of swan. Five, all white in colour, live in the northern hemisphere; a black necked swan, Cygnus melancoriphus, lives in southern South America, and a black swan,

Chenopis atrata, in Australia.

The common swan of ornamental ponds everywhere is the mute swan, Cygnus olor, native of northern Europe and Asia. It is easily recognized by its pink bill and black knob on its forehead. black swan is also kept as an ornamental bird, and has been introduced and is thriving in New Zealand.

Swans are said to mate for life During the winter they live in flocks, but with the approach of mating time the pairs separate and establish breeding territories which they guard jealously. The eggs, four to six in number, are cared for by the female except with the black swan, the male of which shares nest duties. male is vigorous in its defense of nest and young In captivity it may kill geese and ducks and even be dangerous to children. Some swans utter only a hiss, while others have loud trumpetlike (A T. Rn)

SWAN, HUNTER, AND WIGHAM RICHARDSON, LTD. The "Prince Albert," the first iron vessel ever built on the Tyne, was launched in 1842, from the Neptune works of the firm In 1850, the present Neptune shippard was opened, with a pay-roll of 200 men The Wallsend shippard of the company, owned by C. S Swan and Hunter, was established in 1872, and in 1880 employed 700 men In 1903, C S. Swan and Hunter, Ltd, Wigham Richardson and Co, Ltd, and the Tyne Pontoons and Dry Docks Co., Ltd , became Swan, Hunter and Wigham Richardson, Ltd., and today is associated with Barclay, Curle and Co, Ltd., on the Clyde, and the Glasgow Iron and Steel Co, Ltd., Wishaw The company has 16 shipbuilding beiths on the Tyne, of which the largest are capable of taking vessels up to 1,000 ft in length, Four of these, at the Wallsend shippard, are covered by glass-roofed sheds fitted with electric light, enabling work to proceed in any weather and by day or night. The capacity exceeds 150,000 gross tons a year.

The company builds all classes of naval and mercantile vessels At the Tyne shippard there were under construction (1939) the battleship "Jellicoe," the cruisers "Mauritus" and "Gambia," the destroyers "Janus" and "Khartoum," 4 escort ships, caissons, passenger and cargo ships, oil tank ships, a cable ship, etc., and the large motor passenger and cargo liner "Dominion Monarch" was completed in January 1939 More than 30 floating docks have been built by the company in recent years. One of them was towed through the Straits of Magellan to Peru, a distance of 11.000 miles; another was the immense floating dock for the Singapore naval base, with a lifting capacity of 50,000 tons, which had to be towed out in several parts, barely scraping through the Suez canal The firm built the "Mauretania" (32,000 gross tons; launched in 1906), for the Cunard company, which, while more than once crossing the Atlantic at an average speed of 26 knots, averaged 25½ knots for 27 consecutive voyages During World War I nearly 100 warships, with 230 other vessels, were built by (LCM;X) the company

SWANAGE, a seaport and urban district, Dorset, England. Pop (1938) 5,970. Area 4 3 sq.mi. It has on the so-called Isle of Purbeck, south of Poole harbour. The coast is wild and precipitous; numerous caves occur in the cliffs. The bay affords excellent bathing. Stone from the Purbeck quarries is exported.

SWANSEA, Welsh Abertawe, a municipal, county and parliamentary borough and seaport of Glamorganshire, Wales. Pop.

(1938) 161,100. Area, 37 9 sq mi. The Via Julia from Nidum (Neath) to Loughor probably passed through the north of the borough, where Roman coins were found in 1835 The name Swansea stands for Sweyn's "ey" or mlet, and may have been derived from Sweyn Forkbeard, who certainly visited the Bristol Channel, The earliest known form of the name is Sweynesse, which occurs in a charter granted by William earl of Warwick some time previous to 1184; in King John's charter (1215) it appears as Sweyneshe, and in the town seal, of mediaeval origin, it is given as "Sweyse." The Welsh name, Aber Tawy, first appears in Welsh poems of the beginning of the 13th century. The town grew up round the castle which Henry de Newburgh (or Beaumont) on his conquest of Gower about 1000 built on the west bank of the river. The castle eventually came by marriage to the Somersets and is still held by the dukes of Beaufort, It was finally destroyed by Owen Glendower. In the Civil War the town was royalist till the autumn of 1645 when Colonel Philip Jones was made its governor. The older part of the town, being the whole of the municipal borough previous to 1836, occupies the west bank of the Tawe near its mouth and is now wholly given up to business. Stretching inland to the north along the river for some 3 mi. through Landore to Morriston, and also eastwards along the sea margin towards Neath, is the industrial quarter, while the residential part occupies the sea front and the slopes of the Town hill (580 ft. high) to the west, stretching out to Sketty. The Mumbles or Oystermouth and a large part of the Swansea rural district were included in the borough in 1918. The east side of the river is known as St. Thomas's and Port Tennant.

entirely disappeared; but of the new castle, which was probably intended only as a fortified house, there remain the great and lesser halls, a tower and a so-called keep with the curtain wall connecting them, its chief architectural feature being a fine embattled parapet with an arcade of pointed arches in a style similar to that of the episcopal palaces of St. David's and Lamphey built by Henry Gower (d 1347), hishop of St David's, to whom the building of the new "castle" is also ascribed Possibly some traces of St David's hospital, built by the same prelate in 1331, are still to be seen at Cross Keys inn The parish church of St Mary was entirely rebuilt in 1895-98 Of the earlier work there remain the door of the rood loft (built into a wall), and a few private memorials Within the parish of St. Mary was St. John's, a church once owned by the Knights Hospitallers This church, which was entirely rebuilt in 1820, was renamed St. Matthew in 1880, when a new St. John's was built within its own parish. The Royal Institution of South Wales, founded in 1835, possesses a museum in which the geology, mineralogy, botany, prehistoric and later antiquities of the district are well represented. Its library is rich in historical and scientific works relating to Wales and Welsh industries. The free library and art gallery contains exhibits of local and general Welsh interest. The Glynn Vivian Art gallery was opened in 1915 Near the shore at the west end of the town is the new guildhall, opened in 1934 It is notable as containing Frank Brangwyn's 16 panels depicting the peoples, flowers, fruits and animals of the empire, originally painted for the royal gallery of the house of lords as part of a peers' war memorial. The grammar school was founded in 1682 by Hugh Gore (1613-1691), Bishop of Waterford A college was added to the University of Wales in 1920, with a site in Singleton park (250 ac) The town has about 3,000 ac of open spaces, including Liewelyn park (42 ac). De Braose's charter of 1305 gave the burgesses the right to take from the lord's woods sufficient timber to make four great ships at a time and as many small vessels as they wished Coal was even then worked in the district. Cromwell in his charter of 1655 recognized Swansea as "convenient for shipping and resisting foreign invasions" Its status was only that of a "creek" in the port of Cardiff till 1685, when it was made independent.

From about 1768 to 1850 Swansea had a famous pottery. Beginning with earthenware which twenty years later was improved into "opaque china," it produced from 1814 to 1823

superior, beautifully decorated porcelain.

During the 18th century coal began to be worked at Llansamlet and copper smelting (begun at Swansea in 1717, though at Neath it dated from 1584) assumed large proportions. The coal was conveyed on the backs of mules and later by means of a private canal. Under an act of 1791 harbour trustees cleared the river bed and built a long pier on either side of it. A canal connecting the tidal part of the river Neath with the mouth of the Tawè made in 1789, was in 1824 connected with the Vale of Neath canal by means of an aqueduct across the Neath river, when also a small dock, Port Tennant or Salthouse dock, was made near the east pier, and this continued to be used till 1880. Meanwhile in 1798 the entire coal-producing Swansea valley was connected with the port by a canal 161 mi long (acquired by the G.W.R. in 1872). In 1851 the river was diverted eastward into a new channel (called the New Cut) and its old channel was locked and floated, thereby forming the North dock. (Area 112 acres, and a half tide basin 21 acres, Length of quays 5,500 ft.) The Swansea Valley canal has a connecting lock with this dock, and on the island between the dock and the New Cut are patent fuel works, copper ore yards and other mineral sheds. The South dock, begun in 1847 and opened in 1859, is mainly used for shipping coal and for discharging timber. It has an area of 18½ acres; length of quays 6,550 ft.; depth of water in lock 34 ft. The next development was on the east side of the river where the natural inlet of Fabian's bay, inside the harbour mouth, was utilized for the construction of the Prince of Wales's dock (authorized 1874, opened October 1881, and subsequently extended), area 28 acres; length of quay 6,872 ft. and it is con-The castle, first built by Henry de Newburgh about 1099, has nected with the Tennant canal. The very rapid increase in the demand for anthracitic coal (for the shipment of which Swansen has practically a monopoly) soon necesstated still further accommodation and in July 1904 was begun the King's dock, which lies faither east and has an entrance direct from the bay. By means of the embankment made in connection with it, 400 acres were reclaimed from the sea. King's dock and basin is 71 acres, depth of water, a full, (high tidée), length of quays, 14,050 ft. The Queen's dock, used mainly by the Anglo-Persan Oil Co., is 150 acres with 2,400 of of quays. There are numerous privately owned dry docks. The entire harbour has some 281 acres of deep water in the docks and over 6 miles of quay. The imports include time her, ores (copper, silver, non, etc.), grain, pig 170n, crude oil, etc. The exports are coal, patent fuel, refined oils, coke, tim-plate, etc.

The town (which is often called the metallurgical capital of Wales) is the chief seat of the copper, spelter, tin-plate and patent fuel industries. Copper smelting, which during most of the 19th century was the chief industry, was later replaced by copper retining, but there-fourths of the in-plate manufactured in Great Britain and mneteen-twentieths of the spelter or zinc are made in the Swarsse affect, 86 factories being engaged in the work, Its tube works and manufacture of superphosphates are also very immortant.

From about 1918 Swamesa became an important centre for the distribution of oil, and extensive facilities for its storage and distribution of its storage and refining were provided. It was by reliance on the metallungcal industries and the facilities for dealing with other fuel besides coal that Swamesa escaped in some measure the depression that overtook the purely coal-exporting areas of the south Wales coal field in the late 1900s and 1930s. Trawlers usually land their catches set at the south dock, where there is a well organused falls market. In 1935 a great power station connected with the national grid was occessed.

Administration.—The town claimed to be a borough by prescription, for its only known charters of incorporation are those of Cromwell and James II, which were never acted upon. It probably received its first grant of muncipal privileges from William and earl of Warwick some time before risk4. Cromwell's charter of 1655 changed the title of portreeve into mayor. Four annual fairs were appointed, namely on the 8th of May, and of July, 15th of August and 8th of October—the first being the only new one. These are still held.

From 1535 to 1832, Swansea with other boroughs of Glamorgan sent one member to parliament. In 1658, Cromwell gave Swansea a member of its own but the grant lapsed with the Restoration. In 1832, Swansea, with added parishes, was again granted a member and in 1885 a second member was added. The assizes and quarter sessions for Glamorgan are held at Swansea alternately with Cardiff. The borough has a separate commission of the peace, and a court of quarter sessions. It became a county borough in 1888. In 1932 the "Church in Wales" created a bishorite of Swansea and Brecon.

In Feb. 1941 the whole civilian centre of the town was destroyed

by air raids

"SWANWICK, ANNA (183,5-189,). English writer and philanthropust, was born at Laverpool on June 24, 183, She went in 1839 to Berlin, where she took lessons in German, Greek and Hebrew. In 1843 her first volume of translations, Selections from the Dramas of Goethe and Schiller, appeared, followed by a translation of Schiller's hungfrow one Orleans (1847), and others of Faust, Taxso, Iphigenie and Egmont (1850). In 1878 she published a complete translation of both parts of Faust, which appeared with Retsch's illustrations. In 1865 she published a blank verse translation of Aeschylus's Thieley, and in 1873, a complete edition of Aeschylus's Thieley, and in 1873, a complete chiton of Aeschylus, which appeared with Flaxman's Illustrations. Anna Swanwick was a founder of Queen's and Bedford colleges, and advocated the admission of women to universities. She died in Nov. 1869, 556 ML, Bruce, Armse Semmes (1903).

SWARAJIST. The term sweraj (more properly swarajya from swa-own or self; rajya-rule or government) was originally employed in the ethical sense of control over self—self mastery. Prominence was first given to it in the political arena by Dadabhai Naoroj, who, in his presidential address to the Indian national

congress in Calcutta in Dec. 1906 claimed as the right of India swara; "or self government like that of the United Kingdom or the Colonies," and the word soon gained currency as the equivalent of dominion home rule By a judicial decision of the Calcutta high court (1907, ILR, 34 Calc.), it was held not necessarily to mean "independent government" in the sense of government of the country to the exclusion of the present government "It may mean, as is now well understood, government by the people themselves under the King and under British sovereignty" Its adoption as the label of a particular political party was the outcome of the lengthy and ever-changing agitation set on foot by M K. Gandhi in 1919 That movement commenced as one of passive resistance to the legislation known as the Rowlatt act, which was designed to strengthen the hands of the government in dealing with revolutionary crime, but, utilizing the resentment aroused among Mohammedans by the Turkish peace terms, which crystallized in the Khilafat movement, and the excitement which ran through the country as the result of disturbances in the Punjab and their sequelae, Gandhi, in the succeeding year, launched a campaign of protest under the guise of nonviolent nonco-operation, which was to include the boycott of the courts and government schools, the resignation of titles and government office, and abstention from participation in the forthcoming elections to the new legislative councils under the Reforms scheme. In July 1920 the attainment of swaraj was included among the objects of the nonco-operation movement, and at the meeting of that year it was adopted by the Indian national congress as their avowed aim. But as to the precise meaning of swaraj there existed a vagueness which Gandhi did little to dispel At one time he defined it as parliamentary government, whether within or without the empire; at another as dominion home rule; at a third as the universal employment of the spinning wheel; yet again as the triumph of the Khilafat party. On the other hand, at the first meeting of the legislative assembly in Feb. 1921, in the message from His Majesty the King Emperor, the ideal of swaray was mentioned as the dream for years of patriotic and loyal Indians, while the reforms were cited as the beginnings of swaraj within the empire.

The first elections under the 1979 act Candhi's followers took no part, but an influential section of the congress, acting under the leadership of C. R. Das and Pandit Motlail Mehri, announced on Jan. 1, 1923, the formation of a Congress Khillard Swarijay party, in whose program the capture of the councils and the obstruction of all business in them was the leading immediate item. After protracted dissensions and manoeuvres this section was finally victorious within the congress, and at the elections of Nov. 1923 Swarajist candidates took the field as such and, noticeably as against the Moderates, achieved considerable success, though failing to secure (except in one province) the clear majority for which they had hoped. Throughout the term of the second reformed councils the Swaraj party continued their wrecking tacties, succeeding in two provinces (Bengal and the Central Provinces) in bringing about a temporary suspensional of the control of the cont

sion of the reformed constitution.

Toward the end of that year the party was split by the defections of some of its members, notably in Bombay and the Cartal Provinces, in the direction of "responsive co-operation," including the acceptance of office under government, and in April 1936 an attempt was made to form an Indian national party of responsivists, independents and moderates "to prepare for and accelerate the establishment of swaray or full responsible government in India, such as obtains in the self-governing dommions of the British empire." These differences bore fruit at the third election of the reformed councils at the end of 1936, when the Swaray party definitely lost ground, noticeably in the assembly and in the United Provinces, Punjab and Central Provinces. The Indian national congress (which by that time was practically the Swaraj party) in Dec. 1937 declared for the complete independence of India.

SWASTIKA, a decorative and symbolic omament consisting of a cross with equal arms, to the end of each of which is attached a line running at right angles to it, all these extensions occurring on the same relative side, so that all four extensions have the same rotary direction in relation to the centre. The

swastika is one of the most ancient and widespread of all ornamental forms, appearing in both henripherer. It is generally interpreted as a sun symbol. It occurs in Aegean and archaic Greek pottery and in certain types of fret, found in Egypt and Greece. In some examples it appears as two identical S-curves, intersecting in the middle and set at right angles. Occasionally three arms are found, and the heralick symbol of three running legs set radially, may be a development. Adolf Hiller made the swastika Germany's national symbol. See Dissoit. (T.F. H.)

SWAT, a princely state on the Peshawar border of the North-West Fronier Province of Pakustan, consisting of the valley of the Swat river above its confluence with the Panjkora, which is reached by the Malakand, the Shahkot and other passes from the south It has an area of 4,000 agm and a pop (1951) of 560,000.

The Swat river rises in the Kohistan, near the source of the Gilgit river and is utilized by canals to irrigate about 160,000 ac. A tunnel through the Malakand range taps the river much higher The old name of the river was Suastos, and that of the Panikora was Ghoura, under which names they figure in the history of Alexander's campaign. The upper valley is closely gripped between mountain spurs of the Hindu Kush The valley, narrow though it is, and traversed by the worst conceivable type of hill tracks, is fairly thickly populated The district lies on the direct road to Chitral The Swatis are a clan of Yusafzai Pathans numbering 40,000. They are Suni Mohammedans. The present ruler. the Walt, consolidated his rule throughout the Swat area by both warfare and diplomacy and turned his little kingdom into a model government amid the traditionally turbulent transfrontier areas. The Wali installed a telephone system to his leading villages, with whose headmen he thus confers every morning. He built a model hospital. He tours his kingdom in a modern car over the roads that he has built, but keeps a rifle by his side as a precaution.

SWATOW (also SHAN'TOW), a port in the province of Kwangtung, China, at the mouth of the main branch of the Han river. The population in 1940 was 178,650. Swatow was formerly a small fishing village, and the present town was built to a large extent on reclaimed land. English merchants settled on Double Island, in the river, as early as 1856 and began trading. Swatow is a great emigration port and was the scene of many kidnapping adventures on the part of foreigners in the early days. The region retained a full tribal organization until the latter half of the 19th century. Serious difficulties arose with the T'aip'ing rebellion and foreign interferences. The city is the outlet for Chao-chow, about to mi, up the river, and the centre of a sugar-cane district. Bean cake is manufactured and was also imported from Niuchwang, Shanghai and Hong Kong. Among usual leading exports are tea (after about 1872), sugar and oranges, paper, tobacco, grass cloth (manufactured at Swatow from the so-called Taiwan hemp), lace, drawn thread work embroidery. The imports ordinarily include cereals, peas, beans, kerosene oil and piece goods. The port was opened to foreign trade in 1860. The town, situated at the southern end of Formosa strait, is exposed to fierce typhoons. The

Japanese occupied Swatow in 1939

SWAYTHIANG, SAMUEL MONTAGU, 18T BARON

(183-9-1917), British financier, was born at Liverpool on Dec 21,

1832, of a jewsh family named Samuel. He took by royal

leence the name of Montagu. He rose to be the head of the most

important arbitrage house in London. He was Eiberal M.P. for

the Tower Hamiles from 1835 to 1900; he was a member of the

Gold and Silver commission of 1839-90, being himself a bimel
allist. He was created a baronet in 1849, and raised to the peer
age in 1907. He was a zealous promoter of Jewish interests,

founding the loan fund of the Jewish board of guardians, the

Jewish workingmen's club and several synagogues. Lord Swayth
ling succeeded Sir Julian Goldsmid as chairman of the Russo
Jewish contingnen's club and septed to establish a modern secular

school for Jews at Jerusalem (1875). He died on Jan. 12, 1911,

in London. His son. E. S. Montagwa was secretary for India.

SWAZI. The Swazi are an African tribe of the Embo-Nguni group of Bantu people. They speak a language closely allied to Zulu and Xosa. The political system consists of a hereditary paramount chief (Ngwenyoma) who is the central figure of the tribe in

political, social, military, religious and economic affairs His muther (Nidounhato) occupies a unique position and must be considered in the property of the p

SWAZILAND, British protectorate in southern Africa, administered by the high commissioner for Bustudiand, the Bedunalland protectorate and Swailand It is a compact country of 6/946 sg mi surrounded on three sides by the Union of South Africa and on the east hemmed in from the sea by Portuguese East Africa, or Mozambique

Physical Geography .-- The territory consists of three fairly well-defined regions of about equal breadth running from north to south. The mountainous high country to the west is a spur of the Drakensberg which reaches altitudes of about 5,000 ft. The average rainfall in this region is 55.6 in, although it varies considerably from year to year and from place to place. This region provides good winter pasturage for sheep and is suitable for afforestation The middle yeld to the east is characterized by wide valleys with less rainfall (average about 36 in.) but suitable for mixed farming. There the tributaries which flow down steep gorges join to form the main river system which drains the territory into the Indian ocean. These rivers, the Komati, the Mbuluzi, the Usutu and the Ngwavuma, traverse the Lubombo flats which comprise the low country. the only considerable area of fairly level ground lying about 500 ft. above sea level and consisting of fertile soil with savannah type vegetation and good pastures. The rainfall is low (average about 20 in.) and badly distributed. The main rivers on their course eastward to the sea in Portuguese territory cut through the Lubombo range.

History.-According to their traditions the Swazi lived origipally in southern Tongaland on the southeastern littoral of South Africa whence they migrated at the beginning of the 19th century to Shiselweni; s.e., the country to the west of the Lubombo range between the Pongolo and Great Usutu rivers. There they remained until 1815 when, being attacked by the Ndwandwe chief, Zwide, the main portion of the tribe under their chief Somhlolo, otherwise Sobhuza I, fled northward to the present site under the Mdzimba mountain near Bremersdorp. Under Somblolo's successor Mswazi, who gave his name to the tribe, they occupied considerable areas in what is now a portion of the Union of South Africa, and conquered and assimilated petty tribes or clans of Sotho origin. After their flight from Zwide the Swazi were occasionally raided by the Zulu and themselves made forays into neighbouring territory. Mswazi made an abortive attempt to check the depredations of the Zulu by seeking the protection of Oueen Victoria through Theophilus (later Sir Theophilus) Shepstone

ophilus (later Sir Theophilus) Shepatone
More formal richations with Europeans were established with the

By 1878 white settlers and prospectors had established themselves in considerable numbers in Swaziland, attracted by the fertile and well-watered terrain abounding in game and rich in the promise of minerals. They secured concessions over land, minerals and grazing as well as to exemptions from taxes, to railways, to telegraphs, to mining patents, collection of the revenue and trading.

In 1888 a charter of self-government was granted to the Europeans, and two years later, under a convention between the British government and the South African Republic of the Transvaal, a provisional government, consisting of representatives of the two powers and a representative of the Swazi, was set up with the consent of the latter Three years later the provisional administration came to an end when the British government signed a new convention permitting the South African republic to acquire from the Swazı regent and her council an organic proclamation conferring on the republic rights of jurisdiction, legislation and administration without incorporation into the republic. The Swazi refused to sign the proclamation, but its provisions with some of those in the 1893 convention were embodied in the final convention of 1894 under which the South African republic exercised powers of protection, legislation, jurisdiction and administration in Swaziland subject to the limitations of the convention After the conquest of the Transvaal all the rights and powers of the republic passed to Great Britain, and an order in council under the Foreign Jurisdiction act was issued in June 1903 providing that the gover-nor of the Transvaal should administer Swaziland and conferring on him the right to legislate by proclamation. In 1906 these powers were given to the high commissioner. The main task of this administration was to settle the concessions question, which was achieved in 1907 by the issue of a proclamation under which land and grazing concessions suffered a deduction of one-third of their area for the sole and exclusive use and occupation of the Swazi

Population .- The African population in 1946 was 181,269, an increase of 64.3% since 1921. The European population, which in 1921 was 2,205, had risen to 3,201 in 1946, and in the same neriod the coloured or mixed population rose from 451 to 745 There are European villages at Mbabane, the administrative capital, and Bremersdorp, with European populations of between 500 and 600, and there are smaller villages at Emlembe, Piggs Peak, Goedgegun, Hlatikulu, Mankaiana and Stegi

Religion .- Apart from indigenous religions, Christianity alone is

represented by 23 denominations.

Education.—There were, in the early 1950s, four government Education.—There were, in the early 1950s, four government primary schools for Europeans, one government secondary school and two other secondary schools run by voluntary agencies. The total entolment of European children in 1951 was 705. There were 8 government primary schools for Africans, 8 tubal schools, 3 national schools ment primary schools for Africans, 8 tribal schools, 3 national schools anniatizated from a special fund and 194 mission schools (of which 97 are special manufactured). The food aeroniement 1951 was 18,454. There are government-aided, the total enrolment in 1951 was 18,454. There were specially the total enrolment in 1951 was 3071. These were two government and three mission hospitals in the territory. One of the latter was government-aided. There were also mine

government health centres

Administration.—In the United Kingdom responsibility for the administration of the territory rests with the secretary of state for commonwealth relations. A high commissioner has powers under the order in council of 1903 to administer and legislate for the territory, and he has similar powers in respect of Basutoland and the Bechuanaland protectorate He resides, however, in the Umon of South Africa, where he is also high commissioner for the government of the United Kingdom In Swaziland and directly responsible for its administration Surgious in owacaniau and carecty responsible for its administration is a resident commissioner, who governs subject to the directions of the high commissioner under powers vested in him by proclamation and bits commission. He has a staff of administrative, technical and subordinate officials, and, in respect of European affairs, is assisted by an advisory council, first established in 1921, of ten elected Europeans. A advisory council, first established in 1921, of ten elected Europeans system of administration was set up in 1950 by proclamation which provided for the administration of the Swazi by their paramount and other chiefs together with their councils in close conformity with

provided nor the seminationaries or the Swat by their parameters are the control in the control in close conformity with tention of the control in the contr the end of the 19th century by the then paramount chief Mbandeni.

Livestock raising is practised by Europeans and nearly all Swari.

In 1951 there were 327,964 African-owned cattle, 7,536 owned by coloured persons and 73,733 by Europeans.

The staple diet of the Swazi is maize. They also grow sorghums which are usually converted into beer. Other crops are peanuts, tobacco, beans and lice Tung trees do well, as do citrus, avocados and other subtropical fruits

subtropical routs
The principal exports are asbestos, live cattle, cotton, hides and
skins, butter, metallic tin and wattle bark Gold is mined on a small
scale and some barytes is produced. There are large unexploited coal
fields in the low veld
Communication.—There are no railways in the territory, but

510 mi of bus services are operated by the South African Railways administration

Finance.—A Swazi national treasury was established to handle the finances of the newly created native administration in 1950.

The main heads of taxation for 1050-51 were income tax (levied on non-Africans only) £234,205, customs and excise £68,657 (under an agreement with the Union of South Africa Swaziland receives a 0 149% share of the total collection of the Union), native tax £56,111, base metal royalties (chiefly from asbestos production) £29,207, total

page metal royalties (casely from assessos production) 1:29,397, total particular of the page of the page of the page of the Swari Antican Articlosacy: Rush Among the Swari Gafford, 1947). SWEARING. The common use of the word is for the uttering of profane oaths or curses. In English law, while blasphemy (q v.) was at common law an indictable offense, cursing or swearing was left to the ecclesiastical courts. The Profane Oaths act, 1745, inflicted a sliding scale of fines for the use of profane oaths according to the rank of the offender. is, for a common labourer, soldier or seaman, 25 for everyone below the rank of gentleman and 5s for those of or above that rank, procedure under this act is regulated by the Summary Turisdiction acts By the Town Police Clauses act, 1847, the use of profane or obscene language is an offense punishable on summary conviction by a fine not exceeding 40s or imprisonment not exceeding 14 days. The offense must be committed in a street. In the United States, blasphemy is a crime under either the common law or the statutes of substantially all of the states.

SWEATER, a jacket or short coat of a woollen material, usually knitted, and sometimes called a jersey, because it was worn by the sailors of the Island of Jersey The first sweaters were heavy, dark-blue jackets, which were pulled on over the head, and were worn by the participants in athletic contests before

and after games, to prevent cold.

SWEATING SICKNESS. A remarkable form of disease not known in England before, it attracted attention at the beginning of the reign of Henry VII It was known indeed a few days after the landing of Henry at Milford Haven on Aug 7, 1485, as there is clear evidence of its being spoken of before the battle of Bosworth on Aug 22. Soon after the arrival of Henry in London on Aug. 28 it broke out in the capital and caused great mortality. This alarming malady soon became known as the sweating sickness. It was regarded as being quite distinct from the plague, the pestilential fever or other epidemics previously known, not only by the special symptom which gave it its name. but also by its extremely rapid and fatal course.

After 1485 nothing more was heard of it until 1507, when the second outbreak occurred, which was much less fatal than the first. In 1517 there was a third and much more severe epidemic. In Oxford and Cambridge it was very fatal, as well as in other towns, where in some cases half the population were said to have perished There was evidence that the disease had spread to Calais and Antwerp, but with these exceptions it was confined to England

In 1528 the disease recurred for the fourth time and with great severity. It first showed itself in London at the end of May, and speedily spread over the whole of England, though not into Scotland or Ireland. In London the mortality was very great; the court was broken up, and Henry VIII left London, frequently changing his residence. The most remarkable fact about this epidemic is that it spread over the continent, suddenly appearing at Hamburg. and spreading so rapidly that in a few weeks more than a thousand persons died. Thus was the terrible sweating sickness started on a destructive course, during which it caused fearful mortality throughout eastern Europe. France, Italy and the southern countries were spared. It spread much in the same way as cholera,

passing, in one direction, from north to south, arrwing at Switzerland in December, in another northward to Demante, Sweden and Norway, also estiward to Lithuania, Poland and Riussia, and westward to Flanders and Holland, unless indeed the epidemic, which appeared simultaneously at Antiwerp and Amsterdam on the morning of Sept. 28, came from England direct. In each place which it affected it prevaled for a short time only—generally not more than a fortinght. By the end of the year it had entirely disappeared, except in eastern Switzerland, where it ingered into the next year, and the terrible "English sweat" has never appeared again, at least in the same form, on the continent

England was, however, destined to suffer from one more outbreak of the disease, which occurred in 1551, and with regard to this we have the advantage of an account by an eyewitness, the

physician John Kaye or Caius

The disease began suddenly with a sense of apprehension, followed by cold shivers (sometimes very violent), giddiness, headache and severe pains in the neck, shoulders and limbs, with great prostration. After the cold stage, which might last from half-an-hour to three hours, followed the stage of heat and sweating The characteristic sweat broke out suddenly, and, as it seemed to those accustomed to the disease, without any With the sweat, or after that was poured out, obvious cause came a sense of heat, and with this headache and delirium, rapid pulse and intense thirst Palpitation and pain in the heart were frequent symptoms. No eruption of any kind on the skin was generally observed, Caius makes no allusion to such a symptom. In the later stages there was either general prostration and collapse, or an irresistible tendency to sleep, which was thought to be fatal if the patient were permitted to give way to it The malady was remarkably rapid in its course, being sometimes fatal even in two or three hours, and some patients died in less than that time. Those who survived for 24 hours were considered safe

The disease, unlike the plague, was not especially fatal to the poor, but rather, as Caus affirmed, attacked the riches soft and those who were free livers according to the custom of England in those days "They which had this sweat sore with peril of death were either men of wealth, ease or welfare, or of the poorer sort, such as were idle persons, good ale drinkers and tuverne haunters."

Causes.—Some attributed the disease to the English climate, its mosture and its fogs, or to the intemperate habits of the English people, and to the frightful want of cleanliness in their houses and surroundings which was noticed by Erasmus in a well-known passage, and about which Caius was equally explicit. But it must be concluded that climate, season and manner of life were not adequate, either separately or collectively, to produce the disease, though each may have acted sometimes as a predisposing cause. The sweating suckness was in fact, to use modern language, a specific infective disease in the same sense as plague, typhus, scarlet fever or malara.

The only modern disease tesembing sweating sickness is that known as mitary four "Gischweisfriest," sixtet mulitate" or the "Ficardy sweat"), a malady which has been observed in France, Italy and southern Germany, but not in the United Kingdom. It occurs in limited epidemics, not lasting more than a week or two (at least in an intense form). The attack last longer than the sweating sickness, is accompanied by eruption of vesicles and is not usually fatal. The first clearly described epidemic was in 1713 (though probably it easted before) and the last in 361. Better these dates about 175 epidemic laws been counted in 361.

Historical Fabiology, tans by Cenghion (New 194, Sec., 1885).

SWEATING SYSTEM, a term used to describe oppressive industrial conditions in certain trades. The word sweater was used in England as early as 1850 to describe an employer or middleman who exacted monotonous work at very low wages. Charles Kingsley in his novel Alton Locke (1850) and his political pamphilets directed attention to London "sweaters"; and Henry Mayhew in 1851 talked of "the sweating system".

The system can be traced in certain trades in most countries both misde and outside Europe. It is closely associated with contracting Individual workers or groups of workers contract to do a certain pilo for a certain pilo Economic step they carry out this contract themselves, in other cases they left it out again to subcontractors at lower prices. Contracting makes possible labour exploitation, often of women and children; and it produces erratic employment. When trade is brisk extremely long hours are worked in seriously overcrowded works own or dwelling houses. When it may be a subsection of the state of the contraction of the state of the contraction of the contract

Contracting and subcontracting are common in the garment manufacturing industry. In the right century outwork existed in other industries, such as boot-and-shoe manufacture and soap-making. Although legislation had by the middle of the 20th century either eliminated or carefully controlled sweating in most highly developed countries, the system was still operating in many Assauce countries where larger numbers of people were engaged in home work than in industrial establishments.

Conditions tend to be worse in large cities, where sweatshops are hidden away in slum areas. They are aggravated by millium of cheep labour from outside. To the native poor engaged in tailoring in li London in the 1880s was added a large minigant labour cof of unskilled foreigners. In the United States the tireless search for cheen labour encouraged such immirration until 1017.

The first large-scale official inquiry into the sweating system was carried out by a select committee of the house of lords in England Its report, published in 1890, described conditions in tailoring, bootmaking, furriery, shirt making, mantle making, cabinetmaking, cutlery and hardware manufacture, chanmaking and nail making, saddlery and hardware manufacture, chanmaking and nail making, saddlery and hardware manufacture, chanmaking and mall making, and deck labour. It daimed that sweating involved (1) a rate line of the state of t

Like Inquiry of the select commutee did not bear fruit immediately. It was not until 1900 that the Trade Boards act set up boards to fix minimum wages in specified industries such as mechane-made lace manufacture and chummadang. In 1918 the scope of the act was extended to cover any trade where the ministry of labour considered that machinery for the effective regulations of wages was inadequate. Government interference was important, chiefly because it permitted the development of collective bargaining. By 1939, though many workers still received low wages, these were no longer any swated trades in Great Britain

In the United States most of the pressure to eliminate sweating was applied by organused labour. A number of acts, culmmating in 1882, prohibited Chanese immigration. The first minimum-wage law was passed in Massachusstism 1172 Numerous state laws improving factory and outwork conditions followed, and by 1039 practically all states had limited the hours of labour for women, and several had introduced legislation prohibiting might

Four main factors contributed in other countries as well as in Great Bratian and in the Unated States to the control of sweated industries: (1) social idealism; (2) the pressure of trade unions; (3) the extension of the franchise and the growth of abour parties; and (4) the growing economies of factory production and the increased interest in human relations in industry. In 1928 the International Labour organization carried a recommendation concerning minimum-wage fixing that gave home workers and others subject to contracting and subcontracting some measure of protec-

tion; and further action was mooted after World War II.

#### UNITED STATES

The sweating system grew in the United States during the Civil War, when soldiers' wives were employed to make uniforms with the relatively newly developed sewing machines. Its advance was slow, however, until the 1880s, when immigrants from eastern and southern Europe provided a large source of cheap labour At that time the conditions necessary for a sweating system existed, a mass of unskilled, unorganized poverty-stricken men, women and children incapable of resisting the economic pressure to compete for work-women against their husbands, children against their parents: power-using factories or shops, where materials could be prepared for simple processes done in smaller shops or in the homes of workers or both; and mechanized transportation to and from the sweatshops and tenement dwellings, eliminating the long journeys on foot by heavily laden men, women and children. Motor trucks and the parcel post contributed to widen enormously the area within which the sweating system could be carried on

As the first sample foot-powered sewing machines brought the sweating system to the soldiers' families, so the ceaseless evolution of the power-driven machines, first steam, later electric, served to concentrate the production of garments in vast skyscrapers near railway stations to which the employees travelled from their widely dispersed homes. That concentration facilitated labour organiza-

tion within the garment industry.

Sweatung-system evils also prevailed in other U.S. Industries based on small workshops, homework and cheap labour, such as the making of cigais and artificial flowers. Inside and outside the garment industry the unions strove ceaselessly against sweating. In 1889 the tobacco workers obtained the passage of a New York statute forbidding all manufacture of tobacco in any tenement house, but it was held unconstitutional by the New York court of appeals and homework was prolonged for a number of years. The US department of labour and various organizations, such as the National Consumers' league, also participated in the movement against the sweating system, and by the 1930s the conditions which had made it possible in the clothing industry had been virtually eliminated

Beginning in 1912 in Massachusetts, a number of states passed have creating minimum wage boards or commissions. The U.S. supreme court, however, in Adhins v. Children's Hospital (63 U.S. 525, 1934) held that a U.S. statute authorating a wage board in the District of Columbia to fix minimum wages of women and minors violated the guarantees of the due process clause of the fifth amendment of the U.S. constitution, since freedom to contact between the employer and employee was impaired. The tract between the employer and employee was impaired. The Coatt Hatel Co. v. Perrith (100 U.S. 370) decision. Many states passed minimum wage laws, and in 1938 a Federal Fair Labor Standards act covering industries engaged in interstate commerce was enacted.

SWEDEN (SURKER), a kingdom of northern Europe, occupying a part of the Scandinavian peninsula. The length is about 990 mi, the extreme breadth (maintaind) about 290 mi, and the total area, inclusive of inland waters, of which the four great southern lakes comples 3,953 cqmi, is estimated at 173,435 sqmi. I. A. Streibitsky estimated the boundary at 6,100 mi; 4,1737 mi, are coastal, the Nowegeian frontier is 1,250 mi and the Finnish

333 ml.

Physical Features.—The backbone of Sweden is an ancient mountain range of which the crest line forms the Norwegian boundary. The three man territorial divisions of Sweden are Nortland, Swealand and Gotaland. The country may be described in four mam physical divisions: the northern mountains and lake region district, covering all Norrland and the western part of Svealand, the divisional of contral Sweden; the Smilandi highlands, in the south and southeast; and the plains of Skane, occupying the extreme south of the penishal. The first district is much the largest and highest and contains the finest scenery. The greatest hegists lie along the boundary, and several exceed Gooo ft. Kebheights lie along the boundary, and several exceed Gooo ft. Kebheights lie along the boundary, and several exceed Gooo ft. Kebheights lie along the boundary, and several exceed Gooo ft. Kebheights lie along the boundary, and several exceed Gooo ft. Kebheights lie along the boundary, and several exceed Gooo ft. Keb-

nekaise (6,965 ft ) in northern Lapland, the highest point in Sweden, is a bold, somewhat isolated summit Slightly south, beyond the Lule alv, is a lofty mass in which Sarektjakko, the second highest summit, is situated. Still farther south is the betterknown Sulitjelma (6,279 ft ); beyond is a progressive decrease in height southward until Areskutan (4,656 ft.) is reached. Near the southern flanks of Areskutan the railway from Trondheim, Nor., crosses into Sweden. South of the railway the highland line passes into Norway, but before doing so the mass rises into such heights as Helagsfjall (5,892 ft ). There the snow line, which is about 3,000 ft in the north, rises to 5,500 ft. The numerous rivers are linked with long, narrow, high-level (900-1,300 ft) lakes, due mainly to dams of moraine. Among European countries only Finland exceeds Sweden in the number of its lakes. In Sweden the 96,000 lakes cover about 9% of the country, but the largest he in the central lowlands. The northern rivers run through forests and enter the sea usually through long estuaries. The Torne, which, with its tributary the Muonio, forms the boundary with Finland, has a length of 354 mi and drains Tornetrask (124 sq mi.). Along and near to the shores of the lake the railway from Gallivare runs to Narvik, Nor. The Kalıx (269 m1), with numerous rapids, is paralleled by the Lule, whose main stream is 193 mi. One of its branches, the Stora Lule, drains the Langasjaur and Luletrask, which together have a length exceeding 50 mi but a total area of only 87 sq mi At the head of the Langasiaur is the Stora Sjofall (Great Lake falls; Lapp, Atna Muorki Kartje), 130 ft. In the southern mountain valleys of the region there are several beautiful falls, such as the Tannfors, not far from Areskutan. Still farther south of the Lule are the Pite river (228 mi) and the Skellefte (255 mi); the latter drains Horna van and Stora van (total area 163 sq mi.). Horna van is a straight and sombre trough, but Stora van and the intervening Uddiaur are broad and picturesquely studded with numerous islets The Ume (291 mi) with its tributary the Vindel, of almost equal length, drains several lakes, including Stor Uman (63 sq mi.). The further principal rivers of this region are the Angerman (270 mi.) with the magnificent Hallingsa fall within its drainage area, Indal (261 mi.) and Ljusnan (267 mi.). The Dal (320 mi.) embraces Lake Siljan (110 sq mi.). The Klar has its upper waters—the Faemund-in Norway and reaches Lake Vaner after a course of 228 mi. The Torne has a dramage area of nearly 15,500 sq mi , but the Angerman has the largest basin (more than 12,300 sq.mi.) of any river entirely in Sweden; the average for the other large

northern streams is less than 8,000 sq.mi.
The lowlands resemble the coastal belt. There are fertile plains
of clay, with innumerable lakes, including Vaner (Vener), Vatter
(Vetter), Malar and Hjalmar, with areas respectively 2,145, 733,
440 and 189 sq.mi.; the Vaner is the largest lake in western Europe.
The scenery of the lake distruct is quietly beautiful.

Granulite, also called curite and hallefinita, is the most important of the Archaean formations and contains all the metalliferous deposits of Sweden. The rock is a very compact and fine-grained mixture of feldspar, quartz and mica, often grading into mica schist, quurattie and gueiss. The Cambrian and Ordovician strata occur in isolated patches. The deposits in most places are very little disturbed and form horizontal or slightly inclined layers. South of Vaner they are capped by thick beds of cruptive disbase Conspicuous local features are the eskers or gravel ridges (asar), 100 to 200 ft. in helght, in direction north-northwest. Their practical value lies in their excellent water supply and gravel.

South of the central lowlands the Smaland highlands lie in the heart of Gotaland and are a detached part of highland Sweden. They lie roughly south of Vatter and reach the southwest coast. The general elevation of this region exceeds 300 ft. and in the eastern part 600 ft.; the principal heights are Tomtebacken (7,237 ft.) and Galtasen (7,185 feet). There is much conferous forest, but agriculture is profitable. The Smaland highlands abut southward upon the plains of Skane. Newer rocks of Cretaceous and Jurassic Ages, together with Recent marine deposits, have yielded level plains, with rich open meadows and cultivated lands, the monotony of which is in some parts relieved by beech woods. The Triansic formation (Ranett') in the northern part of Malmohus consists of

sandstones and clay beds with coal

On the whole the rivers of south Sweden are few and short. Lake Vaner is drained to the Kattegat (Cattegat) by the short Gota river, on which, near the lake, are the celebrated falls of Trollhattan.

Coast.—The coast of Sweden, though not indented with so many or so deep fixed as that of Norway, yet resembles it in having a fringe of islands which, throughout large parts of its length, shelters the coast of the mainland from the open sea. This skargard is interrupted only round the southern shore off Skane.

The island belt is widest (45 m) of the city of Stockholm (noted for its beautiful sea approach). Farther north, only the narrow Alands Hav lies between the Swedsh coast and the yest Aland archipelage, which extends to Finland. The thergord islands as a whole are rugged and picturesque, in the Baltic several are well wooded, but the majority, particularly in the Gulf of Bothma, are bare or heath-clad. For the large islands Oland and Gotland see securate articles.

Climate.—Several factors contribute toward variations of climate in Sweden's several regions. The land runs through more than 132° of latitude; about 15% of its area is within the Arctic circle; the boundary mountains are sufficiently high to be much colder than the adjacent coastal lands, but are not high enough to shut out entirely the warming effects of those drifts of wind and water from the southwest which give Norway is remarkable chmate, the eastern and southern borders are washed by the sea: the piercing winter winds from the great Russian pool of cooled atmosphere can sweep westward over the Swedish lowlands or can reach the mountain tops which, on the whole, offer but moderate gradients for ascents February is the coldest month and has a mean temperature of below 32° F. over Sweden Stockholm averages 25.7°, Goteborg 30 4°, Haparanda 10.6°, but the coldest region is in the heart of Lapland, there the average for Karesuando is 5.2°. In some northern parts frost occurs in every month of the year, and at Karesuando only five months have a mean temperature above freezing point. July is generally the warmest month. Goteborg has a July mean of 62 2°, Stockholm 62°, Haparanda 59° and Karesuando 54 2°. The summer is short but high maximums are sometimes recorded, e g, 88° at Karasjok in Lapland

The relative length of the seasons shows contrasts resembling those of temperature At Karesuando the last day-frost of spring occurs on an average on June 15 and the first of autumn on Aug. 27. while at Stockholm four and a half months, and at Hyen in the sound more than six months are frostless. Ice forms in October in the north and breaks up in May or June, while in the midlands and south the corresponding months are late November and April. The ice covering of the lakes ranges from 100 days annually in the south to around 200 days in the north, though local increases of the ice period occur in the upper Smaland highlands. Drifting sea ice generally appears in the Kattegat in January, but the sound becomes obstructed later largely by drift ice from the Baltic. In exceptional winters (e.g., 1941, 1942) the sound may be com-pletely frozen over. Ice conditions in the Baltic vary considerably from year to year but usually navigation in the southern part of the Gulf of Bothnia is impeded from the end of November to the beginning of May; in the north the gulf is covered with ice from November to mid-May, and among the islands it may linger until

The length of the Swedish summer day varies between wide limits At Karesundon in 85° 86′ 11, lat the unit so continuously above the honzon from May 86 to July 18; at Haparanda it may be seen for 32 hours and at Land for 17½ hours at the summer solstice. Refraction increases the average length of the day by 30 min. in the north and by 15 min, in the south. More important is the effect of twilght, which results in daylight's lasting without interruption from June 50 to 72 as far south as Harmosand (65° 38° N.)

The average annual rainfall for Sweden increases, on the whole, from north to south, reaching a maximum toward the southwest. Thus the average in the north of Nornland is 16.5 in. and in the south it is 2.3, in. At Borns, midway between the south end of Lake Vatter and the Kattegat, the average is 35 in. 'The minimum et Karesuando is 12.3 in. The pend of maximum is generally the

Sto. 12

later half of the summer and the minimum Pebruary and March. The proportion of total precipitation which falls as now range from 56% in Lapland to 9% in Skane. Show lies 47 days on average on the planes of Skane, while in the noth it like from 140 to 100 days. The Swedish glacers cover about 135 sq mi. They occur in the northern highlands about Kebnekase, Sarekijakko and Sultjelma. The most southerly is on the slopes of Helagsfjall in lat. 65 \* 54.

Vegetation.—The extensive range of latitude and altitude produces many local vegetation differences. Four main regions can be distinguished, but they tend to grade into one anothes near their adjacent fringes. In descending order of altitude and, largely of latitude also are; (r) alpine regions, (2) a zone of birch woods, (3) a conferency forest region and (4) a bechwood region.

(3) a conterous lorest region and (4) a becknowed region. The alpine region occupies only the upper lanks of the spinal mountain range, at an altitude above 1,600 ft in the north and above 3,000 ft, in the south. The lower belt of this region consists of thickets formed by several species of shrubkle willows and dwarf brich, as well as of dwarf shrub communities and meadows With increasing altitude the dwarf shrub communities and meadows With increasing altitude the dwarf shrub communities and meadows With increasing altitude the dwarf shrub communities and a accompanied by grass heath types. The vegetation of calcareous ground of smuch richer in species than that of sluceous ground and comprises Lapps' rhododendron, tree nymph (Druaz) article poppy (rare), several characteristic species of sedges, saxifrages, whitlow grasses, etc. The higher tops of the mountains are characterised by a few flowering plants scattered in carpets of mosses and lichens, alternating with almost or, at the highest altitudes, even entirely naked soil.

The brich forests are much more extensive in the north, where they form a sublaine belt, separating the confierous forest renor from the alpine region. The dominant tree is the brich Betule lorateos, which grows together with rowan, brid cherry, some illows and aspen (which rarely attains tree size). The undergrowth is rich in herbis; e.g., wood crane's-bill, globellower, goldenrod, etc. In dry situations, on gravel, it is poorer, there behens, especially reindere "moss" and Nephroma arctice, are dominant.

The coniferous forests are the most extensive and cover nearly all the country northeast of Lake Vaner. The important tree on the direct and higher ground is the Scotch pane (Prints sylvestris), with cowherry in the undergrowth. More fertile soils are occupied by spruce (Pieca abies), having bilberry in the undergrowth. The conifers extend from sea level to 2,500 or 3,000 ft; and though the pine and spruce predominate yet there is a sprinkling of low-land birches, rowans and aspen in the north, while large numbers of such deciduous trees as oaks, ash, limes, maples and elms are found in the south, especially on fertile soil. These latter trees seldom extend beyond; 500 ft, above sea level, and the oak ceases about Lat. 6: 5° N. (coastal).

The beach forests (with occasional oak) are restricted to Skane. They are tending to be reduced by extended land cultivation. The flowering plants of southern and middle Sweden are largely imagnats since the last glacal epoch, and the number of species shows a decrease inorthward. Many plants in northern Sweden are considered to be glacal survivors.

Fauna.-The effects of the great latitudinal range of Sweden are also shown in the case of fauna. Some animals, such as the hare, vanous shrews, the ermine, the weasel, the squirrel, the fox and the elk, are common to the entire country. Formerly bounties were paid for the extermination of the larger animals, which were thus greatly reduced in number. The bear is now protected and, with the wolf, glutton or wolverine and lynx, is becoming restricted to the more solitary depths of the northern forests. The wild reindeer is extinct, but large domesticated herds form practically the sole source of livelihood of the Lapps. The elk is the most valuable game animal, but badgers, which exist in large numbers in the midland plains, otters and the rare pine martens of the coniferous forests are hunted for their skins. The roe deer is spread over the southern and central parts of the country with a tendency to spread northward. The arctic fox and the lemming are mountain animals the former being confined to the highlands of the north. When the lemmings make their nonperiodical migrations to the lowlands their vast hordes are the prey of bird, wild and domesticated animals. The common porpoise is the only cetacean occurring in the Baltic, and with the gray seal it is held to

be responsible for much damage to fisheries

Bird life 15 very abundant, especially in spring and summer; several types such as the teal, snipe, golden plover and wagtail are found throughout the country. In the northern mountains the ptarmigan is common; ducks and other waterfowl frequent the lakes both there and in the south, the golden eagle, certain buzzards, owls and the small Lapland bunting are found. In the coniferous forests, grouse, capercailzie and woodcock have long been the principal game birds but are now less common, the crane lives in marshy clearings, birds of prey, crows and many other passerines range over a wide area. In the midlands partridges and doves are fairly common. On the coast large numbers of gulls and terns are found, also the eider duck and the rare sea eagle There are very few reptiles or amphibians and the viper is the only poisonous species of snake. The rivers and lakes are generally well stocked with fish, such as salmon, trout, char, pike and perch. Both fresh-water and sea fisheries are important, especially on the west coast, where herring, cod, flatfish, mackerel and sprat are caught Great numbers of a small herring called stromming are fished in the Baltic together with cod, eel, salmon and flatfish the brackish waters of the east coast salt-water and fresh-water forms are found. The crayfish occurs in many places in central and southern Sweden. Pearls are at times found in a fresh-water mussel, and oysters are cultivated to a small extent on the west coast. Among the lower marine animals a few types of arctic origin are found, not only in the Baltic but even in lakes Vaner and Vatter, having survived the changes consequent on the separation of the Baltic sea and the Arctic ocean.

Insect fauna is 11ch, even in the north. In summer in the northem lowlands the gadfly is common enough to cause annoyance to the rendeer, which it drives to the upper pastures and snow fields See M. Zimmerman, Les Estais reandanters (Paris, 1913), vol. ili of Geographie sumwerselle, ed. bp. P. Vidal de la Blache and L. Gallois, C. A. M. Lindman, Svensk Fanerogamflora, 2nd ed. (Stockholm, 1926).

### HISTORY

The first historical notice relating to Sweden is found in Tacitus, Germane, ch. 44, in which we find the name of the chief people of the pennsula, the Swedes proper, Sulones (Old Norse, Svar; Swedish, Svear; Anglo-Saxon, Sweon), who eventually gave their name to the whole country. According to Tacitus they were governed by a king, whose power was absolute, and possessed a strong fleet which secured them from hostile incursions. Their original territories lay on both sides of Lake Makar, in the provinces later known as Uppland, Sodermanland and Vastmanland. Other early Roman writers, Mela and Plimy, mention the country. (See SCAN-DINAYLS CHILLAZION.)

The people next in importance to the Suiones in the peninsula (Swed., Golarz, ON., Goutart, A. S., Geatsa) are first mentioned by Plolemy (under the form "Goutar" for Gautoi). He puts them in the southern part of the country. Gotaland consisted of Vastergotland and Ostergotland divided from one another by Lake Vatter, together with Smaland. In early times Vastergotland seems to have been the most important; Varmland, the district to the nonth of Lake Vaner, and the whole of the country to the north of Sweland seem to have been of small importance. Jamtland was always considered a part of Norway. After the time of Plolemy we hear no more of Sweden until the 6th century, when a surprisingly full account of its peoples is given by the Golibi historian Jordanes. He speaks of trade in furs of arctic animals which were sold by merchant to merchant to merchand Rome.

For the same period information is to be found in the Anglo-Saxm poem Bewulf. The hero himself belonged to the Geatas (i.e., in all probability, Gotar), his mother being the daughter of their king Hrethell. Hactiven, Hrethel's son, is said to have perished in a disastrous battle against the Svear, but his fall was avenged by his brother Hygelac in a subsequent engagement in which the Swedish king Ongentheow was killed. This Hygelac is clearly identical with that Chochiliacus wrongly described as a

Danish king by Gregory of Tours (iii, 2) who died in battle with the Franks under Theodheeth about a D 300. About the time of Hygelac's death strife broke out in the royal family of the Swen, between Onels, the son and successor of Ongenthow, and Eanaumd and Eadgils, the sons of his brother Ohthere The latter fled for protection to the Gotar and the war which ensued cost the lives of Eanmund and of Heardred, the son and successor of Hygelac. According to the poem, Beowulf himself became king of the Gotar, but Beowulf's later history has a mythical character, and for three centuries after this time there is no reference to Swedshi affairs in English or other foreign authorities. The kingdom of the Gotar probably ended soon after the 6th century

At a later time the kings of Norway claimed descent from the ancient royal house of the Svear, and their traditions, though in great part mythical, prove at least its high antiquity. They trace its origin to the god Frey, son of Norör, who is said to have founded Upsala, the ancient capital of Sweden Among his descendants Athlis, the Eadgils of Beowulf, is a prominent figure, in general, the account given of him agrees with Beowulf.

Barly Kings.—Four generatons after Ahlile' time a king named Ingaldr was overthrown by a prince from Stane, called Ivarr Viötäömi His son Olafr Tretelgia withdrew to Varmland, which he brought into a state of cultivation, though he was subsequently sacrificed by his subjects in a time of famine. The sons of Olafr Tretelgia moved westward into Norway, and if we may trust later traditions Sweden passed out of their family The subsequent kings of Sweden are said to have been descended from Ivarr Viötäömi About 83 och emissionary bishop Ansgar made his way to Birca on Lake Malar. For more than a century after Ansgar's death no serious mission seems to have been attempted

During the 9th century extensive Scandinavian settlements were made on the east side of the Baltic. The famous expeditions of Rurik and Askold which resulted in the origin of the Russan monarchy appear to have taken place toward the middle of the century, but it is not possible to connect these names with any families known from Swedsh tradition. Many names in Russian chron.

icles seem to be Swedish.

The continuous history of Sweden begins in the early 10th century, when a king named Eric son of Emund was reigning at Uppsala. Before the end of the century his descendant Olaf Skottkonung had created what for the moment was the strongest kingdom in the north Under him Christianity was established in Sweden As a leading ally in a coalition which included Sweyn, king of Denmark, and Eric, jarl of Lade, he overthrew Olaf I Tryggvesson, king of Norway, and annexed for a time part of Trondheim and the district now called Bohuslan, which he handed over to Sweyn Jarl, brother of Eric Jarl, as a marriage portion for his daughter Holm-Several years later another Norwegian prince, Olaf II Haraldsson the Fat, returning to Norway as king, put an end to the Swedish and Danish supremacy and in 1015 forced Sweyn Jarl to leave the country An attempt to arrange an alliance between Olaf Skottkonung and Olaf Haraldsson (who married a Swedish princess) was unsuccessful, and their relations were still strained when the former died, probably in the winter of 1021-22.

Anund, his son, early in his reign allied himself with Olaf Haraldsson against Canute of Denmark, who had demanded the restitution of the rights possessed in Norway by his father, Sweyn. The allies took advantage of the Danish king's absence to harry his land. On his return an indecisive battle was fought at Helgi A, and Anund returned to Sweden Olaf was driven from Norway by the Danes, but in 1030 he raised a small army in Sweden only to meet his death at the battle of Stiklestad Anund, who died about 1050, according to Adam of Bremen, was succeeded by his brother Emund the Old, who had been previously passed over because his mother was unfree, the daughter of a Slav prince captured in war. This king had become a Christian, but soon quarrelled with Adalbert, archbishop of Bremen, and endeavoured to secure the independence of the Swedish church, which was not obtained for another century. Under Emund there was a rectification of boundaries which assigned Blekinge to Denmark.

With Emund's death in 1060, the old family of Swedish kings died out. He was succeeded by his son-in-law Steinkel, a noble of Vastergotland, who was warmly attached to the Christian religion, though he refused to destroy the old sanctuary of iods at Uppsala During his regin grants of land in Varmland made by the king to the Norse jarl Haakon Ivarsson led to a successful invasion of Gostaland by Harald III Hardraade of Norway Steinkel also had disputes with Denmark. His death in 1006 was followed by a civil war, and for the next 15 years the history of Sweden is very obscure In 1081 we find the sons of Steinkel, ling eand Haistan, regging Inge's attachment to Christianity caused him to be expelled after a short time by his brother-in-law Sweyn or Blotsweyn, so called from his revaval of the old scarifices, described by Adam of Bremen Sweyn retained the kingship for only three years before line returned and slew him.

Organization of the Kingdom.-Under Blotsweyn's grandson, King Sverker (1134-55), who permanently amalgamated the Swedes and Goths (each of the two nations supplying the common king alternately for the next 100 years), Sweden began to feel the advantage of a centralized monarchical government Eric IX (1150-60) organized the Swedish church on the model prevalent elsewhere and undertook a crusade against the heathen Finlanders, which marks the beginning of Sweden's overseas dominion Under Charles VII, the archbishopric of Uppsala was founded (1164). But the greatest mediaeval statesman of Sweden was Birger Tarl. of the powerful Folkungar family. He practically ruled the land from 1248 to 1266 He founded Stockholm, but he is best known as a legislator who prepared the way for the abolition of serfdom. The increased dignity which the royal power owed to Birger was still further extended by King Magnus Ladulas (1275-90). Both these rulers adopted the dangerous expedient of creating a number of almost independent duchies in Sweden, but the danger of weakening the realm by partition was averted, though not without violent complications. In 1319 the severed portions of Sweden were once more reunited. Meanwhile the political development of the state was steadily proceeding. The formation of separate orders, or estates, was pronounced by Magnus Ladulas, who extended the privileges of the clergy and founded a hereditary nobility (Ordinance of Alsno, 1280) In connection with this institution we now hear of a heavily armed cavalry as the kernel of the national army. The knights too became distinguishable from the higher nobility To this period belongs the rise of a prominent burgess class, as the towns began to acquire charters. At the end of the 13th century and the beginning of the 14th provincial codes of laws appeared and the king and his council executed legislative

Union of Kalmar, 1397,--The first union between Sweden and Norway occurred in 1319, when the three-year-old Magnus, son of the Swedish royal duke Eric and of the Norwegian princess Ingeborg, who had inherited the throne of Norway from his grandfather Haakon V, was in the same year elected king of Sweden (Convention of Oslo). A long minority weakened the royal influence in both countries, and Magnus lost both his kingdoms before his death. The Swedes, irritated by his misrule, superseded him by his nephew Albert of Mecklenburg (1365). In Sweden, however, Magnus' partialities and necessities had led directly to the rise of a powerful landed aristocracy and, indirectly, to the growth of popular liberties. Forced by the unruliness of the magnates to lean upon the middle classes, Magnus summoned in 1359 a primitive form of the riksdag, on which occasion representatives from the towns were invited to appear along with the nobles and clergy. His successor, Albert, was forced to go a step farther and, in 1371, to take the first coronation oath.

The Swedish nobles, however, remained dissatisfied with the rule of Albert of Mecklenburg. In 1388, therefore, they called in Margaret (q.0.), Valdemar IV Alterdag's daughter and successor on the Danish throne, who became queen of Sweden also in 1389, Norway was already united with Denmark, and Margaret's plan was to bring all the three kingdoms together into a single union under Denmark. An act of union was drawn up at Kalmar in 1397 but was not proceeded with as the queen was dissatisfied with some of its clauses. At the same time her relative Eric of Pomerania was elected future king of the three kingdoms Alter Margaret's death in 1412 be assumed the government and proceeded to try

to change Sweden into a vassal country with the help of a system of Danish bailiffs. The consequent oppression became so hard that the Swedish peasants rose in 1434 under the leadership of Engelbrekt Engelbrektsson, a noble from Bergslagen. The national movement spread swiftly and the Danish strongholds were conquered In the course of this fight for freedom Engelbrekt called together at Arboga, in Jan. 1435, the first riksdag in which nobles, priests, burghers and peasants were all represented. In 1436 Engelbiekt was murdered. For several decades a party in fayour of the union, made up of the more important nobles and the clericals, with Danish support, proceeded to contend against a national democratic party under native leaders taken from the nobles. Danish kings were on several occasions recognized as rightful sovereigns also of Sweden, among them, for instance, Christopher of Bavaria (1440-48), in whose reign there was enacted in 1442 a new general law which, with additions, held good until 1734, and Christian I (1457-64) In between, a Swedish nobleman, Karl Knutsson, was recognized king (as Charles VIII) during the years 1448-57, 1464-65 and 1467-70, being twice expelled and twice reinstated. During the years that followed no native-born sovereigns were set up against the Danish kings, but the national party was under the leadership of riksforestandare, or regents, in the persons of members of the Sture family. After riks forestandare Sten Sture the Elder (1470-97) came the Danish king Hans (1497-1501), then Sten Sture again, (1501-03), and then Svante Sture (1504-12) and Step Sture the Younger (1512-20). The times were troubled and there were continual struggles with the Danes. Many Germans lived in the towns. After a Swedish victory over the Danes at Brunkeberg in 1471 an old ordinance by which the Germans should have half the seats in the town councils was abolished. The country now became impoverished, but the national feeling grew stronger than ever, concurrently with a hatred of Denmark caused by Danish intrigues against Sweden. After 1512 the aristocracy, led by Erik Trolle, sought reconciliation with Denmark Things came to a climax when the Danish king Christian II conquered the country; and in 1520 Archbishop Gustaf Trolle, Erik's son, had the foremost men of the national party in Stockholm executed (the "Stockholm blood bath") Among noteworthy events in this period may be mentioned the founding of Sweden's first university in Uppsala in 1477.

Gustavus I Vasa.—The Standinavian union was represented by the Damsh king hvmg in Copenhagen. Denmark and Norway held the south, and foreign trade lay in the hands of the Hanseatic league. Sweden was a land of peasants, divided by provinces and inspired by all the local patriotism that troublous times evoke. Uppsala university had deteriorated, and the affars of the Catholic Church had long been neglected by the Holy See

A young Swedish nobleman, Gustavus (Gustat) Enksson Vass, who had been treacherously carried off to Demmark as hostage and prisoner, in 7579 made his secape to Lübeck, where he won good friends. At the end of May 1520 he landed again in Sweden near Kalmar and quickly learned of the massacre in Stockholm, in which his father and brother-in-aw had persibed. He made his way up to Dalecarlis, where he raised his first peasant troops. He had neither arms nor money, but one province after another came to be supply to the complete of the compl

But it was not easy to guard what had been won. Lütheck had seemed for itself a monopoly of Sweden's foreign trade as well as exemption from tolls and bonds for very considerable sums in payment for services rendered. Drastic taxation had to be imposed, and the churches and monasteries also were requisitioned for help. Archbishop Gustaf Trolle was a fugitive, and the Swedish church found itself in a state of dissolution. Gustavus Vasa's first appeals to the pope were for bishops of Swedish birth, a new archbishop and church reformation. No favourable response came from Rome, and in these circumstances the king was influenced by Lutheras The New Testament was translated into Swedish. At the ribsdag help in Vasters in 1,027 the church settlement decreed

that the bishops had to hand over their castles to the king, and the chapters and canons, moreover, their superfluous incomes; that Peter's pence should no longer be paid to the pope; and that the pope's authority should not be invoked for the election of bishops. The year afterward the king was crowned in the cathedral of

Uppsala,

Gustavus Vasa had to defend the interests of the kingdom against the individual claims of the provinces. The peasants had become disturbed by the novelties of the Reformation, and an adventurer came upon the scene, declaring he was Sten Sture's son, Disturbances broke out but the king put them down with severity. Christian II had been driven out of Denmark also, and this produced a rapprochement between Sweden and Denmark Finally Christian was incarcerated in a Danish prison in 1532. Mean-In 1531 while, Lübeck's privileges had come to be intolerable. every church was called upon to hand over its largest bell to supply means for meeting the Lübeck habilities Lubeck declared war on Denmark and Sweden; with the help of German allies its forces took Copenhagen and Malmo. They could not hold out, however, and in 1536 peace was declared. In the following year a treaty was framed between Sweden and Lubeck regarding certain exemptions from tolls but without trade monopoly. Sweden's debts were declared to be settled.

King Gustavus had now to organize administration He heard talk about Roman law as the bass of all law. He consequently called in a great number of Germans, so that the years 1538-44 came to be known as the "German period", but the Germans were for the most part adventurers and the results were not satisfactory. The newcomers caused the king to distrust his earlher helpers. There was a dangerous outbreak in Smaland, led by a peasant, Null Dacke, who was killed in 1543. The influence of the Germans then cased, and Gustavus ruled alone He devoted great attention to mining, trade and agriculture An influential landed nobility was restrained At the riksdag meeting of 1560 the king presented his testament. He died on Spet 1.9 of that year, aged 46, second his devanement. He died on Spet 1.9 of that year, aged 48,

He was the founder of the new Sweden.

Eric XIV.—Custavus Vass' eddest son succeeded. Scholarly, display-loving, wayward, he ruled well at first but became insane. Gustavus had bestowed on his other sons dukedoms which entailed discords between them. On the occasion of his coronation Eric created the ranks of counts and barons, but he was mistrustful of the nobles, upon whom he imposed great exactions. He entered into negotiations for marriage with Queen Elizabeth I and afterward with Mary Stuart, as well as with two princesses on the continent, but met with refusals. Toward the close of his regni he married his low-born mistress, a good-hearted woman, Kann Mansodtter.

When the Teutonic Knights of Estonia and Livonia cassed to be, the town of Tallian and the neighbouring region went over of the own accord to Sweden. This was the first step toward a Swedish sovereignty over the Baltre south of the Bay of Finland. The situation pointed ominously to coming conflicts, for Russia took Narva, the Danish duke Magmus took Osel and Poland took a large

portion of the Teutonic Knights' country.

A break with Poland resulted in internal dissensions, as Eric's brother John, who was duke of Finland, married Catherine, the sister of the Polish king Sigismund II, and as security for a loan to his brother-in-law got some Polish castles in Livonia. A brief civil war took place. Eric's troops took Abo, and John and Catherine were put in prison, after being tried and sentenced by the riksdag. Negotiations were entered into with Ivan IV the Terrible in Russia and ended with a proposal for a treaty containing the condition-a blot upon Eric's name-that Duke John's wife should be handed over to the tsar, evidently to be used as a means of enforcing concessions from the Polish king. The shameful clause may be ascribed to Eric's madness, and it was never enforced. A severe conflict ensued with Denmark, which wished to have the union preserved and kept Sweden's "three crowns" in its coat of arms. Eric wanted to break the cordon in the south and would not recognize Denmark's claims to supremacy over the Baltic He ostentatiously added the Danish and Norwegian kingdoms' arms to his own. Other disputes followed, and war resulted

in 1563. The Swedish fleet won victories but the Danes had the mastery in the war on land, which was waged on both sides with grim ferocity. Lubeck and Poland allied themselves with Denmark. In 1569 Erick insurity became manifest. He had some of the foremost nobles imprisoned, murdered one of them himself and had others of them assassinated. He became penitent and set free Duke John, who, in alliance with his younger brother Charles and the nobles, dethroned and imprisoned Etic in 1568. He ducid in prison in 1579.

John III .- John, an amiable man, learned in theology but irresolute and weak, was acclaimed king. The Danish war died a natural death through the economic attrition of both powers and in Dec 1570 peace was declared at Stettin through Polish and French mediation, the frontiers remained the same as before the war Gotland was allotted to Denmark: Alvsborg on the west coast was to be surrendered by Sweden with a large sum of money, the question of the three crowns was left for later decision, but in the meantime Denmark was free to incorporate them in its arms, the Danish and Norwegian arms were to be taken out of the Swedish coat of arms. Sweden's gain consisted in the fact that from this time forward it was to be considered Denmark's equal as a Baltic state Between Sweden and Poland good relations sprang up at once, but war broke out with Russia, waged with changing fortunes and occasionally interrupted by armistices As a result the whole of Estonia, with Narva, was incorporated with Sweden.

The great religious struggle in Europe was followed with interest by John, who sought to take up a mediative role and entered into negotiations with the pone Both panal and Spanish envoys came to Sweden, and it looked as though the king would go over to the Catholic Church, but when the pope refused to accept his offer of mediation he changed his tone and entered into definite opposition to Rome. He had previously given out a liturgy which evoked general displeasure in Sweden by its approach to the Catholic form of religious services; taken as a whole, his religious measures caused great unrest His son Sigismund adopted the Catholic faith and was elected king of Poland in 1587. The internal administration of the country was marked by continual lack of funds (despite high taxation) and at the same time by extravagance over new buildings. Falls in the currency made the financial situation worse. The nobles were rewarded by special privileges for their part in the overthrow of Eric-a departure from the more democratic policy of Gustavus and Eric. The nobles now showed a tendency to aggrandize their powers, but the peasants never became serfs and the riksdag of the four estates continued to be called together. There were serious complications when John died

in 1592.

Charles IX.—The crown went to Sigismund, who was scantily gifted, obstinate and a devoted servant of the Cathole Church; list uncle Charles on the other hand was a practical man of affairs, passionate and hard. The evangelical learning had taken still stronger root, and at a church meeting in Uppsala in 1593 it was decided to abide by the Holy Scriptures, the three great symbols and the unmodified Augsburg Confession. Silgismund was forced to agree. On the day previously, however, he had protested to the papal nuncio against the undertaking, and he considered himself entitled to disregard it. He returned to Foland in 1594. Duke Charles and the council soon fill out, with the result that the Charles and the council soon fill out, with the result that the Sigismund landed with a small Polish army, but he suffered default in 1590 to declare him delhoned. Charles took a sangunary revense. The cantive members of the countly were excent.

Duke Charles was not crowned until 1607. He simed at a monarchical-democratic conception of government. During the years 1501—93 the riksdag or other estates were convened 15 times; during Charles's much briefer reign, 1594—1611, they were called together 16 times. New church dissensions were caused by the fact that Charles cherashed Chiumstic ideas while the clergy and the people expressed themselves more and more strongly in favour of evangelical tenets. By the peace with Russia concluded at Teusina in 2595 Sweden's ownership of Estoma and Narva had been recognized, but the troubles in Russia evoked new conflicts.

EDEN 641

Swedish troops matched into Moscow, and the Russian crown war offered to one of Charles's sons Novgorod was conquered War with Poland was waged in Livonia, where the Poles won certain advantages without being able to turn them to account Beccuse of Charles's endeavour to extend the region of Finnmark up to the arctic under the rule of Sweden, and from other causes, war brooke out with Demmark in 1611 and Kalmar was taken by the Danes, When Charles died in 1611 he left to his son, Gustavus Adolphus, an inheritance of three unfinished wars.

Gustavus II Adolphus.—Gustavus Adolphus, born in 1504, was declared of age on his faither's death. He had been given a thorough classical education and spoke Latin and several modern languages. He was an organizer of great capacity both n military and in internal administration. His personal influence was attributable to a strong and good character and a clear and faraghted vision. In all his work he had assistance of extraordinary value from his chancellor of state Count Ared Densityers (1987).

The Danes were successful in the war and took the harbours on the west coast. Through the mediation of King James I of England peace was concluded in 1613. The peace conditions were hard. Alvsborg was to be handed back to Sweden in return for a purpent of 1,000,000 dalers within sax years; the Finnmark region was given to Denmark-Norway, and the right of the Dansh king to use the Swedish three crowns in his coast of arms was reconnized.

Sweden next desired peace and a fixed frontier with Russia. The war was continued until the conclusion of peace at Stolbova -also with King James's mediation-in 1617. Sweden won eastern Karelia and Ingermanland, whereby land connection was obtained between Finland and Estonia, but gave up Novgorod. During and after these wars a great task of organization was carried out in Sweden. The council acquired a stronger position as the fices were set up after the French-Burgundian model; a method of judicial procedure was instituted and courts of appeal were established The nobility was incorporated in the social system as officials of the government, and much was done to improve local administration. The king promised not to begin war or conclude peace or make a treaty with other powers without the sanction of the riksdag. The ransom of Alvsborg made heavy taxes necessary, and even so the town of Amsterdam had to help with a loan. The financing of the state and the raising of the loan were based in a high degree on the copper ore in the Falu mines. In Jan 1619 the ransom sum was paid and Alvsborg was returned to Sweden. Gustavus Adolphus endeavoured to promote commerce. New towns were founded, of which Goteborg on the west coast was the most prominent (1621). A source of future difficulties lay in the privileges of the nobles Their graduated freedom from taxes the reward of the servants of the state-was to diminish thereby the state's revenue from taxation; this danger, however, did not present itself until later. The nobility secured the stability which it needed through the founding of the riddarhus, or house of the nobles, in 1626, in which records were inscribed of the noble families. Higher education was furthered. The University of Uppsala got from the king in 1624 a great donation of lands. Great attention was given to the equipment of the army and navy. Relations with Poland were settled by armistices until the year 1617, when negotiations led to no result. Sigismund had never abandoned his claim to the Swedish crown and therein lay a menace for the future. Open war began again and Gustavus Adolphus took personal part in it. Livonia and Riga were conquered, and for several years the Swedes carried the war into Polish Prussia. Through the mediation of Brandenburg, France and England, a six years' truce was agreed to at Altmark in Sept. 1629; some Prussian seaports continued to be Swedish possessions, the Swedes retaining the right to levy tolls.

Meanwhile the great conflict that was to be known as the Thirty Years' War  $(q, \nu)$  had started within the German kingdom, and Sigismund's efforts were meancing to the religious peace of Sweden. The emperor's troops were sent to Prussia to help Poland. The royal houses of Sweden and Denmark were related to German princes who asked for help. Catholic France sought to check the emperor's mcreasing influence and negotiated with Sweden

and Denmark; the English government was working to the same end Christian IV of Denmark entered into the war but was completely defeated, and Wallenstein's imperial army took up its position on the Baltic. Wallenstein was made duke of Mecklenburg and imperial admiral over the Atlantic ocean and the Baltic; an imperial fleet was to be built. When Stralsund was threatened, Gustavus Adolphus sent help (1628), and after long and many deliberations with the council and the riksdag he made his way with 13,000 men to Pomerania in June 1630; he preferred to have Germany as his theatre of war rather than to await an attack in Sweden. When success attended his invasion of the country, France concluded a subsidiary treaty with him at Barwalde in Jan. 1631. The evangelical princes of Germany took up a dubious attitude at first, and the Swedes were blamed when they did not succeed in reheving the town of Magdeburg, which was taken by the imperial general Tilly. After various negotiations, a decisive victory was won at Breitenfeld in Sept. 1631.

A series of bulliant Swedish successes followed. Gustavus Adolphus held his court in Mainz and Frankfurt, crossed the river Lech and made has entry into Munich. The empeor had dismosed Wallenstein in 169,0 but now took him back into favour, and soon the latter was once again in the field with a strong army, and the brisk war which ensued led to the battle of Litten in which Gustavus Adolphus met his death on Nov. 16 (O. S. 6), 1630.

It may be thought a matter for wonder that Sweden, a country with a population relatively so small, should have been capable of so great a political and military expension as was shown in the Thirty Years' War. The explanation lies partly in an extmoordinary national effort to svert an imminent danger. Sweden's armies were made up also in an increasing degree of foreign mercenaries, Geman, English and Dutch. In the Polish war a number of excellent Swedish generals had learned their business, and Gustavus Adolbubus was one of the foremost military leaders of the time.

Christina.—The death of Gustavus Adolphus produced a crisis in Germany. His daughter Christina, still a minor, was recognized as queen (1632-54) and the regency was undertaken by Axel Oxenstjerna. It was well that a new treaty was concluded with France in 1633 and that Wallenstein was murdered in Feb 1634, but in the autumn the Swedes suffered a defeat at Nordlingen which lowered their prestige. In 1635 Saxony concluded peace with the emperor, and its example was followed by Brandenburg in 1636; both declared war against Sweden. Johan Banér (q.v.) restored the good name of the Swedish troops by victories at Wittstock in 1636 and Chemnitz in 1639. His successor, Lennart Torstensson (q v.), thrice invaded the emperor's dominions and won the second battle of Breitenfeld in 1642. Almost everywhere Swedish interests were opposed by Denmark. Torstensson was ordered, therefore, to leave Bohemia for Denmark in 1643, and Jutland was overrun by Swedish troops. Christian IV was forced to conclude a peace at Bromsebro in 1645 by which Sweden won Jamtland, Harjedalen, Gotland, Osel and, for 30 years, Halland; exemption from the Oresund tolls was accorded for goods to Sweden and the Baltic provinces. By the treaty of Westphalia (see Westphalia, Peace of) Sweden acquired important German possessions—portions of Pomerania, Wismar, the bishoprics of Bremen and Verden as fiefs of the German empire, and prize money as rewards for the soldiers. A number of Swedes had in the course of the war amassed fortunes; the influence of the nobles in this way had been increased and a chasm had grown between them and the unprivileged classes. This was intensified by the circumstance that many foreigners had entered into Swedish service and had been rewarded with landed estates. Through them and through the impressions which Swedes had gathered in foreign countries, new ideas regarding the social status of the nobles had become prevalent.

The exercise of governmental power and the administration of the state in general were regulated by the constitution of the year 1634. Christina came of age in 1644, but laid down the crown ten years later. Richly endowed by nature, she had acquired much learning and many accomplishments but she was flightly and arbitarry, went to overload with gifts those who were momentanily 64.2 SWEDEN

in her favour. She went over to the Catholic church and died in Rome in 1680 after a life not lacking in excitement

Charles X Gustavus.—Her successor was Charles Gustavus, son of Charles IX's daughter Catherine, who had married John Casmir of Palatinate-Zwebrucken. He had been brought up in Sweden, becoming generalisations. The costs of the court were cut down, and in the rhsidag of 1655 the nobles agreed that the endowed estates necessary for administration of the kingdom, for defense of the realm and for working the mines should return to the crown, that certain estates bestowed as gifts should acquire the character of fiels with right of return to a new king, while a fourth of such estates as had been bestowed after the year 1625 forth of the control of

Charles X's short reign was occupied by war. With Poland there was as yet no peace, as the Russians had directed an attack against Poland, the king and the riksday decided to settle the matter by means of a war Charles X took Warsaw and Cracow (1655). Poland looked as though lost, but a national rising followed in favour of King John Casimir and two years of fruitless fighting resulted. Charles X qoncluded peace with the rising power, Brandenburg, and the Swedish and Brandenburgian armies together won a three days' battle at Warsaw in 1656. In that year the Russians began war and the emperor joined Sweden's enemies. and the following year Denmark, Holland and Brandenburg fol-lowed suit If all these powers could have co-operated closely Sweden's position would have been extremely perilous, but they could not Charles turned resolutely upon Denmark, took Jutland and led his troops first over the ice to Even and then across the islands to Sjalland The credit of this military exploit belongs chiefly to the quartermaster general of the army, Erik Dahlberg. Denmark was forced to make peace in 1658 at Roskilde, Sweden receiving Skane, Halland, Blekinge and Bornholm, Bohuslan and Trondheims Lan Both kingdoms undertook to make common cause to keep enemy fleets out of the sound. The king now thought of confronting his other enemies, but as certain negotiations with Denmark did not quite take the turn he expected and the Dutch were busily agitating in Denmark, he guessed that hostilities from this country would follow the moment he had become engaged in the east. He resolved to avoid this danger by completely crushing Denmark and began war anew in Aug 1658. His policy, however, failed, as in Poland, through a contingency with which the statesmen of those days seldom reckoned-the kindling of a national patriotic movement. Copenhagen withstood his attack and Holland sent a fleet which after a fierce struggle with the Swedes relieved the Danish capital. The situation was anxious, and a riksdag was called together at Goteborg. Charles X Gustavus died on the night of Feb 12-13, 1660, during its session

Charles XI,-Charles XI, a boy of four, succeeded his father as king at a moment when Sweden was surrounded by enemies The widowed queen and five officials became regent. The first thing done was to secure peace. with Poland, the emperor and Brandenburg at Oliva in 1660, whereby Sweden's right to hold Livonia was recognized and John Casimir renounced all claim to the Swedish throne, with Denmark the same year at Copenhagen, whereby Trondheims Lan and Bornholm went back to Denmark, compensation being given in the case of Bornholm; and with Russia in 1661 at Kardis, confirming the peace of Stolbova. Magnus Gabriel de la Gardie, the chancellor of state, was weak, and none took the lead in the way Axel Oxenstjerna had done after the death of Gustavus Adolphus The nation's defenses were allowed to decline although its foreign policy was adventurous. It was desired to obtain subsidies from other powers, and a rash treaty was concluded with France in 1672. In this year the king came of age, having reached his 17th year. His education had been neglected and he grew up awkward in his bearing, but he was an ardent patriot and extremely industrious.

The general decadence of Sweden became manifest when its foreign policy led to war with Brandenburg (1674) and Demark (1675). The war with Brandenburg was ill managed, and Sweden's military prestige was lowered by a defeat at Fehrbellin in

1675, most of its Geiman possessions were lost. The Danes invaded Skane where they continued to have many friends. The ling took the leadership. On the sea the Danes were successful, but Swedish victories at Lund in 1676 and other places saved the southern provinces. Peace treatise were signed in 1678 and 1679 with the different enemies. France accepted terms which in some respects were humilating for her ally Sweden. Some small regions in Germany were lost, but there was no question of any cession of land to Denmark.

Great portions of the country had been laid waste, the fleet had been destroyed, trade and commerce had suffered and finances were in disorder. A great task lay before the young king and he accomplished it, but it was by the methods of an absolute monarchy The riksdag was summoned several times-1680, 1682-83, 1686, etc .- but its attitude toward the king grew more and more complaisant and it gradually came to leave practically all matters of legislation and taxation to him. An inquiry was held into the conduct of the members of the regency, and they were sentenced to restore or pay large sums of money, a very drastic confiscation of private estates was taken in hand whereby land and incomes were made to fall to the treasury Charles then put the army and navy in good trim. The officers were remunerated by small farms; cavalry was raised by a certain number of assessed farms and the infantry by the landowners. In the year 1681 the Swedish national debt amounted to 44,000,000 dalers in silver, but on Charles's death it was only 11,500,000 dalers married the Danish princess Ulrica Leonora, but the two northern states soon fell apart again In 1681 Sweden entered into treaties with Holland at The Hague with a view to safeguarding the frontiers fixed by the peace treaties of Westphalia and Nilmegen The emperor gave his signature to the compact the following year Sweden wanted to draw Holstein into its sphere of interest so as to secure less interrupted communications between its different German possessions, Charles therefore gave what support he could to his maternal uncle Christian Albert, duke of Holstein-Gottorp, in his disputes with Denmark For Denmark, conversely, it was important to hinder the Holstein plans of expansion lest Denmark should be hemmed in on the south Charles XI died in April 1697, leaving one son, Charles, and two daughters.

Charles XII.—For the third time in the 17th century a regency was called on to act, but in Nov 169; the risking declared the 15-year-old Charles XII to be of age. At the coronation he placed the crown on his own head and gave no kinglorosaking (lindwise) with the coronation he placed the crown on his own head and gave no kinglorosaking (lindwise) "(sing's guarantee"). Charles was a gifted and precoccus youth who had been grounded in book learning and military science. He had high morality, but was inclined to obstinacy. In his early youth he was addicted to wild pranks and perflois sports. With three years of his accession, however, the Great Northern War (1700-or1) had broken out.

Poland, Denmark and Russia were united against Sweden. In March 1700 the Poles marched on Riga and the Danes against Holstein The young king showed unusual power and decision. Protected by the English and Dutch fleets he landed on Sialland (Zealand) and enforced on Denmark the peace of Traventhal in Aug 1700. In November the Swedes, under the personal leadership of Charles, won a momentous victory over the Russians at Narva In the summer of 1701 Charles marched south, drove the Russians and the Saxons over the Duna and invaded Poland Charles called upon the Poles to dethrone Augustus II the Strong who had begun the war. This stirred the national feeling of Poland and won Augustus help from other states. Charles's route went through Kaunas in Lithuania to Warsaw and Cracow which he took (1702). After continual but fruitless victories for the Swedes a Polish parliament, not constitutionally formed, declared Augustus dethroned and elected as his successor Stanislaus Leszczynski, a weak man who lacked the strength to defend his own The Polish parliament concluded peace with status as king. Sweden in 1705 In this way Poland became a kind of subject state to Sweden, but Charles miscalculated Sweden's capacity for maintaining such a relationship. During these Polish conflicts the tsar Peter took town after town in Livonia and Ingermanland, among them Dorpat and Narva. Charles, in the meantime, held

that the most important thing was to force Augustus to conclude peace before he took up his stand against Peter, and he carried war into Saxony The Swedish army was now one of the most famous in Europe, and Charles's power was very great. Leipzig was taken, and Augustus, by the peace signed for him by his ministers at Altranstadt in Sept 1706 and ratified by him in October, renounced the Polish throne and allowed Charles to remain some time in Saxony with his army. Augustus sought by intrigue to overrule the peace treaties but had to reaffirm them in Jan 1707 From different quarters came efforts to benefit by Swedish aid nearly a dozen German princes sought Charles out, and he was visited by 30 envoys from various courts. The most notable of them was the duke of Marlborough, who took note that the Swedish king did not intend to place himself on the side of France in the War of the Spanish Succession as rumour had declared Quarrels with the emperor began, but with the help of English and Dutch mediation a peace was concluded in 1707 which secured for Protestants in Schleswig the church rights promised them in the peace of Westphalia

Charles was anxious to come to conclusions with Russia, but he had given the tsar too long to prepare. The Russians had forced their way into Poland but were driven out again, and after a victory at Holowczyn (July 1708) Charles crossed the Dnieper. Adam Ludwig Levenhaupt was to have come with an army from Livonia to his support but was delayed and experienced a severe defeat, arriving eventually with a diminished force and without commissariat Devastations by the Russians made it difficult for the Swedes to provide themselves with necessaries, and when the Cossack Ivan Mazepa-Koledinsky offered his co-operation Charles concluded a treaty with him in Oct 1708 Mazepa did not manage to get his Cossacks to join with him, but Charles advanced into the Ukraine. In an unusually hard winter thousands of Swedish soldiers perished Charles began to lay siege to Poltava, the battle which followed (June 28, 1709) ended in a Swedish defeat, largely because of the fact that Charles was wounded in the foot and that his generals were not united. Charles made his way as a fugitive to Turkey and his proud army capitulated at Perevolochna on July 1, 1709

The unfortunate Russian campaign made an immense impression both in Sweden and in other countries Augustus declared the peace with Sweden invalid and marched into Poland The Danes crossed the sound and sought to overrun Skane. The government in Stockholm put forth all its powers to defend southern Sweden, and Magnus Stenbock won a decisive victory at Helsingborg in Feb 1710. The Danish troops were taken back to Denmark. The Russians occupied the Baltic provinces completely after they had taken Riga Meanwhile Charles was busying himself in Bender trying eagerly to bring about a war between the Turks and Russia. His stay in Turkey is difficult to explain; probably he did not want to return until the Russians had been either conquered or weakened. Thrice the Turks began war but without any gain to Sweden Meanwhile Stenbock made his way to Germany, but though he defeated the Danes, who had overrun Bremen and Verden, at Gadebusch (1712) he was forced to capitulate with his army at Tonningen in 1713. The Russians and Saxons failed to

From Feb 1713 Charles was held captive by the Turks, but after a swift journey he arrived at Stralsund in Nov 1714. The country was in a sad plight. The population was only 1.250,000 and the burden of the great war was too heavy. The people were oppressed by heavy taxes and services imposed by the state and worn out by consecution.

take Stralsund, but in 1713-14 the Russians swarmed over Fin-

land.

During the years that followed Charles XII strengthened Swedne's defenses against the Danes, who received help from a Kussian army and threatened an invasion of Sweden. The plan was not carried out, and Charles turned toward Notway to force the Danish king to make peace. While there he was killed by a bullet on Dec 11 (10.S. Nov. 30), 1718.

In Stralsund Charles had made acquaintance with the Holstein baron von Gortz, who afterward became his confidant and associate. Unscrupulous and resourceful, Görtz discovered new means

of taxation, simplified the state administration, lowered the value of the currency and conducted an adventurous policy abroad the poverty thus brought about evoked a hatted against him which after Charles's death led to his being their dand executed. With Charles the Swedish supremacy over the Ballic came to an end Swedish forces were withdrawn at once from Norway, one brigade which was sent against Trondheim expeniencing terrible losses in the mountains. The riksdag assembled for the special purpose of putting an end to the absolute power of the sovereign

Ulrica Leonora.-Charles's sister, the younger Ulrica Leonora, married to Frederick of Hesse-Cassel, was declared not to be the successor to the throne but was elected queen (1718-20) on condition that the riksdag alone should have the right to draw up the constitution. The changes effected in the constitution drawn up in 1719 and 1720 and in the riksdag decrees of 1723 were drastic. When the riksdag was not in session the council ruled together with the king who on most questions had only two votes. While the reksdag was sitting, decisions on foreign affairs and other matters were made by a secret committee which was formed of members of the three higher estates, the nobles, the clergy and the burghers The peasants were left in the background but they had to be heard on questions of taxation. Each estate chose its own speaker, in the house of nobles the speaker was called landmarskalk The membership of the council could be revoked only by law, and this made parliamentary government very primitive because it led to political lawsuits.

In 1710 peace was concluded with Hanower on the basis of sweden's giving up Bremen and Verden and rectiving a sum of money in return. In 1720 an arrangement was come to with Prass, which acquired a large part of Pomerana and also pead as sum of money. In 1720 also peace was made with Demark, which required a large part of Pomerana and also pead a sum of money. In 1720 also peace was made with Demark, which renounced the regions it had conquered in return for being a lowed to keep Schleswig. Russann fleets, however, were harrying the coasts of the Baltie, and an attack upon Stockholm was the great difficulty warded off. Peace was not concluded with Russia until 1721, at Nystad, when Sweden gave up Livona, Extona, lugna and parts of Finland, northern and western Finland was restored to Sweden.

Frederick I.—In 1720 the crown was transferred to the queen's consort Frederick I (1720-21). The leading statesman until the end of the 1730s was Count Arvid Hom, who pursued a pradent peace policy. The state's debts amounted to 60,000,000 or 70,000,000 silver dalers, and the emergency currency (nodmyntles) was wording much harm. A state bankruptcy was inevitable, and after this the emergency currency disappeared. With the English Navigation act as a model, a proclamation was issued in 1724 prohibiting foreign vessels from conveying to Sweden anything except the produce of the countries to which they belonged. The Swedis commercial fleet increased, an East Indian company was formed in 1731 (which caused bad blood in England), new manufactories were founded with support from the state, in particular the texture industry, thanks to Johns Alstromer, who created the manufactory at Alingsas. A new general law was framed in 1734. During the first vears following the neace of Nvstad Russis.

During the first years following the peace of Nystad Russis sought to intervene in Sweden's internal affairs. Horn therefore in 1760-77 made Sweden a member of the alliance between England, France and Prussus. Included, foregra subsidies began to have their ill effects in Sweden. Against Horn's prudent leadership there grew up an opposition which gained ground in 1734 and became victorious in the "histogia of 1738-39. Horn gave up office in the victorious party was called Hattar," the Hats' contradistion of the Victorious party was called Hattar, "the Hats' contradistion of the Table Sweden Provinces and power and a more intensity in the Sweden Provinces and power and a more intensity in houst stal policy, Sweden was to become a great power politically and economically.

The party of the Hats controlled the fortunes of the country until the 1760s, although sometimes strongly opposed by the Caps.

<sup>&</sup>quot;These party names originated in the Progressives' nicknaming their opponents—who sacrificed everything to perpetuate an inglorious peace—the "Nighteaps," they themselves receiving their name from the three-cornered hats that they wore as officers.

They dominated the council from 1739 onward with Count Karl side and it is calculated that these powers spent 3,000,000 silver Gyllenborg as their leader. Conditions seemed favourable for a war with Russia in 1741 and war began The campaign was badly conducted and the Swedish troops took to flight. Discontented thousands of peasants marched to Stockholm and could be dispersed only with difficulty At the beginning of the riksdag session in 1742 the Caps were in power, and the peasants now won for themselves a place in the secret committee. An inquiry was conducted into the actions of the instigators of the war, and two of the generals were condemned to death and executed The Hats now raised the question of the succession to the throne, the royal couple being childless, and the question soon became bound up with that of the Russian peace, as the Russian empress Elizabeth wished to see Duke Adolphus Frederick of Holstein elected The peasants particularly wanted to have the Danish crown prince, and a great conflict raged in riksdag circles, much bribing being done by foreigners In June 1743 peace was concluded at Abo. Russia retained only a small portion of its conquests in Finland, and Adolphus Frederick was chosen as heir to the Swedish throne. Denmark threatened war and Sweden's impotence became manifest when a Russian army came to the country to protect it against the Danes. While the rsksdag was in session there was a split among the Caps, and the council came to include both Hats and Caps. Adolphus Frederick came to Sweden and in 1744 married Ulrica (Ulrike; q v), sister of the Prussian king Frederick II. Russia's disposition to control the destinies of the country now took on a singularly offensive aspect. Foreign gold filled the coffers of the parties before the riksday of 1746-47 assembled. The Hats opposed the Russian proceedings resolutely and in this were supported by many of the Caps. Through new elections to the council, the Hats now came definitely into power again, with Count Anders Johan von Hopken as head of the government. Some members of the Caps party were charged with treason and the matter was investigated by a commission. This had the effect of diminishing their opposition to the Hats. An alliance was contracted in May 1747 with Prussia and France which improved the situation The successful party rewarded its friends lavishly and came down heavily upon its foes

The years which followed were comparatively quiet. The brilliant young noble Count Carl Gustaf Tessin was president of the council, which was the strongest known within the period of the riksdag's predominance, national defenses were strengthened, customs tolls were raised to help industry, which was also supported by loans and premiums; agriculture was supported also by loans on easy terms. The improvement secured by these measures was not entirely real, and great credits were extorted from the Riksbank, which had to increase its issue of notes. Notes depreciated in value and exchange offices were set up to keep the currency at the desired height.

Adolphus Frederick.—King Frederick died in 1751 and was succeeded by Adolphus Frederick (1751-71), who was under the influence of his stronger-minded wife. Controversial pamphlets and journals came out in numbers. Tension between the king and the council increased. A rash effort at a coup d'état was made during the riksdag of 1755-56; the royal couple was humiliated and an autograph stamp was introduced in order to dispense with the king's personal intervention in the government. Count Axel von Fersen came to the front as the foremost man in the Hats party; he was chosen as landmarskalk (see above), leading the bureaucracy of the nobles.

Opposition grew therefore among the unprivileged classes against the nobility and the bureaucracy. The state's finances were in a bad way, yet in spite of this the country was let in for a war, on the side of France and Austria, against Frederick II of Prussia (1757), largely because of the French subsidies. The war was badly managed, but peace was made with Prussia without loss of territory in May 1762. The Caps took office in the riksdag of 1765-66. Russia and Prussia together decided to support the Swedish constitution, to prolong its general state of weakness and at the same time to work against the French influence. A Russo-Danish alliance was also formed with the purpose of maintaining the Swedish constitution. England was on the same

dalers in order to ensure the victory of the Caps, while France's contribution to the Hats amounted to 2,000,000 dalers The corruption was shameful. Against the wishes of the royal couple. the crown prince Gustavus married the Danish princess Sophia Magdalena

The court had helped the Hats during the riksdag, and by the king's direct intervention the council was obliged to call together the riksdag which sat from 1760 till 1770. The Caps were now in a minority and their men were left out of the council which was controlled by the Hats. The court had been promised that the king's power would be increased, but the Hats did not keep their word. Nor did the riksdag succeed in solving the great financial problems In Feb 1771 Adolphus Frederick died Somewhat previously Russia and Denmark had come to an agreement that, should any change be made in the constitution of Sweden in the direction of increasing the king's power, they would uphold the existing constitution (Dec 1769) by force of arms. Sweden's constitution therefore seemed to be held in greater value by its enemies than by its own people

Gustavus III .- The crown prince was in Paris at the time of his father's death. He returned home to meet the riksdag. The Hats and the court party were receiving money from France, the Caps from Russia and England The parties were of about equal strength Gustavus now decided to precipitate a change of the constitution Col Jakob Magnus Sprengtporten crossed to Finland to stir up a rising, in which he succeeded but not so quickly as had been expected Johan Kristoffer Toll (a v ), a superintendent of forests, went to Skane and won over the garrison at Kristianstad Prince Charles, the brother of the king, also busied himself in Skane. The council got wind of the danger and the king had to act speedily On Aug 19, 1772, he collected around him the officers of the guard and arrested the council in the royal castle. The Stockholm troops declared for him and the people acclaimed him in the streets. The king became again head of the government, with the right to appoint officials. It was an attempt to divide the balance of power between the sovereign and the riksdag.

Russia and Denmark were furious but did not begin war, being much influenced by the resolute attitude of France. Gustavus surrounded himself with capable men He was unusually gifted, but too much of a visionary He had a real passion for the theatre but took up his business as king with honest intent; an inquiry into the conditions of governmental offices was initiated and a number of reforms in the administration were instituted as a result. In order to help the finances distilling was decreed a state monopoly and a number of distilleries were founded on behalf of the crown. This displeased the peasants, who wanted to be free to distil, and it increased drunkenness Another cause for dissatisfaction lay in the king's efforts to transform the nobility into a court nobility and to manage promotion so as to break the power of the old bureaucracy

A dispute with his mother discouraged the king, who next visited Italy and Paris; a subsidy treaty was concluded with France but Gustavus had no great success there. During the riksdag of 1786 the situation became worse; most of the king's measures were rejected.

Then Turkey's war with Russia in 1787 seemed to offer favourable conditions for a successful foreign policy. He began war with Russia in June 1788, taking command himself But the sea fight at Hogland was undecisive, and a conspiracy, known as the Anjala league, was formed by certain officers The conspirators opened negotiations with the Russian empress, to bring about peace. News came that Denmark had entered the war as Russia's ally, and Gustavus was obliged to hurry back to Sweden. The Swedish people became animated by patriotism and the king talked to the peasants as Gustavus Vasa had done of old England and Prussia brought pressure to bear on Denmark to leave Sweden in peace and a truce was concluded. By the beginning of the following year, 1789, Gustavus was strong enough to have the leaders of the Anjala league imprisoned. The riksdag was called together at the beginning of February. The meeting was

a stormy one, the kung, supported by the unprivileged extates, driving through the so-called Act of Union and Security, which embodied a number of far-reaching constitutional unnovations: the council cased to exist; the king acquired full powers over the administration of the state and the appointing of officials; and the rikized to its initiative in legislation. Once again the authority of the king became dominant. The rikized became responsible for the national debts, the management of which was placed in the hands of the rikized sixth emans and to issue credit notes. A number of the leaders of the oppositions of the rikized sixth emans and to issue credit notes. A number of the leaders of the opposition of the rikized sixth emans and to issue credit notes. A number of the leaders of the opposition being a second revolution. (See Gustavios III; Wakuyara, Olak)

The Russan war became a war of exhaustion on land During

Inter Aussian was bearing a water of the parts 739-90 there were several sea fights, the second of which, at Svensksund in 7990, constituted a fine victory under the king's command in Aug. 1790 peace was concluded without modification of frontiers. But Sweden's finances were destroyed and the internal strice brought to a head One result was a conspiracy against the king's life. He died on March 29, 1792, from the effects of a murderous attack by Cantain I. I. Anackarstrom at

a ball in the opera house on March 16, 1792

Gustavus IV .-- At the age of 13 Gustavus IV (1792-1809) became king of Sweden with his uncle Duke Charles as regent Duke Charles's closest associate was Baron Gustaf Adolf Reuterholm (q v), a man of great powers of work but pedantic and of little intelligence The regency brought order into the higher grades of government service and sought above all to further the prosperity of agriculture Reuterholm was not lacking in appreciation of the latest reforms, the freedom of the press was at first increased, but when the horrors of the French Revolution broke out it was restricted. The repute of the regency did not stand very high. It wavered between a French and a Russian alhance. The king, the duke and Reuterholm visited the Russian court in order to arrange a marriage between the king and a Russian princess, but the whole thing fell through when the king refused to give a guarantee of the princess's religious freedom. On the basis of a treaty concluded in 1794 between the two countries, the fleets of both Denmark and Sweden sought to protect neutral trade against privateers of England and other nations.

In 1796 Gustavus IV took the government into his own hands. He was scantily gifted but he knew how to make himself felt and combined obstinacy with passionate temper. So bad were the finances that the town of Wismar had to be mortgaged to Mecklenburg in 1801. In the course of a long journey in Germany in the years 1803-04 Gustavus came into touch with French émigrés, who inspired him with hatred of Napoleon He took part in the coalition against France in 1805-07, with the result that Pomerania and Stralsund were lost. In the treaty of Tilsit Napoleon and the emperor Alexander agreed to attack Sweden unless it declared war against England and prevailed on Denmark to do the same. The army in Finland gave way before the Russians. The strong fortress of Sveaborg was treacherously surrendered without any real struggle. In the spring the Swedes marched again to the south of Finland and won several victories, afterward immortalized by the poet J. L. Runeberg. In Dec. 1808 the Swedish forces evacuated Finland. Gustavus IV became more and more difficult and he annoved even England, his only ally. The feeling grew that the king must be dethroned. Gen, Georg Adlersparre started a revolutionary movement in Varmland, but before he reached Stockholm Adj. Gen. Karl Johan Adlercreutz had secured possession of the king's person (March 13, 1809). The king died in exile in 1837

Charles XIII.—The rikedag was called together on May 1 by the provisional government and it decided to draw up a new constitution and elect a king. The form of government which resulted was based on a division of power between the ministry, the representatives of the people and the judicature. The king was to be advised by a ministry the members of which were to be appointed by the king but to be answerable to the rikedag. General legislature was to be the work of the king and the rikedag, and the rike-

dag's control over taxation was confirmed. As soon as this constitution had been adopted Charles XIII was recognized as king (1809-18). The credit of drafting the new constitution belongs thefive to Hans Iarta.

King Charles was childless and it was necessary to choose a successor to the throne Public opinion in Sweden at this period occupied itself with Norway's union with Sweden as a compensation for Finland The rikking chose as successor to the throne Pinnee Christian Augusties of Augustenburg, who was commander under in Norway, manifestly in the hope that the choice would help to bring this union about. The prince declared that the could accept this offer only after a declaration of peace. During the late summer of 1800 the Russian war was extended to the north of Sweden and the Swedish forces met with two defeats. The Russians in the meantime had become weary of the war and no September peace was declared at Fredriksham (Hamlina); Sweden lost Finland and Aland. Soon treaties of peace followed with its other nemnies. Pomerama was returned to Sweden.

The heir to the throne, who took the name of Charles, died sud-donly in 18to, and a raksdag at Orehoo had again to deal with the question of a successor. Opinions were divided when a suggestion was made that they should elect one of Napoleon s marshals, Jean Bernadotte, prince of Ponte Corov It seemed certain that Napoleon would approve, and accordingly Bernadotte was chosen and assumed the name of Charles John, to become the founder of a new Swedish dynasty, the succession to the throne having been provided for in an ordinance passed in 18to. The old King Charles XIII had shown courage and patriotic feeling during Gustavus III's war with Kussa, but he was not very intelligent and he lacked strength of character. The crown prince therefore began to exert

In 1811 Napoleon prepared to break down Russia's resistance A great ware began, and the crown prince perceived that Sweden could not possibly go into it with France against England and Russia. He seems early to have thought out it is plans for the conquest of Norway, and in 1812 he brought about a complete change in Swedish policy with this goal in view. Napoleon's occupation of Swedish Pomerania without declaration of war facilitated this change, and Russia and England favoured the idea that Norway should pass over to Sweden from Napoleon's ally Denmark. After the defeat of the French armies in Russia Charlest John took pair the defeat of the French armies in Russia Charlest John took pair the defeat of the French armies in Russia Charlest John took pair the defeat of the French armies in Russia Charlest John took pair the defeat of the French armies in Russia Charlest John took pair the defeat of the prench armies in Russia Charlest John took pair the defeat of the prench armies in Russia Charlest John took pair the second of the Parkent Parken

The Norwegians themselves, desiring independence, held an assembly at Edsovld in May 18t, where they framed a constitution and elected the Danish prince Christian Frederick as king; but they were forced as the result of a short war to surrender. Christian Frederick laid down his crown and a storting endorsed the union with Sweden. Special conditions affecting the union were framed in the act of union or riksuke passed by the parliaments of both counties in 18t. 2001.

Charles XIV .- Bernadotte succeeded to the throne, as Charles XIV John, in 1818. The industrial economic revolution, evolving new classes which claimed their share in the government and burst asunder the old methods of representation, began in Sweden durmg his reign and embittered his later years. He was a strong personality, capable and lovable but distrustful of new ideas and apprehensive of too great changes. A liberal opposition was formed in the riksdag, above all among the burghers, and took a strong line against the government's repression of newspapers, against bureaucratic formalities and against the king's tendency to disregard the advice of his ministers From the 1830s onward there was a question of reform in the matter of the representation of the people, and a great many bills were put forward without accomplishing much. In 1840 the state council was changed by the creation of special departments. With the king's active cooperation the state's foreign debts were paid while internal debts were diminished, and in 1834 a regulation of the exchange was effected. Much was done for the canal system; one section of the Gotha canal was opened in 1822 and the rest of it in 1832. In 1842 the board school system was changed.

Oscar L.—Charles XIV was succeeded in 1844 by his son, a man of gifts and of more open mind but of less strength of will than his father. During the earlier years of his reign he stood for a policy of reform but later changed noticeably toward conservatism. During the last two years of his life he was ill, and the administration was taken in hand by his son Charles. The restrictions on agriculture and commerce were relaxed; the guild system was done away with in 1846; the old rules confining trade to the towns were removed. By decisions reached in the riksdag for 1844-45 the right to suppress newspapers was definitely abro-In 1847 an important poor-law system was introduced One of the greatest questions of that period was that of communication: railways had to be built, but there were differences of opinion as to the laying down of the main lines through the sparsely inhabited land. In the riksdag of 1853-54 it was decided that the main lines should be built by the state, and the direction of the work was placed in the hands of Col. Nils Ericson. Friends of reform concentrated more and more on the demand for a thoroughgoing change in the formation of the *riksdag*, and many proposals were submitted without any of them being accepted. The revolutionary movement which marked the year 1848 on the continent aroused feeling also in Sweden and some street disturbances occurred in Stockholm. The government produced a new scheme of representation, which, however, was rejected by the riksday of 1850. A strong Scandinavian movement manifested itself (especially in Denmark and Sweden, although the Norwegians also took part in it); great meetings of students were held, but no program for the unity of the Scandinavian countries with any real life in it was ever framed. When the Schleswig question led in 1848 to war between Denmark and the German states, a Swedish army was collected together in Skane and troops were carried over to Fven, in case Jutland should be invaded; but they never had occasion to come into action. During the Crimean War Sweden and Norway maintained neutrality. In Nov. 1855 they reaped the benefit: a treaty was concluded with England and France by which the union states undertook not to cede any portion of their territories to Russia while the two other powers undertook to prevent any Russian efforts in that direction (the November treaty), Side by side with the peace treaty in Paris there was concluded a separate agreement between Russia, France and England in which

Russia undertook not to fortify the Aland Islands.
The increasing consumption of sparts, as a result of the right to distil for household needs, called forth anxiety and led to a temperance movement conducted by persons such as Peter Wieselgren, a pastor. Pravte distilleries were done away with by the riksdeg of 1853-45 and the distilling of sparts was regulated by the state. Ever since the middle of the 197th century the question of temperature of the property of the state of the property of the state of the property of

perance has affected parties.

Charles XV.—The crown prince had conducted the government for two years, when he became high guider the name (Charles XV (1859-29). He was a fascinating man who by his liveliness of mind, personal friendliness and actisic temperament won great popularity, but he lacked the thoroughness and perseverance in work and the seriousness which are called for in a stateman. His undeniable gifts were bound up with an extravagant imagnation which in certain situations was a danger. This became most noticeable in the German-Danish war of 1865-64, when he gave the Danes dutincity to understand that they could count on an alliance between Denmark and Sweden-Norway, an idea which had never had the sanction of the state councils of either of the union countries and which was never to be realized. A number of Swedes, however, did enter the Danish army as volunteers.

The social changes which had come about in the life of Sweden necessitated a new form of electron representation, and increasingly the general feeling was that it must be solved by giving up the division into four estates and that a riksday with two chambers should be founded instead. The minister of justice, Louis de Geer (q,v), took the lead in the matter and the government submitted a bill in the riksday of 1856–56. The new constitution was finally accepted by all flour estates in the riksday of 1856–56.

and in Jan. 1867 the first riktdag of the new kind was assembled. It soon became evident that it was the peasants who had benefited most by the reform: within two years they dominated the second chamber and their party—the so-called Lantmanna party—was a power to reckon with.

Through the influence of the finance minister, Baron J. A. Gripenstedt, Sweden was led more in the direction of free trade, enstedt, Sweden was led more in the direction of free trade its treaty of commerce with France in 1865 was an epoch-making event in the development. All duties on grain were removed The right of trading was extended in 1864. Among more important reforms may be mentioned the criminal law and the manulaw of 1864. The wars which were in progress on the continencused the rakeage to grant large sums for armaments but the government's proposal for a reorganization of the national detenses was referred.

Oscar II.—After a prolonged illness Charles XV died in Sept 1872 and was succeeded by his brother Oscar II. The most noteworthy event in the latter's reign was the dissolution of the union

with Norway.

The union plans of 1815 were never quite clear, and great doubts had always existed regarding the documents in question and their precise bearing. The Norwegians, apprehensive of Swedish domination, had sought always to give the narrowest possible application to the provisions of the act of union, while the Swedes, gention to the provisions of the act of union, while the viewes, generally speaking, sought to give them a wider application, although with increased powers for Norway. The first great crisis arose over the question of the post of stathallare, or governor, of Norway At first this post had been held by Swedes, but as this had invited opposition they were succeeded by Norwegians. In 1850 the storting resolved to abolish the post altogether, but in Sweden it was contended that as the post was provided for in the act of union it could not be rejected by Norway alone. The question was shelved for a time, and in 1873 Oscar II sanctioned the resolution of the storting. The first great union committee had met in the 1840s and had been followed by several smaller committees and in the years 1865-67 by a great committee which worked out a plan for a new agreement between the two kingdoms. This, however, had been rejected by the storting in 1871. The position of the sovereign of the two kingdoms was now becoming extremely difficult, because modern parliamentarianism had progressed much further in Norway than in Sweden and the powers of the sovereign had consequently become much less extensive in Norway. Thus the king had been forced to make continual concessions to the Norwegians. In the year 1835 it had been decided that the premier or another member of the Norwegian government should be called into the Swedish-Norwegian ministerial council whenever questions concerning the foreign affairs of Norway alone or both kingdoms should be under discussion. In the 1880s a dispute arose about this joint ministerial council. From 1801 onward the storting demanded Norwegian consulates for Norway. Also, it reduced the annual grant for the court. Because of the protectionist demand of Sweden a Swedish-Norwegian joint law (dealing with reciprocal freedom from customs duties) ceased to exist in 1897. and in 1898 the king ratified a decision of the storting to remove the joint union emblem in the upper right-hand corner of the Norwegian flag; it disappeared afterward from the Swedish flag A small union committee put forward in 1902 a proposal for separate consular services but joint foreign office. Negotiations took place and in 1903 understanding seemed to be in sight. The Swedish plan provided that the foreign minister might be either a Norwegian or a Swede. But from both sides there came charges of breach of faith, and in Norway all parties demanded dissolution of the union. The Swedes were astonished when on June 7, 1905, the storting declared the union with Sweden to be dissolved. The riksdag acquiesced in the dissolution of the union upon certain conditions, such as that Norway should destroy certain frontier fortresses erected near the Swedish frontier, that the regions adjoining the frontier should constitute a neutral zone without fortifications and military manoeuvres, etc. King Oscar laid down the Norwegian crown on Oct. 26, 1905.

During the first years of King Oscar's reign, however, the question of national defense had been the dominant one, the first

chamber contending for an improved system and the peasant memhers in the second chamber making demands which could not for a long time be conceded. A number of aimy organization proposals were rejected, and during the 1880s the question of customs duties caused bitter disputes. The increasing exportation of grain from the United States and Russia together with the strong industrial competition among all countries resulted in a protectionist movement in Germany and France which extended also to Sweden. The second chamber was protectionist and the first in favour of free trade, in 1887 the majority in the first chamber was so small that it would have been possible to bring about a protectionist system by the collective vote of the two chambers king then dissolved the second chamber, which returned with a majority in favour of free trade The riksdag of 1888 on the other hand accepted the customs system, as the general election in the autumn of 1887-through a technical mistake in the election of the free-trade candidates in Stockholm-had given the protectionists a small majority. This issue had profound consequences both in the formation of parties in the second chamber and in other respects. New men came forward, the most conspicuous of whom was the landed proprietor E. G Bostrom, premier from 1891 to 1900 and 1902 to 1905 The question of the national defenses was provisionally settled by the riksdag's decisions in the autumn of 1801 (at an extraordinary session) and in 1901 In the latter year the Swedish military tenure established was completely abolished; the training time of the men hable for military service was increased from 90 to 240 days in the infantry and a longer period in the case of the navy and special branches of the army.

At this period new legislation was necessitated by industrial development and the great increase in the number of industrial workers. In 1881 the conditions of labour for children in all factories were regulated and in 1880 a law was passed on providing against injury while at work; the former law was amplified in 1900 by one dealing with the condition of industrial work for women and children. Trade unions were formed and collective agreements governing labour conditions were arranged between employers and workers. In 1880 a Social Democratic party was formed and in the autumn of 1896 Karl Hjalmar Branting was elected to the second chamber as its first Social Democratic member. The Liberals and Social Democrats demanded an extension of the suffrage for the second chamber, but it was not until the severance of the umon with Norway had given a strong impetus to a closer national union on new lines that the question came to be decided. The severance of the union led to the formation of the coalition ministry of Christian Lundeberg, a manufacturer, whose task it was to carry out the dissolution of the union He was followed at the close of the year 1905 by a Liberal ministry with Karl Staaff, a solicitor, as premier. The riksdag of 1906 rejected his suffrage bill, and the ministry resigned. Rear Adm. Arvid Lindman succeeded, with a Conservative ministry; he found a way, in 1907, of solving the suffrage question on the basis of universal and equal suffrage (with certain exceptions) together with the democratization of the communal scale of voting and proportional voting for both chambers. Among other important decisions may be mentioned the monopoly in the issuing of bank notes accorded to the Riksbank in 1897, the restriction of the right of companies to acquire land in northern Sweden in 1906, and the part ownership of the state in the Grangesberg company which owned the Lapland iron ore mines.

Gustav V to World War I (1914).—When Oscar II died on Doc. 8, 1907, the crown fell to his eldets on Gustav V. Modest and smple m his character, avoiding needless display, but capable of bearng himself with the dignity required by his postion, he proved a good king for a democratic epoch. Reforms were carried through, as, for instance, the laws on civil marriages in 1908 and for the protection of the peasants in Norrland in 1909. In the summer of 1909 the contra vinessed a great trial of strength between the industrial workers' trade unions and employers' associations, which culminated in an unsuccessful general strike.

In the autumn of 1911 the election for the second chamber was held with a doubled electorate and the Lindman ministry gave up office. Karl Staaff formed his second ministry. The Lindman

ministry had approved a cruiser of a new type but Staaff's government set asude th decision. A movement to cever the costs of its construction by private subscription produced a sum of 17,100-00 colkroner, and the ship was built. The people, indeed, had been dragmeted by the way in which the Russians were arming in Finland and with widesprared esponage by the Russians in Sweden, and new evidence of alarm was forthcoming in Feb. 19,14 when 30,000 peasants met in Stockholm to request the king that the whole question of national defense should be handled simultanetously. The king's answer was fravourable, and the Liberal ministry (which had passed a new law for workmen's protection in 1912 and introduced old-age pensions in 1913) resigned.

The king commanded the lowdshording Hjalmar Hammarskjold (v) to form a new ministry. K. A. Wallesherg became minister of foreign affairs The second chamber was dissolved and the rikedag reasembled after the election of May 1, 1074. The new government had a majority in the first chamber but not in the second.

World War I.—By World War I Sweden found itself more or less cut off from the western world, from which it had bought a large proportion of its food supplies, raw materials and finished goods. The war put an end to some of the party strife that had rent the country, particularly in connection with the strengthening of defense In due course Sweden declared its neutrality, measures for the reorganization of defense were passed, and Swednish neutrality was preserved all through the war despite extrainal and even some internal pressure by activists favouring one or the other sade. At the same time a common policy of neutrality bound the three Scandinavana states together and erased some of the hitter feelings between Sweden and Nova war assed some of

At first industry and commerce took an upward swing as a result of large purchases by the belligerents; soon, however, this intensive buying exhausted stocks which could no longer be replinished, and the export of some goods was made subject to licence. At the same time the state confiscated important goods at integ prices, distributing them by rationing, and took over creatin imports. Nevertheless, there was at times extreme shortage of some foodstuffy.

The Hammarskiöld government continued in office until 1917, when it resigned over the supply position. A Conservative ministry carried on until the general elections, which brought considerable gams for the Social Democrats. A Liberal-Socialist coalition under the Liberal Nils Eden took over, and Sweden's most famous Socialist, Hialmar Branting, entered the government for the first time The new government solved the supply problem by two agreements with Great Britain, the second one being the so-called modus vivendi agreement concluded in March 1918 The Russian Revolution, followed by the German, seriously affected Swedish thought and led to a revival of demands for a democratization of the constitution. As a consequence, a special session of the riksdag (urtima) passed a radical proposal that included inter alia votes for women. One effect of the bill was to make the Social Democrats the strongest party in the riksdag; the Conservatives were the second strongest, while the Liberals, who lost some seats, split into two groups in 1923—the National Liberals (Folkfrisinnade) and the Liberals-thereby further weakening their position. small Communist party and a Farmers' party were also formed

Another consequence of the Russian revolution, Finland's secession from the Russian empire, affected the Swedish scene. While the government recognized Finland's independence m Jan. 1918, it did not date grant military aid to the new aiton lest this should involve Sweden in the war or lead to difficulties at home—the sympathies of left-wing Social Democrats being with the soviets while a strong bourgeois opinion demanded aid for the tsarists. The government's decision adversely affected Finno-Swedish relations, and Finnish resentment was further increased by the dispatch of a Swedish awal expedition to the Aland Islands in Februarical of the Company of the C

retention of the islands did this resentment gradually die down
The Interwar Period.—The great advance of the Social
Democratic party was the most striking development between

World Wars I and II During the first decade, however, they were mainly jockeying for position.

In 1920 the Liberal-Socialist coalition was followed by the first purely Social Democratic government under Branting, but the autumn elections resulted in a small setback for his party, whereupon a "business" ministry of a moderately Conservative character carried on until after the elections of 1921, when Branting formed a new government This remained in office until 1923, to be followed by a series of short-term governments from the right or from the left, including a Liberal government under Carl Ekman that commanded only 33 votes and nevertheless carried on from June 1926 to the general elections of 1928. During this period the Social Democrats succeeded in passing a bill which greatly reduced armaments The Conservative ministry that followed Ekman's government had to deal with the effects on Sweden of the serious international grain crisis and passed legislation benefiting agriculture, only to be defeated over its proposal to increase the corn duties, whereupon another Liberal government took office in 1930 In 1932 Ekman resigned as he was involved in the scandal caused by the financial failure and suicide of Ivar Kreuger, prominent Swedish businessman, and after the autumn elections, which brought considerable gains to the Social Democrats and to the Farmers, the government resigned too.

In Oct. 1932 Per Albin Hansson formed his first ministry, with Rickard Sandler as foreign minister and Ernst Wigforss as finance minister. Its program included strong measures to overcome the depression, aiming however at financial expansion rather than economies The party was not strong enough to force these measures through the riksdag, and an arrangement with the Farmers-the so-called Kohandel-was concluded Against the combined votes of the two parties most affected by the depression, the opposition had to yield A conflict in the building industry at first slightly delayed recovery; but then general developments in industry began to justify the government measures, and unemployment began to fall steeply. Apart from a few months in 1934, when the Farmers governed alone, the Social Democratic partyeither alone or in coalition with others-remained in office throughout the ensuing period. In the elections of 1934 it nearly attained an over-all majority; but another coalition with the Farmers was formed, and this started a long series of strong governments (with Hansson as prime minister until his death in 1946). The government's policy was always prevention rather than cure of social and economic ills, and the country prospered accordingly. Consequently, National Socialism never really appealed to the Swedish people; no National Socialist was ever elected to the riksdag. At the same time the feeling of security of tenure that their strong position gave to the Social Democratic governments was reflected in the increasing atmosphere of calm that prevailed in labour relations and led to a standardization of the so-called collective agreements which by 1940 were covering about 1,000,000 workmen.

The Economic Position .- Sweden shared in the economic effects of the postwar crisis. Prices dropped quickly and war inflation was followed by deflation Early in 1922 unemployment rose to 160,000 and was fought by large-scale relief work By the close of 1922, however, the nadir had been reached, Sweden's recovery kept step with that of the world outside At the same time the democratization of the country increasingly affected the economic field. Labour had earlier been organized into trade unions and the co-operative movement flourished, but revolutionary ideas no longer prevailed and a policy of "progress by peaceful negotia-tion" was embarked upon. The eight-hour day was introduced without wage reduction, and despite shorter working hours production increased, largely because of modern business methods and mechanical improvements. Sweden's enormous untapped resources of water power were another contributing factor State railways were gradually electrified, road traffic was motorized and the merchant fleet substantially increased. Industry also progressed steadily. The production of pulp, one of Sweden's most important industries, was aided by improved forestry; agriculture

benefited by 1esearch on seed selections (largely carried out by Hermann Nilsson Ehle), and highly developed enganeering works produced increasing quantities of goods for export In addition, Sweden joined the countries which exported capital

During the depression in the early 1930s an agricultural crisis was followed by one in industry, the Kreuger scandal worsened the position still further, and unemployment assumed unusual proportions, leading to a number of grave labour conflicts Sweden followed Great Britain in abandoning the gold standard, which relieved the position temporarily; but when the Social Democratis resumed office in 1933 it was still serious and improved only gradually as the international economic position recovered

External Affairs -After the end of World War I Sweden became a faithful supporter of the League of Nations, prepared even to abandon something of the cherished policy of neutrality. However, the gradual deterioration of the international situation and the failure of the League to save Abyssinia had a sobering effect on Sweden The advent of National Socialism still further increased its apprehensions, and defense once again became a primary consideration-although a law passed in 1936 for the reorganization of the army aimed rather at modernization than at expansion When the Germans invaded Austria, Hansson proposed immediate increases in defense in open parliament, while the League was advised that Sweden proposed to resume its strict neutrality policy The fate of Czechoslovakia pointed the dan-ger still further The government declined Germany's offer of a nonaggression pact on the grounds that its declared policy of neutrality in any future conflict made such safeguard unnecessary. it unsuccessfully attempted to bring about closer relations with other Scandinavian governments and also tried to co-operate with Finland in a possible defense of the unfortified Aland Islands,

but this attempt foundered against soviet opposition World War II .-- World War II did not take Sweden by surprise The Social Democratic government immediately reiterated the country's official neutrality and took steps to strengthen defense. Negotiations moreover were opened with Great Britain resulting in a comprehensive war trade agreement in Dec 1939. The Russo-Finnish war placed Sweden in a difficult situation coalition government of all parties was formed with a nonparty foreign minister, Christian Gunther. Swedish feelings were deeply stirred, and "Finland's cause is ours" became the general watchword The material aid given to Finland was of unparalleled generosity and in the case of armaments endangered Sweden's own security, but Finnish requests for regular troops were refused, although volunteers for Finland were helped and encouraged. Conscious of the danger of German intervention, Alhed demands for the transit of British and French troops to Finland were also met with a firm refusal from Sweden as they were from Norway. The end of the Russo-Finnish war was a short-lived rehef for the whole north

The German invasion of Denmark and Norway isolated Sweden from the west. During the war in Norway the German government put heavy pressure on Sweden to allow the transit of troops and armaments, but it was only after the end of the war in Norway that Sweden entered into the agreement under which German soldiers on leave, and goods, including war material, were permitted to pass over certain Swedish railways. At the outbreak of the second Russo-Finnish war Sweden was forced to a still greater concession, when on June 25, 1941, permission for the transit of a whole armed division from Norway to Finland had to be granted These agreements aroused bitterness and widespread criticism in Sweden and were the subject of sharp Allied protests, although no action against Sweden was taken. When in 1043 Germany's position began to deteriorate and Swedish military strength had increased, the stoppage of the traffic was considered, and it came to an end in the late summer of that year. Until then Sweden, moreover, had been forced to supply Germany with iron ore and other important materials in exchange for the import of desperately needed essential goods, now stringent reductions in Swedish exports to Germany were made, and a comprehensive new war trade agreement concluded with Great Britain and the United States.

It should also be said that despite its precarious position Sweden succeeded in steering clear of all German attempts to persuade it to participate in the German "new order" policy and that all through the war, but especially during its latter part, it was a shelter for refugees from German oppression, not only Norwegnan, Danes and Finns, but also Balts and Jews of all nationalities After the war ended relief, largely in the form of credits, amounting to about £152,000,000 was extended mainly to Norway and Demmark, and medical supplies, food and clothing were sent wherever needed The Swedish Red Cross under Count Folks Bernadotte was actively engaged in adding prisoners of war and had the

government's generous support in these activities The Postwar Period.-After the war the Social Democrats dissolved the coalition and governed alone The first postwar elections in 1948 confirmed them as the strongest party. After abortive attempts to form a coalition with the Farmers they decided to continue alone, and results proved them right in this decision, The country had not yet recovered from the renercussions of the international crisis, and the unexpectedly slow recovery of devastated Europe, the cumulative effect of unfavourable world trends. Europe's growing economic dependence on the U.S and the temporary elimination of Germany from world trade seriously affected Swedish economy. To aid in the revival of Europe Sweden adopted a generous foreign credit policy When the expected revival did not materialize a serious economic crisis ensued in Sweden. Large cuts had to be made in imports and expenditure was reduced, although these reductions never affected social wel-

In Oct 1951 Tage Eflander, prime minister after the death of Hansson, formed another coaltinou with the Farmers From then until 1953 there were no major developments but the economic position gradually improved. The country as a whole apparently blamed the coalition for the high food prices, and the electrons in the autumn of 1952 resulted in slight losses for both government parties. The position of the parties in the lower house them was Social Democrates, 100 reseast (121 an 1984); Libbenls, \$5\$ (57); Conservatives, \$1\$ (23); Farmers, \$26\$ (30), and Communists, \$5(8).

Sweden joined the United Nations organization in 1946. The increasing tension between east and west confronted the government with serious problems, and the proposed formation of the North Atlantic treaty led to much heart searching. For once abandoning the old conception of neutrality. Sweden proposed in 1948 a common defense pact to Denmark and Norway. When this failed (largely because the U S, was unwilling to supply arms to such an organization), Sweden decided to revert to the tra-ditional policy and not to join the North Atlantic Treaty organization-a major reason for abstention being that adherence might indirectly affect Finland's difficult relations with the U.S.S.R It was fully understood, however, that only a strong defense could protect such neutrality, and increasing amounts were spent on armaments. In all other respects Sweden supported international co-operation, as for example by joining the Council of Europe and by taking an active part in the work of the Organization for European Economic Cooperation.

tion for European Economic Cooperation.

### POPULATION

The population of Sweden is low in comparison with the area of the country (44 per square mile) and unevenly distributed.

Table I shows the distribution of population in 1950 in the administrative districts (lan), which differ from the former division into provinces (landskap).

TABLE I - Area and Pobulation

Old provinces	Lan	Area (sq m1)	Population,

\*Including the island of Oland †With adjacent islets | Hachiding the four great lakes, Vaner, Vatter, Majar and Hjalmar, 3,505 30 mi

The total number of inhabitants was in 1950 about four times as large as it had been in 1750 (1,780,000) and twice what it had been in 1850 (3,480,000). The average annual excess of births was 7,86 per 1,000 in the 1961 hectury, reaching a maximum of 10,39 in the years 1841-60; in the 1930s it had fallen to 2,78, with a minimum of 2 og in 1935. There was a rise during World War II culminating with 9,57 in 1945. After that it diminished again, being 6 4 in 1950

Emigration, sepecially to the United States, increased rapidly from 1860 onward, with a maximum during the period 1881-90 (average 38,000 a year). Then the U S legislation on immigration and also the attainment of a comparatively high standard of living in Sweden in the years after Woold War I caused a decline in the number of emigrants, and in the 1940s there were practically

The immgrants were at earlier periods considerably fewer, but they exceeded the emigrants during World War I and after 1930. The highest figure after World War II was approximately 33,000 in 1948. Besides the large number of refugees, many immgrans were attracted by the favourable conditions for obtaming employment, and skilled labourers (particularly from Italy and Germany) were offered employment through the intermediacy of the government

In 1950 there were 3,510,000 male and 3,540,000 female inhabitants. The population is racially more homogeneous than in most other countries. There were in 1950 about 34,000 Finns living in the frontier region and 5,300 Lapps in the far north

Population is denser in the south than in the north: in Dec. 1950 Malmohus Jan had about 260 persons per square mile and Norrhottens Ian 6. The annual excess of births over deaths in 1941-45 was about 66,050, or 03 per 1,000. The low birth rate of the 19,08 was one of several reasons for expecting the working population to be stationary up to 1960, when the lincrease in the birth rate that took place during and after World War II should begin to have its effect upon the abour market.

The uwhan population was 47% of the total in 1950. Up to 1860 this percentage had remained nearly stationary at about 11, 1870-ing subsequently with the progress of the industrialization. Stocholm, the capital of Sweden, had in 1951 as population of about \$200,000 (spread over the whole metropolitan area), Glotchorg about 560,000 and Malmo nearly 200,000. Nortkoping, Heising-borg, Orebro, Uppsala, Vasterns and Linkoping had each between 50,000 and 100,000 inhabitants In all, there were about 70 towns with more than 10,000 inhabitants.

Religion.—More than 99% of the total population belongs to the Established Church of Sweden, which is Lutheran and has the king as its supreme head. Among the minorities the Jews (about 6,700 in 1950) and the Roman Catholies (5,500) are the most important. There are also certain rather important "free-church movements" (numbering about 400,000 adherents), many of which are recognized within the Estabhished Church. Freedom to leave the Estabhished Church without joining a "foreign religious community" (1 e , without becoming a Jew, a Roman Catholic, a Methodist Episcopalian or a Swedenborgian) was introduced at the beginning of 1952 but did not seem to bring about any immediate Consequence.

With the archbishop of Uppsala as primate, the Established Church of Sweden is divided into 13 dioceses each headed by a bishop. The church parishes number 2,500.

Baugation—Public elementary education became free and compulsory in 1842 Besides the two old universities in Uppsala and Lund, there are universities in Stockholm and in Gotoborg Stockholm has also special graduate schools of technology, forestry, commerce, educative, the stockholm has also special graduate schools of technology and commerce; and Malmo has a graduate school of densities, for advanced studies in social work and public administration, there are special institutes in Stockholm, Lund and Gotoborg. Self-education is an outstanding feature in Swedish cultural life nearly 3,000 study or crede were an action in 1925, with students numbering about 340,000. Considerable government subsidies are given for this form of adult education as well as for popular lectures

People's colleges, the first of which date from the 1860s, provide a special type of voluntary education for persons about 20 years of age Organzed as boarding schools, many of them are sponsored by political parties, by bodies concerned with the labour

market or by popular movements

Social Welfare.—About 10% of the national income is used for welfare and social security, including maternity benefits, child allowances, old-age pensions, rent relates to large families, free school luncheau and school books and equipment. A considerable share of the costs of medical care and of sickness and accident insurance (about one-third of the total social budget) is met by the state. On May 27, 1953, the riksdeg approved a far-reaching compulsory health insurance sheme

Conditions on the labour market are often regulated by voluntary decisions taken jointly by leading organizations concerned (the central body of trade umons, the central body for the professions, certain agricultural organizations and the employers 'union'). In In this way it was agreed in 1964 that 'enterprise councils' should be introduced into industry. Working hours, vacations (three weeks') path followly, safety arrangements and other provisions for protecting the workers, collective bargaining and rights of association are settled by law

Traditions and Recreations—In some parts of Sweden— Dalecarlia, Varnland, Gotland—old customs are well preserved and picturesque peasant costumes still sometimes worn at festivals. Christmas is the main festival of the year. People dance round Maypoles on Midsummer's Eve and light bonlines on the eve of May day. Of later origin are the celebrations for the "queen of lights" (St. Lucia) on Dec. 13.

Special dishes include hard rye bread in flat cakes (knackbrod) and amorgashorf, an hors d'ouver consisting of different kinds of snacks (herring, salmon, eel, salads, shees of meat, etc.) and often served at the beginning of a meal with bread and butter and, sometimes, a glass of hupor (snapp). In view of the social evils associated with drunkenness prohibition was suggested by the temperance movement in 1910, but was rejected by a plebisset in 1922. Ivan Bartis' system of rationing, introduced in 1917, subjected the purchase of liquor to severe control by law. Wine and beer are consumed in small quantities, and there are limitations on

BURG'LICENSING SWITMA)

Swedish gymnastics since the time of Per Henrik Ling  $(q \ v)$ , have had a world-wide following. The National Athletic association, formed by the various clubs, has a total membership of about 600,000. Other favourtie forms of sport in Sweden are sking, skating, ice hockey, bandy (an ice game with a bell), salling, rifle shooting and track finding. Lawn tennis had a special patron in

the consumption of strong liquor at restaurants. (See "Gothen-

King Gustavus (Gustaf) V and became increasingly popular. Association football, however, is now the most popular sport.

## GOVERNMENT, JUSTICE AND DEFENSE

Sweden is a limited monarchy, the constitution resting primarily on the Constitution act (Regeringsformen) of 1809. June 6, the day of enactment and also the day when Gustavus Vasa entered Stockholm in 1523, is now celebrated as Sweden's national day The throne is hereditary but may be occupied only by male members of the royal family The executive and judicial authority is vested in the king alone, but his resolutions must be countersigned by a member of the cabinet (statsrad). The cabinet is appointed by the king and is responsible to the parliament (riksdag), without the consent of which it cannot act. The government consists of a prime minister (statsminister): the heads of the 11 departments of administration, which are justice, foreign affairs, defense, social affairs, communications, finance, church and education, agriculture, commerce, interior affairs, civil services, and three or four ministers without portfolio Administrative posts are equally open to men and women Holders of government offices are appointed by the king Apart from provincial governors and a few others, who are as a rule appointed for a period of six years, Swedish civil servants are undismissable except in case of default and after trial and judgment. The central administration outside the ministries is on the whole independent of politics. which usually play little part in appointment to government offices. The cabinet shares legislative powers with the riksdag and introduces new bills in it; and their members have also the right to introduce new bills In order to take effect legislative bills must be approved by the government as well as by the riksdag By the 1950s the general tendency in the Swedish political life seemed to be toward increasing the influence of the government, which for the two preceding decades had been based on a majority in the riksdag.

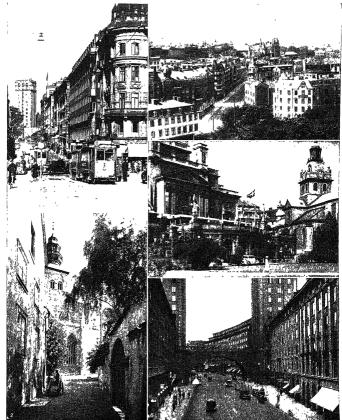

The riksdag is bicameral. Members of the upper chamber (150 seats), who sit for eight years, are elected by the town and county councils, and one-eighth of their number stands for election every year. The 230 members of the lower chamber are elected every year. The 230 members of all men and women over 12 years of age (universal suffrage dates from 1521). Candidates must be 35 years old to be eligible to the upper chamber, 23 to be eligible to the lower. The two chambers have equal authority and their agreement is required to enact a bill

Amendments to the constitutional law, in which siter alia the freedom of the press is guaranteed, must be decided twice by the riksdag and the cabinet in two different sessions with a general election intervening. There are nine standing joint commit-

tees for different fields of legislation.

Local Government.—Sweden is divided into 25 administrative districts or ian (see Table 1). The chief official of the lan is the governor (landshovding), appointed by the king in council. Under him is the administrative board of the district with executive, fiscal and civil defense functions and control over the "local" police (under the ultimate authority of the ministry of the interior). Whereas these are the local branches of the state administration, there is on the other hand a far-reaching local self-government in the parshes, dealing inter aids with health and sanitation, poor relief, education, fire and certain police work. Matters relevant to larger areas are decided upon by the representative bodies of the land (landsting). An average parish has a few thousand inhabit and; the areas represented by the landsting have several hundred thousand. The local units have the right to decide upon their own taxes to raise what money they need.

Justice.—Justice is administered by tribunals of three instances. In the first place there are 116 rural judicula circuits (domsgor), the court of which (haradsratt) consists of a judge and from seven to nine lay assessors (nonndemen), who assist the judge with information and advice regarding the case. If seven out of eight or mne assessors present are unaumously of a different opinion from the judge, they can outvote him; but this seldom occurs. The town courts, called radhurratt, consist of the mayor (who in Sweden is a judge, not a chief of the local government) and at

least two aldermen; they have assessors only in serious criminal

Second, there are six courts of appeal (hovratter), which are established in Stockholm, Jonkoping, Malmo, Umea, Goteborg and Sundsvall

Third, the supreme court (hogsta domstoles) passes sentences in the name of the king, who is sominally the highest pudical authority. Cases dealing with administrative name eventually referred to the supreme administrative toward eventually referred to the supreme administrative court (regengeraties), but there is no court trial of the constitutionality of administrative decisions. After 1948, when fegal proceedings were reformed, argument was in principle oral rather than written.

Defense.—Sweden's armed forces consist of three services, the army, the navy and the air force. The command of all armed forces is held by the lung and, under him, by the supreme commander, who has the defense staff at his disposal, co-ordinates the activity of the three services and directs military planning. Military service is compulsory for all males between 20 and 47 years of age; about 4,000 conscrited become liable every year

In the army the preparatory training lasts to to 11 months (1952), to be supplemented later by three operational training courses each of one month's duration and with an average interval of six years. In wartime the army comprises about 600,000 men mobilizable in a short time. The home guard is an integral part of the army and recruitment is voluntary, its members being mostly drawn from the age groups under 20 or over 47.

The navy, which includes the coastal artillery, consists of 3 armoured coast-defense ships, 4 cruises, 2 of destroyers and fast fingates, 21 motor toppedo boats, 24 submarines and about 100 small surface vessels. A program confirmed in 1092 subpulsed that 61 light vessels were to be constructed by 1050. The coastal artillery is responsible for the defense of harbours, anchorages and potential invasion areas. Its permanent installations are as a rule blasted into the rock.

The air force in 1952 comprised 50 squadrons, 30 of which consist of day fighters, 3 of night fighters, 12 of attackers and 5 of ieconnaissance aircraft. It was resolved that the transition to fet propulsion should be effected by the middle of the 1950s.

The armed forces are supported by various voluntary defense associations comprising several hundred thousand men and women, they make increasing use, for example, of the Swedish women's volunteer service. Equipment is to the greatest possible extent designed and constructed by Swedes. Every Swedish citizen between 16 and 65 years of age who does not belong to the armed forces may have to serve in the civil defense, which is trained in peacetime to be responsible in war for first aid, clearing and fire services as well as for protection against chemical and biological warfare. Air-aid shelters are often basted into the rock in an endeavour to give protection even against atomic bombs.

### ECONOMY

An important change in the structure of Swedish economic life took place after the 1870s. In those years about 7-% off the population carned its living from agriculture, but in 1951 less than 30% did so. During the same period industry increased its proportion from 15% to 41% of the population, becoming in the process the most important source of national wealth. The corresponding figures for commerce and communications are 5% (1870) and 20% (1945).

Agriculture.-Less than 10% of the whole area of Sweden is under cultivation, with the main agricultural regions in the south and around the big lakes in central Sweden; natural meadowland covers about 3% More than half the land area is covered by forests, the rest is mountainous and barren Sweden is practically self-sufficient as far as agricultural products are concerned. The yield per acre is high and exceeded by few countries in Europe Wheat cultivation, through scientific plant breeding, has been extended almost to the Arctic circle and is superseding the cultivation of rve Sugar beets are grown in southern Sweden and on the islands of Oland and Gotland, the crop being nearly equal to the domestic demand. After the outbreak of World War II homegrown oil plants provided raw material for making margarine and fodder cakes Nearly 50% of all agricultural income is derived from milk and milk products After 1030 and particularly after World War II a large-scale mechanization and modernization took place within Swedish agriculture; the number of tractors in use grew from 2.100 in 1030 to 10.100 in 1030 and from 21.300 in 1045 to 76,200 in 1952, when there were, moreover, about 10,000 light tractors; and between 1044 and 1048 there were notable increases in the numbers of combines (from 407 to 2.100), mechanical binders (from 71,000 to 86,300) and milking machines (from 40,000 to 62,700) in use The government encourages small farms to pool their machinery, and nearly every farmer is a member of the producers' co-operative groups for marketing agricultural products, About 90% of the arable area is privately owned, and not more than 20% of it is held on lease Of the 414,000 farms, about 75% had in 1944 less than 25 ac of arable land, while less than 2% had 125 ac. or more. In central and northern Sweden the farms mostly include some forest The principal aim of Swedish agricultural policy is to further the creation of larger operative units Industry.-The bases of Swedish industry are the forests, the

Industry.—The bases of Swedish industry are the forests, the iron ore deposits, the water power and the technical skill of the workers Between 1955 and 1950 the volume of industrial production was doubled, and between 1900 and 1950 it grew sevenfold. Small enterprises predominate. (See Table II)

Larger firms with international reputations include A B Svenska Kullagerfabriken (S.K.F.), which makes ball bearings; Svenska A.B. Gassccumulator (A.G.A.), which makes automatic beacons; A.B. Separator; A B. Slektrolux, which makes refrigerators; and A.B. dc Lavals Angturbin and Svenska Turbilafbriks A.B. Ljungstrom, which make steam turbines. The largest industrial concern is the Swedish Electric company, A.S.E.A. The telephone system in many toreign countries is technically administered by Telefon A.B. I. M. Ericsson or its subsidiaries.

By far the greater part of Swedish industry is in private hands, Of the industrial workers only 5% are employed in governmentowned factories and 4% in co-operative enterprises; thus privately owned firms employ or % of industrial workers.

Timber and Wood Products.—Forests, mainly pine, cover about 8,700,000 sqim, or more than 50% of the surface area of Sweden. Current annual growth available to the timber industry is estimated at 60,000,000-70,000,000 cuyd. Cutting and conservation are regulated by law, and large-scale scientific research is conducted by experimental stations and institutes with a view to increasing the yield per acre. One-half the forest area is owned by private persons, one-fourth by companies, one-fifth by the state and the rest by the church and local communities. After the outbreak of World War II the industry was concerned to supply not only the traditional timber, pulp, paper and board but also more

valuable products such as rayon, alcohol, plastics, dyes, glue, resns, turpentine, etc. In 1948 the output of sulphite cellulose was 1,350,000 tons, sulphate cellulose, 980,000 tons; paper, 970,000 tons; mechanical pulp, 680,000 tons, sawn pine timber, 3,200,000 cum; and planed boards, 1,40,000 cu m.

Iron—Sweden's iron ore deposits are among the richest in the world. They consist of the long-worked mines in central Sweden (Bergslagen; estimated deposits 220,000,000 tons) and of the later workings in northern Lapland (Kirunavara, Gallivare, etc.; estimated deposits 2,000,000,000 tons). The domestic iron industry uses mainly ore from Bergslagen, which contains a singularly pure fron. The Lapland mines, the ore of which is phosphorus bearing but very rich in inco content (50% to 70%), are worked for export. More than 90% of the output of iron ore is exported, about 13,000,000 tons were exported in 1951. Of Europe's total resources in ore of high ron content, more than 90% is to be found in the Lapland mines. There are also some ore deposits containing gold, silver, copper and arsenic; also zan or is mund.

Finel and Power—Sweden's coal deposits, which are found only in the south, normally produce not more than 300,000 tons a year, together with firebrick and fire clay, though output was doubled during World War II Imports of coal and coke were estimated to amount to 7,200,000 tons per year in the 1950s, theirly from England, Poland and the German Federal Republic In addition, approximately 1,00,000 tons of crude oil and 2,000,000 tons of motor and combustible oil were imported. Wood and peat are also used as fuel. But electric power has more and more replaced fuel in homes as well as in industry.

After Switzerland and Norway, Sweden has the world's highest consumption of electricity per person. It was planned that the installed hydroelectric capacity in 1952 should amount to about half the total estimated potential of \$,00,000. We The output of energy was 9,000,000,000 km km, per year before World War II and was estimated at 2,000,000 for 1953, after the harnessing of about half the ensting water-power resources. More than half the electric power is supplied by private companies. The trunk transmission line from Harspranget in the far north to central Sweden, opened in 1952, first in the world to have a voltage as hugh as \$80,000 has a transmission capacity between two and three times as high as that of lines with a voltage of 190,000.

Foreign Trade.—The value of Sweden's foreign trade (export and import) per inhabitant is relatively high. In 1950 it was about the same as in Great Britain, Table III shows how this foreign trade is distributed.

In tariff policy Sweden is very little given to protectionism. Communications—More than 50% of Sweden's imports and exports are transported on Swedish vessels. The merchant navy grew considerably in the course of the soft centurry, with a gross tonnage of somewhat more than 2,00,000 in 1957, if put Sweden in the sixth place among the world's seafaring nations or, if we reckon according to the relation of the tonnage to the population, in the fourth (after Norway, Great Britain and Denmark). In 1951 more than half the tonnage was engaged in ocean trading, on regular runs to all parts of the world. One of the foremost ship-

building nations, Sweden is considerably exceeded only by Great Britain in the amount of tonnage launched (more than 400,000 tons in 1951, mostly for foreign owners).

In 1950 the Swedish, Norwegian and Danish commercial air lines were merged into one company, the Scandinavian Airlines System (S A.S.).

Sweden possesses a highly developed network of railways, the oldest of which date from the riscos From the beginning the state took an active part in the construction of trunk times. The total length of the lines amounts to about 10,000 mm (more in relation to the population than that of any other European country), of which about 40% has been electrified (this portion hower accounted for 86% of the total traffic in 1051). An act of partiament of 1039 provided for the gradual nationalization of railways that were still privately owned. Ferres connect the railways with continental lines through Demmark and Germany

The total length of public roads is about \$8,000 mi, national highways covering a,700 m. and provuncial highways 124,00 ft bis total 3,400 mi are paved. Motor vehicles registered in 1952 comprised \$9,000 trucks, 7,800 butses and 31,5000 cars (including 10,000 taxicabs). The density of population being so low, bus lines are naturally of great importance to Sweden.

In 1950 Sweden had 1,600,000 telephones, or 228 per 1,000 inhabitants, which as the second highest proportion in the world. The number of radio sets in relation to the population is surpassed only by the United States. There is only one broadcasting system (Radiotjans!), it is partly state-owned and nonpolitical and carries no advertising in its program. There are about 250 newspapers, of which approximately 150 are dailies (around 20 appear also on Sundays). Their total circulation is 5,300,000 copies The Liberal press covers more than half the circulation.

Finance.—The state budget is divided into two parts, the budget of current expenditure and the capital budget, the latter being in principle devoted to government investments (which are covered by national loans). Government expenditure amounted to 1,349,000,000 kronor in the budgetary year 1938–39, to 4,103,000,000 in 1944–45, to 5,449,000,000 in 1950–51 and to 6,600,000 in 1931–52. Whereas the expenditure of 1951–52 was nominally 4.9 times that of 1938–39, the increase in real terms was only by 2.4 times if the consumption price index is used as a base. The gross national income, calculated at factor cost by calendar years, rose from 12,060,000,000 known in 1939 to 36,800,000,000 in 1951; the slight effect of World War II may be judged from the index series 1939 = 100, 1948 = 150, 1945 = 153, 1951 = 305. Details of revenue and expenditure may be seen in Table IV, which gives the budget estimate for 1923–53.

The total national debt, which in the 1930s was still comparatively small, increased during World War II from 3,000,000, 000 to 11,000,000,000 kronor and amounted in 1931 to about 12, 500,000,000. The gross national income was in 1950 estimated to be about 32,000,000,000 kronor.

The unit of currency is the krona (plural, kronor). Its exchange rate against the pound sterling was 145 kronor = £1 in 1952 (cf. 16.92 kronor = £1 before 1940); against the U.S. dollar the rate was 5.18 kronor = \$1 in 1952 (cf. 3.60 kronor = \$1

before devaluation in 1949).

The Swedish credit market is characterized by the multiplicity of types of credit institutions, official, semiofficial and private, among which the distribution of the functions and of the operating fields is not always clearly defined. The Bank of Sweden (1657), which is the oldest national bank in the world, is subordinated to the riksdag and not to the government There were 19 commercial banks in 1052. Two of these Syenska Handelsbanken and Skandinaviska Banken, held each about one-quarter of the assets of the whole commercial banking system; two others, Stockholms Enskilda Bank and Goteborgs Bank, held about one-tenth, and the fifth largest was state-owned. Whereas these five have a more or less nation-wide network of branch offices, the other commercial banks are regional or local. Savings banks numbered about 450 in 1952, the total of deposits in them amounting to not much less than that in the commercial banks. Special state organizations supervise the activities both of the commercial and of the savings banks. Mortgage loans are advanced by a number of special institutions (for housing, agriculture, shipping, etc.).

of special institutions (for housing, agriculture, shipping, etc.).

SWEDENBORG or SWEDBERG, EMANUEL (1688-1772), Swedish scientist, philosopher and theologian, born at Stockholm on Jan. 29, 1688. His father, Jesper Swedberg, subsequently professor of theology at Uppsala and bishop of Skara, was under suspicion of heterodoxy, as he placed more emphasis on the cardinal virtues of faith, love and communion with God than on dogma. On completing his university course at Uppsala in 1710, Emanuel travelled in England, Holland, France and Germany, studying natural philosophy and writing Latin verses, a collection of which he published in 1710. In 1715 he returned to Uppsala, devoting himself to natural science and engineering. From 1716 to 1718 he published a scientific periodical, Daedalus hyperboreus, a record of mechanical and mathematical inventions and discoveries. In 1716 Charles XII appointed him assessor extraordinary on the Swedish board of mines. Two years later he distinguished himself at the siege of Frederikshall by the invention of machines for the transport of boats overland from Stromstadt to Iddefjord, a distance of 14 mi. At the death of Charles XII Queen Ulrica Leonora gave him a patent of nobility, by which his name was changed from Swedberg to Swedenborg, the "en" corresponding to the German "von." In the Swedish house of nobles he spoke on economic subjects-the currency, the decimal system, the balance of trade and the liquor laws (where he was the pioneer of the Goteborg system). He strongly opposed a bill for increasing the power of the crown. The next years were devoted to his official duties, which involved visiting the Swedish, Saxon, Bohemian and Austrian mines. In 1724 he declined the chair of mathematics in the University of Uppsala, on the ground that it was a mistake for mathematicians to be limited to theory. As early as 1721 he was seeking a scientific explanation of the universe, when he published his Prodromus principiorum rerum naturalium, and had already written his Principia in its first form. In 1734 appeared in three volumes Opera philosophica et mineralia, the first volume (his Principia) containing his view of the first principles of the universe, predicting the nebular hypothesis and some of the modern ideas on the atom The other volumes dealt with (1) iron and steel, (2) copper and brass, their smelting, conversion and assaying, and chemical experiments thereon

Swedenborg's volumnous writings were not properly collected and examined until toward the end of the right century; it was then seen that in almost every department of scientific activities were shown to prove the was ahead of his time. He work on palacenology's shows him the predecessor of all the Scandinavian geologists. He was also a great physiciat and had arroved at the nebulan hypothesis theory of the formation of the planets and the sun long before Kant and Laplace, he write a bucd account of the phenomena of phosphorescence, and adduced a molecular magnetic theory which antespated some of the chief features of modern hypotheses. The French chemist Jean Dumas credits him with the first attempt to establish a system of crystallography. He was first to employ mercury for the air pump, and devised a method of determining longitude at sea by observations of the mono among the stats

In 1734 he published Prodromus philosophiae ratiocinantis de infinito et causa finali creationis, which treats of the relation of the finite to the infinite and of the soul to the body, seeking to establish a nexus in each case as a means of overcoming the difficulty of their relation. From this time he applied himself to discovering the nature of soul and spirit by means of anatomical studies. He travelled in Germany, France and Italy in search of anatomical knowledge and, as a result, published his Oeconomia regni ammalis (London, 1740-41) and Regnum ammale (The Hague, 1744-45; London, 1745). In no field were Swedenborg's researches more noteworthy than in physiological science. 1901 Max Neuberger of Vienna called attention to certain anticipations of modern views made by Swedenborg in relation to the functions of the brain, and the University of Vienna appealed to the Royal Swedish academy for a complete issue of the scientific treatises. Swedenborg showed (150 years before any other scientist) that the motion of the brain was synchronous with the respiration and not with the action of the heart and the circulation of the blood, a discovery the full bearings of which are still unrealized. He arrived at the modern conception of the activity of the brain as the combined activity of its individual cells. The cerebral cortex and, more definitely, the cortical elements (nerve cells) formed the seat of the activity of the soul, and were ordered into departments according to various functions. His views as to the physiological functions of the spinal cord were in agreement with later research, and he anticipated modern research on the functions of the endocrine glands.

At middle age, Swedenborg left the domain of physical research for that of psychical and spiritual inquiry. Late in life he wrote to Oetinger that "he was introduced by the Lord first into the natural sciences, and thus prepared, and, indeed, from the year 1710 to 1745, when heaven was opened to him." Before his illumination he had been instructed by dreams, and enjoyed extraordinary visions and heard mysterious conversations. According to his own account, the Lord filled him with His spirit to teach the doctrines of the New Church by the word from Himself; He commissioned him to do this work, opened the sight of his spirit and so let him into the spiritual world, permitting him to see the heavens and the hells and to converse with angels and spirits for years; but he never received anything relating to the doctrines of the church from any angel but from the Lord alone while he was reading the word (True Christian Religion, no. 779). He elsewhere speaks of his office as principally an opening of the spiritual sense of the word. In 1747 he resigned his post of assessor of the board of mines, took up afresh his study of Hebrew and began his voluminous works on the interpretation of the Scriptures.

Between 1756 and 175e three instances of supernormal cognition were attested of him; for an account of them and of Kant's interest in them see C. D. Broad, "Immanuel Kant and Psychical Research," Proceedings of the Society for Psychical Research (London, 1950). His life theneoforth was spent alternately in Sweden, Holland and London, in the composition of his works and their publication, till his death, which took place in London on March 29, 1772. He was burried in the Swedish church in Princes square, St George's-in-the-East, and on April 7, 1908, his remains were removed at the request of the Swedish government to Uppsala cathedral.

Swedenborg never attempted to preach or to found a sect. He believed that members of all the churches could belong to the New Church without forming a separate organization His theosophic system is most briefly and comprehensively presented in his Divine Love and Wisdom The point of view from which God must be regarded is that of His being the Divine Man. His esse is infinite love, His manifestation or body is infinite wisdom Divine love is the self-subsisting life of the universe. From God emanates a divine sphere, which appears in the spiritual world as a sun, and from this spiritual sun proceeds the sun of the natural world. The spiritual sun is the source of love and intelligence, or life, and the natural sun the source of nature or the receptacles of life, the first is alive, the second dead The worlds of nature and spirit are perfectly distinct, but they are intimately related by analogous substances, laws and forces. In God there are three infinite and uncreated "degrees" of being, and in man and all things corresponding three degrees, finite and created They are love, wisdom, use; or end, cause and effect. The final ends of all things are in the Divine Mind, the causes of all things in the spiritual world, and their effects in the natural world. By a love of each degree man comes into conjunction with them and the worlds of nature, spirit and God The end of creation is that man may have this conjunction and become the image of his Creator and creation. In man are two receptacles for God-the will for divine love and the understanding for divine wisdom-that love and wisdom flowing into both so that they become human.

Swedenborgianism is based on the belief in Swedenborgs claims to have winessed the last judgment, or the second advent of the Lord, with the inauguration of the New Church, through the new system of doctrine promulgated by him and derived from the Scriptures, into the true sense of which he was the first to be introduced. The doctrines of the New Church as given in the Liturgy (which also contains the "Creed" and "Articles of Faith") are as follows:

are as follows:

1. That there is one God, in whom there is a Divine Trinity; and

that He is the Lord Jesus Christ.

2 That a saving faith is to believe on Him.

3 That evils are to be shunned, because they are of the devil and from the devil.

4. That good actions are to be done, because they are of God and from God.

From June 5. That these are to be done by a man as from himself; but that it ought to be believed that they are done from the Lord with him and by him.

and by him.

Swedenborgians constitute a widely spread and considerable society, with a regularly constituted ecclesiastical organization and a zealous missionary activity (see New Jerusalem Church).

a zealous missionary activity (see New JERUSALEM CHUKCH).
BIRLIGORAPHT—Lithographed facsimiles of the manuscripts of
Swedenborg's works were edited by R. L. Tafel, 10 vol. (Stockholm,
1869-70); another edition in 18 vol. was published at the same place
(1901-16). Numerous editions of the single works have appeared in

Irmitation & See R. L. Tafel, Documents Concerning the Life and Character of Swedenborg, collected, translated and annotated, 3 vol. Swedenborg Society (1857-7); I. Iyade, A Blogneyhy of Swedenborg, Swedenborg Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, Swedenborg, State Swedenborg, Sweden

SWEDISH LANGUAGE AND LITERATURE. The Swedish language is about 1,000 years old. It began in the viking age when the Scandinavian national states first emerged, and the characteristic features which separate the modern Scandinavian languages developed. Old Swedish was originally spoken in languages developed. Old Swedish was originally spoken in Sweden itself—excepting the most northerly and southerly parts and certain western areas—in the coastal belts of Finhand, Estonia and Livouia, with their islands, and in certain parts of Russia conquered by vikings, who here and there maintained themselves until the 15th century. In the modern world it is used by about the 15th of the 15th of 15

The ultimate ancestor of Swedish is Common Norse, one branch of the family of Germanic languages commonly divided into three

groups (1) East Germanic (Gothic); (2) West Germanic (Dutch, English, Frisian and High German), and (3) North Germanic ie, Scandinavian (Swedish, Danish, Icelandic, Norwegian and Faroese) Swedish with Danish form the East Scandinavian group, the three others are West Scandinavian Modern Swedish. though still more inflected than contemporary Danish or Norwegian, has dropped a great many of the inflections current, in some instances, into the 18th century (see below). The verbs are di-vided into four conjugations, the nouns into five declensions and the gender of these nouns into common (den) and neuter (det) Only two case forms have survived for the nouns, nominative and genitive The genitive is formed by adding s to the nominative both in the definite and indefinite form, both in singular and plural; thus dag, dags, dagens, dagar, dagars, dagarnas As an example of the changed forms compare singular nominative definite dagen with the classical Old Swedish daghr-in, dagens with daghsins, dagarna with dagha-nir, dative form daghum-in and accusative dagha-na; cf Anglo-Saxon daeg (modern English "day"), German Tag and Danish dag The adjectives are declined according to gender, number and definite and indefinite forms Examples of the sound mutations between Danish and Swedish are Danish gade and Swedish gata ("street"), Danish bog and Swedish bok (book)

(book)
Runes—Runes are the oldest form of Swedish writing About
2,500 runic inscriptions survive from the earliest period of formsvenska (c. A. 56.00-1225); most of them are found in Uppland
and date from the rith and rith centuries. Cut in stone, often
put into metrical form, they commemorate the genealogy and
achievements of the dead. The most remarkable stone, Rökstenen
in ötetgogloand, dates from the gith century and is unique in the
length and interest of its inscriptions, written in seven different
types of script. Other interesting inscriptions have been found
in Hälsungland, including the Nalstadsten, in the so-called "staffless" script. Unfortunately, save for the runes, nothing of the
earliest Swedish literature has survived, but it is likely that there
was some sort of literary culture akin to that of Iceland.

# CLASSICAL PERIOD OF OLD SWEDISH

We possess a greater and more reliable knowledge of Swedish after the religious orders (first Casterclans, later Domnicans) had introduced the Latin alphabet, orignally for the transcription of religious texts, and had founded schools to assist their mission-ary work. The earliest examples of Latin letters are on coins of the time of Olaf Skotkonung (993–1022). Then follows the classical period of Iold Swedish (c. 1225–1373), with the beginnings of a native literature, inferior in quality and volume to that of Ledand. The purest Swedish language of this time is highly inflected, uses simple constructions and is surprisingly free from foreign influences, the few Greek or Latin loan words generally relating to church matters. Nouns have four cases, the sufficed article is inflected, and there is also much infliction of verbs.

The oldest extant manuscript in classical formsumska is not a translation from Latin, but part of a native legal code, Frienghalagent, compiled in the 1200, A number of such local codes survive; e.g., Scistpladagen, Daldalagen, records of provincial laws set down by a magistrate and preceding the lawbooks like Upplandslagen (1206) and Södermanslagen (1337), compiled on official initiative and ratified by the king. These codes are forceful and full of concrete images; they often use alliteration and solemn prose rhythm to make their pronouncements more memble. They offer the happiest examples of the vermacular interature in their age, and culminate im Magnus Eriksson's Londslag (On the Conduct of Kings and Princes), probably written about 1330 for the guidance of the same ruler. This reflects both Swedish respect for law and the influence of Christian culture, even of scholasticism.

Dialects.—Differences of dialect occur in the runic inscriptions and in these legal codes, as in other products of this old literature. Two main groups of Swedish dialects, each comprising a number of subdivisions, have been classified: the Swea group, including the northern areas, Uppland, Hälsingland, etc., and parts of öster-

götland; the Gota group comprising Värmland, Vastergötland, complete translation of the Bible (Gustav Vasas Bibel, 1541), conparts of Småland, etc , and more recently the south Swedish provinces, which till long after the Reformation were Danish-speaking regions The archaic language of Gotland is excluded from this classification. Even in the period of Old Swedish it differed so fundamentally from the Swedish of the mainland that forngutniskan ranked as a separate language. It may be studied in about 200 rume inscriptions and a 13th-century Gutalag

Religious and Secular Literature.-The importance of Christianity in the cultural development of Sweden is immense, yet the new religion prevailed only gradually, and pagan rites existed well into the middle ages and in remote districts for much longer. Slowly, too, the primitive society of viking times was replaced by a more complex organization, dominated by the nobility and the clergy, patrons and providers of literature Latin eclipsed the vernacular as a literary medium, and this helps to explain the derivative nature of mediaeval Swedish letters. Thus, though the poetry of chivalry reached Sweden, the Swedish writings inspired by chivalrous ideals were mere free adaptations of French or German originals Eufemiausorna, the best-known of these works, three verse romances translated anonymously between 1303 and 1312, are in rhymed doggerel, a metre again employed in the chronicle romance Erikskromkan, a record of the fortunes of the Swedish kings between 1220 and 1320, probably compiled soon after the latter date. An anonymous and hybrid work, it is the most powerful single poem of mediaeval Sweden.

Only in religious writing, from among unknown Latin hymn writers, compilers of logendaries, etc., do a few personalities emerge. The Dominican Petrus de Dacia (c 1235-80), with his Vita benedictae virginis Christi Christinae, is often considered the first Swedish author; Bishop Brynolf Algotsson (c. 1250-1317) is the first distinguished Latin hymn writer in Sweden. But both were overshadowed by St. Bridget (c. 1302-73), the founder of Vadstena monastery. Only the Latin version of her text, the Revelationes, survives, first printed at Lubeck in 1492.

### YOUNGER OLD SWEDISH

The downfall of the Folkunga dynasty and the death of Bridget mark the end of a period Under the impact of the stormy Unionstiden, with its foreign rulers, the character of society and of language changes, and we get the yngre fornsvenskan (c. 1375-1526), a language diluted with German loan words-mostly technical and commercial terms-and with Danicisms, which sheds a number of its inflections. At the same time there occurs a standardization of the literary language, largely under the influence of Vadstena kloster, the main focus of culture in Sweden until the Reformation. Both Latin and German affected the syntax of the vernacular

Literature.- The insecurity of these times had an adverse effect on literature, yet with the growth of a reading public, translations and adaptations multiplied. They included versions of books of the Bible, a long doggerel romance of Alexander (c. 1380) and a political allegory, the poem Schacktavelslek (The Game of Chess, c. 1465). In the rhymed chronicles, too-e.g., Karlskrömkan, Sturekrómkan and Lilla Rimkrönikan (which treats events up to 1520)-political interest prevails. Of greater literary value are the Latin hymn Rosa rorans bonitatem by Bishop Nicolaus Hermanni (1326-91) and the two short lyrics Frihetsvisan and Trohetsvisan that have earned for Bishop Thomas Simonsson (c. 1380-1443) the title of the first Swedish national poet Yet the most accessible genre of Swedish mediaeval letters-the folkvisor (ballads or folk songs)-is anonymous and undated. The oldest probably go back to 1300, but they were not transcribed until much later. Though outnumbered by the Danish, and often deriving from Danish or Norwegian sources, many of the Swedish folkvisor have a strong and lasting appeal.

## EARLY NEW SWEDISH (c. 1526-1700)

As Gustavus Vasa's accession (1523) and the breach with Denmark mark the beginning of modern Swedish history, so the printed translation of the New Testament (1526) is considered to usher in den didre nysvenskan. Yet in both this work and the servatism is visible in the word order and in the maintenance of inflections already shed in less solemn contexts The translators excluded the Danicisms typical of the kanslisprak (clerical style), but were much influenced by Luther. Still, a standardized literary riksspråk does grow up during this period, and an increase of interest in grammai, vocabulary and orthography is visible during the 17th century. The centralization of government in Stockholm and the influence of the court affected both the written and spoken noims, while Swedish intervention in the Thirty Years' War led to the assimilation of many foreign words.

Literature of the Reformation.-The Reformation stimulated no immediate growth of letters, such books as appeared were still mainly religious and didactic Closely involved in the Bible translations were Olaus Petri (c 1493-1552), his brother Laurentius (d 1573), the first Lutheran archbishop, and Laurentius Andreae, at one time Gustavus' chancellor. Of these, Olaus seems to have had the most robust personality. After studying at Wittenberg he returned to Sweden full of reforming zeal, which won him the king's favour; later, his independence and critical spirit nearly cost him his life. His vigorous approach is revealed in his published sermons, in his hymn translations, in catechism and in legal writings; it is shown, too, in his Swensk kronika, the first authentic historical work in Sweden, far surpassing the official chronicle of Peder Swart. Petri may have written the biblical Tobie comedia (1550), the first complete extant Swedish play.

Uppsala university (founded 1477), closed in 1517 because of political unrest, was not revived until late in the 16th century and became a focus of learning and letters only in the 17th century. Johannes Rudbeckius, one of the first Swedish educators, was associated with it, and so was Johannes Messenius (1579-1636), who wrote several mythical-historical plays, such as Disa (1611) and Sigmil. Although formless and crude these plays enjoyed great popularity, as did Magnus Olai Asteropherus' more successful Tisbe (1610), the first nondidactic drama in Swedish

In the first half of the 17th century literature remained limited in scope and quantity. Some Latin poetry, the sermons of Rudbeckius and a handful of plays-including Judas Redivivus (1614) by I. Rondeletius, Gustaf den forste by A. Prytz and some comedies by J. Chronander-are worth recording. A unique contribution, however, was made by the vagrant adventurer Lars Wivallius (1605-60), whose lyrics, many of them written in prison, reveal a feeling for nature new to Swedish poetry.

Literature of Stormaktstiden, 1650-1730 .- With its intervention in the Thirty Years' War and the ensuing military triumphs, Sweden established itself as a European power (Stormakt) This led to a great development of national pride and culture that is revealed in the literature of this epoch. The first and probably the best work is Georg Stiernhielm's allegorical epic Hercules, written about 1647 in vigorous hexameters. Stiernhielm (1598-1672) was the greatest literary figure of the 17th century. His followers include the two brothers Columbus, of whom Samuel (1642-71) was Stiernhielm's secretary and wrote Odae susticas and the prose Målroo eller Roomål, a charming collection of anecdotes which illumine Stiernhielm's character. A rival to Stiernhielm was the unidentified "Skogekar Bergbo," whose Wenerid (1650; published 1680) was the first sonnet cycle in Swedish. Another unsolved problem of this period is the authorship of the epithalamium Brillopsbeswärs Ihugkommelse, a realistic poem long attributed to Stiernhielm. Several of Stiernhielm's admirers, including Urban Hiärne (1641-1724), formed a coterie at Uppsala in the 1660s. Hiärne led a troupe of student actors who in 1665 performed his play Rosimunda before the young Charles XI. He also tormed his play Accommense beaute the young chanted stat. And we wrote lyrics and the pastoral Stratonice (1666-68), the first Swedish "psychological" narrative.

Stiernhielm was eager to revive old Swedish words and eliminate

foreign loans. Columbus also demanded a more vigorous, flexible language for prose and poetry, as did "Skogekar Bergbo" in Thet swenska språketz klagomål. National pride and religious feeling are combined in the works of the bishops Haqvin Spegel (1645-1714) and Jesper Swedberg (1653-1735) father of Emanuel Swedenborg Both were hymn writers and ardent philologists. Spegel wrote a selfgrous epic, Gudz work och kwule (1685) and sponsored the plan for a new hymnhook whoch appeared in 1695 and became the petry book of the Swedish people, and, like Gustav Vauxa Babba, of lasting findiunen. Even Lara Johansson (1683-24, pessudonym "Lucidor") was represented therein This poet, though one of the most attractive fyricts of the period, otherwise stands apart from the general development, some of his poems have survived in a postthumous collection, Rélecons blomburs aves survived in a postthumous collection.

At Uppsals meanwhile the scholar Petrus Lagerlof (1628–69) worked on poetus and attempted to impose classical standards, and O Verelus (1618–82) edited and translated Icelandic tagas. Olius Rudbeckus (1636–710.), a man of vest energy and learning, became interested in Verelus' work on antiquities and entusastacily developed the theory that Sweden was the lost Atlants and had been the cradle of western cuitation These theories he launched in a massive work Atland eller Manhem (1679–170.) deliberately written in Swedish to prove that the language was suited to scientific purposes. The work was translated into Laint a Atlantica and attained Eurocana fame

Rudbeckus had encouraged Hinare's actors. Lagerlof now sponsored a scond Uppsais company, which moved to Stockholm in 1686 and acted in Leponkulan (the "Lion's Dea"). This became Sweden's first regular (though short-head) theatre in "Leponkula" plays show little dramatic talent but reveal how Lagerlift's technip had produced more correct verse.

Baroque tendencies are found in the work of some late 17thcentury poets, notably Gunno Eurelius (ennobled as Dahlstiera, 9.0) (1661-1709), who dedicated his elaborate Kunguskuld (1697) to Charles XI J Runius (1697-1713) expresses a Christian stoticism found among the Swedish people during the disastrous early decades of the 18th century. J Frese (1691-1793) is a genifier and more intimate poet; his jivrica and hymns contain some of the emotional pietism that became a feature of 18th-century thought.

#### MODERN NEW SWEDISH (c. 1700 AND AFTER)

Den yngre nysvenskan is the form of Swedish now current; it is intelligible (except for a few words and expressions) to a modern reader without commentary Olof von Dalin's Then swänska Argus is the first important literary work in this form, During the 18th century several grammars and dictionaries contributed to standardization, and the Swedish academy (founded 1786) was given the task of "working for the purity, strength, and sublimity of the language" It issued a grammar in 1836, but its dictionary (Svenska Akademiens ordbok) did not appear until the 1890s. Meanwhile, C. G. af Leopold of the academy had published (1801) a treatise on spelling involving the radical Swedicizing of foreign words, especially the numerous French loans absorbed during the previous century. Few changes in orthography occurred during the 19th century; the most recent spelling reform was made in 1906. The importance of the written language increased after 1850; it was much affected by the press (dating, in a modern sense, from the foundation of L. Hierta's Aftonbladet in 1830), and the gap between the spoken language of educated men, modelled on the written norm, and the printed word was gradually reduced. An important aspect of this tendency was the speech usage whereby the singular form of the verb was employed with a plural subject, this became the norm of the press in the 19405.

Literature, 1730–1809.—After the death of Charles XII (1718) and the collapse of hie empire, a more vitiliarian attitude to life and letters gradually set in. Old von Dalin (q v), (1708–66) is the outstanding popularizer of the new ideas of French and English Enlightenment. Educated at Lund university (founded 1663), he later went to Stockholm and began to publish, anonymously, Thes. sodwinks Agray, modelled on Joseph Addison and Justus van Ellen, almost the first serious journalistic venture in Sweden. In forceful, supple prose, Dalin riddiciel the foblise of the capital. Sagas on histon (The Story of the Hortes, 1740) showed his mastery of allegorical satire, occasional verses and songs his skill as a lyric poet. He became a court poet and favour-tie and a member of Queen Lovisa's Vitterhetskademi (1753).

In spite of the increasing secularization of literature during Prihestitides (1718–72), the drama still lacked life; neither Count Karl Gyllenborg's comedy Den seenske spitathoken (The Swedish Fop. 1737) nor O Celsius' tragedy Ingeborg has more than historic interest
